orientation is generally observed, but in France and Italy there are many variations. In Scotland it was the custom to fix a pole in the ground over night, and in the morning to note the direction taken by the shadow of the pole, which was followed when setting out the axis of the choir. If such a custom had been followed in an early church, when setting out another of later date there should be some difference in the orientation of the two, on account of the variation of the obliquity of the ecliptic in the interval, and this in some cases accounts for the change of the axial line which is found in some churches, either when the east end has been rebuilt, as was constantly the case throughout Europe, or when a nave has been added to an earlier structure. In describing churches it is usual to use the terms east, west, north and south, on the assumption that the altar is at the east end, although this may not be the real bearing of the edifice.

Indirectly also the term is sometimes used in the planning of houses and the relation of the windows of the various rooms to the sunshine and the weather—in other words, to the points of the compass; thus an eastward aspect should be provided for the morning- and dining-rooms, a south-western aspect for the drawing-room, a westward for the library, and north by west for the kitchen, larder, &c.

ORIENTE, or LA REGION ORIENTALE, a large undefined territory of Ecuador, comprising all that part of the republic lying east of the Andes. Pop. (1887 estimate), 56,000. The territory was formed in 1884 from the older territories of Napo, Cañar, and Zamora, but its boundaries with the neighbouring republics of Colombia and Peru are disputed. The territory is covered with great forests, inhabited by wild Indians, and its climate is hot and exceptionally humid. There are some mission settlements and trading stations in the Andean foothills and on some of the river courses, one of which is Archidona, on a small tributary of the Napo, which is the nominal capital.

ORIGEN (c. 185-c. 254), the most distinguished and most influential of all the theologians of the ancient church, with the possible exception of Augustine. He is the father of the church's science; he is the founder of a theology which was brought to perfection in the 4th and 5th centuries, and which still retained the stamp of his genius when in the 6th century it disowned its author. It was Origen who created the dogmatic of the church and laid the foundations of the scientific criticism of the Old and New Testaments. He could not have been what he was unless two generations before him had laboured at the problem of finding an intellectual expression and a philosophic basis for Christianity (Justin, Tatian, Athenagoras, Pantaenus, Clement). But their attempts, in comparison with his, are like a schoolboy's essays beside the finished work of a master. Like all great epoch-making personalities, he was favoured by the circumstances of his life, notwithstanding the relentless persecution to which he was exposed. He lived in a time when the Christian communities enjoyed almost uninterrupted peace and held an acknowledged position in the world. By proclaiming the reconciliation of science with the Christian faith, of the highest culture with the Gospel, Origen did more than any other to win the Old World to the Christian religion. But he entered into no diplomatic compromises; it was his deepest and most solemn conviction that the sacred oracles of Christendom embraced all the ideals of antiquity. His character was as transparent as his life was blameless; there are few church fathers whose biography leaves so pure an impression on the reader. The atmosphere around him was a dangerous one for a philosopher and theologian to breathe, but he kept his spiritual health unimpaired, and even his sense of truth suffered less injury than was the case with most of his contemporaries. To us, indeed, his conception of the universe, like that of Philo, seems a strange medley, and one may be at a loss to conceive how he could bring together such heterogeneous elements; but there is no reason to doubt that the harmony of all the essential parts of his system was obvious enough to himself. It is true that in addressing the Christian people he used different language from that which he employed to the cultured; but there was no dissimulation in that—on the contrary, it was a requirement of his system. Orthodox theology has never, in any of the confessions, ventured beyond the circle which the mind of Origen first measured out. If he surpassed and despised his author, he has expunged his heresies; but whether he has put anything better or more tenable in their place may be gravely questioned.

Origen was born, perhaps at Alexandria, of Christian parents in the year 185 or 186. As a boy he showed evidence of remarkable talents, and his father Leonidas gave him an excellent education. At a very early age, about the year 200, he listened to the lectures of Pantaenus and Clement in the catechetical school. This school, of which the origin (though assigned to Athenagoras) is unknown, was the first and for a long time the only institution where Christians were instructed simultaneously in the Greek sciences and the doctrines of the holy Scriptures. Alexandria had been, since the days of the Ptolemies, a centre for the interchange of ideas between East and West—between Egypt, Syria, Greece and Italy; and, as it had furnished Judaism with an Hellenic philosophy, so it also brought about the alliance of Christianity with Greek philosophy. Asia Minor and the West developed the strict ecclesiastical forms by means of which the church closed her lines against heathenism, and especially against heresy; in Alexandria Christian ideas were handled in a free and speculative fashion and worked out with the help of Greek philosophy. Till near the end of the 2nd century the line between heresy and orthodoxy was less rigidly drawn there than at Ephesus, Lyons, Rome, or Carthage. In the year 204 persecution arose, in which the father of Origen became a martyr, and the family lost their livelihood. Origen, who had distinguished himself by his intrepid zeal, was supported for a time by a lady of rank, but began about the same time to earn his bread by teaching; and in 203 he was placed, with the sanction of the bishop Demetrius, at the head of the catechetical school. Even then his attainments in the whole circle of the sciences were extraordinary. But the spirit of investigation impelled him to devote himself to the highest studies, philosophy and the exegesis of the sacred Scriptures. With indomitable perseverance he applied himself to these subjects; although himself a teacher, he regularly attended the lectures of Ammonius Saccas, and made a thorough study of the books of Plato and Numenius, of the Stoics and the Pythagoreans. At the same time he endeavoured to acquire a knowledge of Hebrew, in order to be able to read the Old Testament in the original. His manner of life was ascetic; the sayings of the Sermon on the Mount and the practical maxims of the Stoics were his guiding stars. Four oboli a day, earned by copying manuscripts, sufficed for his bodily sustenance. A rash resolve led him to mutilate himself that he might escape from the lusts of the flesh, and work unhindered in the instruction of the female sex. This step he afterwards regretted. As the attendance at his classes continually increased—pagans thronging to him as well as Christians—he handed over the beginners to his friend Heracles, and took charge of the more advanced pupils himself. Meanwhile the literary activity of Origen was increasing year by year. He commenced his great work on the textual criticism of the Scriptures; and at the instigation of his friend Ambrosius, who provided him with the necessary amanuenses, he published his commentaries on the Old Testament and his dogmatic investigations. In this manner he laboured at Alexandria for twenty-eight years (till 231–232). This period, however, was broken by many journeys, undertaken partly for scientific and partly for ecclesiastical objects. We know that he was in Rome in the time of Zephyrinus, again in Arabia, where a Roman official wanted to hear his lectures, and in Antioch, in response to a most flattering invitation from Julia Mammæa (mother of Alexander Severus, afterwards emperor), who wished to become acquainted with his philosophy. In the year 216—the time when the imperial executioners were ravaging Alexandria—we find Origen in Palestine. There the bishops of Jerusalem and Caesarea received him in the most friendly manner, and got him to deliver public lectures in the churches. In the East, especially in Asia Minor, he was still no unusual thing for
lsamen, with permission of the bishop, to address the people in the church. In Alexandria, however, this custom had been given up, and Demetrius took occasion to express his disapproval and recall Origen to Alexandria. Probably the bishop was jealous of the high reputation of the teacher; and a coolness arose between them which led, fifteen years later, to an open rupture. On his way to Greece (apparently in the year 230) Origen was ordained a presbyter in Palestine by his friends the bishops. This was undoubtedly an infringement of the rights of the Alexandrian bishop; at the same time it was simply a piece of spite on the part of the latter that had kept Origen so long without any ecclesiastical consecration. Demetrius convened a synod, at which it was resolved to banish Origen from Alexandria. Even this did not satisfy his displeasure. A second synod, composed entirely of bishops, determined that Origen must be deposed from the presbyterial status. This decision was communicated to the foreign churches, and seems to have been justified by referring to the self-mutilation of Origen and adding objectionable doctrines which he was said to have promulgated. The details of the incident are, however, unfortunately very obscure. No formal excommunication of Origen appears to have been decreed; it was considered sufficient to have him degraded to the position of a layman. The sentence was approved by most of the churches, in particular by that of Rome. At a later period Origen sought to vindicate his teaching in a letter to the Roman bishop Fabian, but, it would seem, without success. Even Heracles, his former friend and sharer of his views, took part against him; and by this means he procured his own election shortly afterwards as successor to Demetrius.

In these circumstances Origen thought it best voluntarily to retire from Alexandria (231-232). He betook himself to Palestine, where his condemnation had not been acknowledged by the churches any more than it had been in Phoenicia, Arabia and Achaia. He settled in Caesarea, and very shortly he had a flourishing school there, whose reputation rivalled that of Alexandria. Origen's literary work too was prosecuted with unabated vigour. Enthusiastic pupils sat at his feet (see the Pomegry of Gregory Thaumaturgus), and the methodical instruction which he imparted in all branches of knowledge was famous all over the East. Here again his activity as a teacher was interrupted by frequent journeys. Thus he was for two years together at Caesarea in Cappadocia, where he was overtaken by the Maximian persecution; here he worked at his recension of the Bible. We find him again in Nicomedia, in Athens, and twice in Arabia. He was called there to combat the unitarian christology of Beryllus, bishop of Bostra, and to clear up certain eschatological questions. As he had formerly had dealings with the house of Alexander Severus, so now he entered into a correspondence with the emperor Philip the Arabian and his wife Severa. But through all situations of his life he preserved his equanimity, his keen interest in science, and his indefatigable zeal for the instruction of others. In the year 230 the Decian persecution broke out, Origen was arrested, imprisoned and maltreated. But he survived these troubles—it is a malicious invention that he recanted during the persecution—and lived a few years longer in active intercourse with his friends. He died, probably in the year 254 (consequently under Valerian), at Tyre, where his grave was still shown in the middle ages.

Writings.—Origen is probably the most prolific author of the ancient church. "Which of us," asks Jerome, "can read all that he has written?" The number of his works was estimated at 6000, but that is certainly an exaggeration. Owing to the increasing unpopularity of Origen in the church, a comparatively small portion of these works have come down to us in the original. We have more in the Latin translation of Rufinus; but this translation in by no means trustworthy, since Rufinus, assuming that Origen's writings had been tampered with by the heretics, considered himself at liberty to omit or amend heterodox statements. Origen's real opinion, however, may frequently be gathered from the Philočara—a sort of anthology from his works prepared by Basil the Great and Gregory Nazianzenus. The fragments in Photius and in the Apolation of Pamphilus serve for comparison. The writings of Origen consist of letters, and of works in textual criticism, exegesis, apologetics, dogmatic and practical theology.

1. Eusebius (to whom we owe our full knowledge of his life) collected more than a hundred of Origen's letters, arranged them in books, and deposited them in the library at Caesarea (H. E. vi. 36). In the church library at Jerusalem (founded by the bishop Alexander) there were also numerous letters of this father (Euseb. H. E. vi. 20). But unfortunately they have all been lost except two—one to Julius Africanus (about the history of Susanna) and one to Gregory Thaumaturgus. There are, besides, a couple of fragments.

2. Origen's textual studies on the Old Testament were undertaken partly in order to improve the manuscript tradition, and partly for apologetic reasons, to clear up the relation between the LXX and the original Hebrew text. The results of more than twenty years' labour were set forth in his Hexapla and Tetrabibla, in which he placed the Hebrew text side by side with the various recensions, and explained the differences. This work was published in detail, and tried to find the basis for a more reliable text of the LXX. The Hexapla was probably never fully written out, but excerpts were made from it by various scholars at Caesarea in the 4th century; and thus large sections of it have been saved.† Origen worked also at the text of the New Testament, although he produced no recension of his own.

3. The exegetical labours of Origen extend over the whole of the Old and New Testaments. They are divided into Scholia (σημειώσεις, short annotations, mostly grammatical), Homilies (edifying expositions grounded on exegesis), and Commentaries (τροχούς). In the Greek original only a very small portion has been preserved; in Latin translations, however, a good deal. The most important parts are the homilies on Jeremiah, the books of Moses, Joshua and Luke, and the commentaries on Matthew, John and Romans. With grammatical precision, antiquarian learning and critical discernment Origen combines the logical method of interpretation—the logical corollary of his conception of the inspiration of the Scriptures. He distinguishes a threefold sense of scripture, a grammatical-historical, a moral and a pneumatic—the last being the proper and highest sense. He thus set up a formal theory of allegorical exegesis, which is not quite extinct in the churches even yet, but in his own system of fundamental importance. On this method the sacred writings are regarded as an inexhaustible mine of philosophical and dogmatic wisdom; in reality the exegete reads his own ideas into any passage he chooses. The commentaries are of course intolerably diffuse and tedious, a great deal of them is now quite unreadable; yet, on the other hand, one has not unfrequently occasion to admire the sound linguistic perception and the critical talent of the author.‡

4. The principal apologetic work of Origen is his book κατὰ Λόγον (eight books), written at Caesarea in the time of Philip the Arabian. It has been completely preserved in the original. This work is invaluable as a source for the history and situation of the church in the 2nd century; for it contains nearly the whole of the famous work of Celsius (Ἄρωγος ἀνρήστη) against Christianity. What makes Origen's answer so instructive is that it shows how close an affinity existed between Celsius and himself in their fundamental philosophical and theological presuppositions. The real state of the case is certainly unsuspected by Origen himself; but many of his opponent's arguments he is unable to meet except by a speculative reconstruction of the church doctrine in question. Origen's apologetic is most effective when he appeals to the spirit and power of Christianity as an evidence of its truth. In details his argument is not free from sophistical subterfuges and superficial reasoning.†

5. Of the dogmatic writings we possess only one in its integrity, and that only in the translation of Rufinus; τὰ Προτεστάται ἡ Περί Ἀπολογίας ἢ περὶ ἀπολογίαν (On the Fundamental Doctrines). This work, which was composed before 228, is the first attempt at a dogmatic at once scientific and accommodated to the needs of the church. The material is drawn from Scripture, but in such a way that the propositions of the regula fidei are respected. This material is then formed into a system by all the resources of the intellect and of speculation. Origen thus solved, after his own fashion, a problem which his predecessor Clement had not even ventured to grapple with. The first three books treat of God, the world, the fall of spirits, anthropology and ethics. “Each of these three books really embraces, although not in a strictly comprehensive way, the whole scheme of the Christian view of the world, from different points of view, and with different contents.” The fourth book explains the divinity of the Scriptures, and deduces rules for their interpretation. It ought properly to stand as first book at the beginning. The ten books of Stromata (in which Origen compared the teaching of the Christians with that of the philosophers, and corroborated all the Christian dogmas from Plato, Aristotle, Numenius and Cornutus) have all perished, with the exception of small fragments; so have the tracts on the resurrection and on free-will.2

The practical theological works we have still the Προτεστάται εἰς ἡμᾶς and the Σαλπιγγία. For a knowledge of Origen’s Christian estimate of life and his relation to the faith of the church these two treatises are of great importance. The first was written during the persecution of Maximinus Thrax, and was dedicated to his friends Ambrosius and Protocetus. The other also dates from the Caesarean period; it mentions many interesting details, and concludes with a fine exposition of the Lord’s Prayer.

7. In his own lifetime Origen had to complain of falsifications of his works and forgeries under his name. Many pieces still in existence are wrongly ascribed to him; yet it is doubtful whether a single one of them was composed on purpose to deceive. The most noteworthy are the Dialogues of a certain Adamantius “de recta in Deum fide,” which seem to have been erroneously attributed to Origen so early as the 4th century, one reason being the fact that Origen himself also bore that name. (Eusebius, H. E. vi. 14.)

Outline of Origen’s View of the Universe and of Life.—The system of Origen was formulated in opposition to the Greek philosophers on the one hand, and the Christian Gnostics on the other.3 But the science of faith, as expounded by him, bears unmistakably the stamp both of Neo-Platonism and of Gnosticism. As a theologian, in fact, Origen is not merely an orthodox traditionalist and believing emperor, but a peculiarly strong exponent of Neo-Platonic tendencies. He is, moreover, a judicious critic. The union of these four elements gives character to his theology, and in a certain degree to all subsequent theology. It is this combination which has determined the peculiar and varying relations in which theology and the faith of the church have stood to each other since the time of Origen. That relation depends on the predominance of one or other of the four factors embraced in his theology.

As an orthodox traditionalist Origen holds that Christianity is a practical and religious saving principle, that it has unfolded itself in an historical series of revealing facts, that the church has accurately embodied the substance of her faith in the regula fidei, and that simple faith is sufficient for the renewal and salvation of man. As a philosophical idealist, however, he transmutes the whole contents of the faith of the church into ideas which bear the mark of Neo-Platonism, and were accordingly recognized by the later Neo-Platonists as Hellenic.4 In Origen, however, the mystic and ecstatic element is held in abeyance. The ethico-religious ideal is the sorrowless condition, the state of superiority to all evils, the state of order and of rest. In this condition man enters into likeness to God and blessedness; and it is reached through contemplative isolation and self-knowledge, which is divine wisdom. “The soul is trained as it were to behold itself in a mirror, it shows the divine spirit, if it should be found worthy of such fellowship, as in a mirror, and thus discovers the traces of a secret path to participation in the divine nature.” As a means to the realization of this ideal, Origen introduces the whole ethics of Stoicism. But the link that connects him with churchly realism, as well as with the Neo-Platonic mysticism, is the conviction that complete and certain knowledge rests wholly on divine revelation, i.e. on oracles. Consequently his theology is cosmological speculation and ethical reflection based on the sacred Scriptures. The Scriptures, however, are treated by Origen on the basis of a matured theory of inspiration in such a way that all their facts appear as the vehicles of ideas, and have their highest value only in this aspect. That is to say, his gnosticism neutralizes all that is empirical and historical, if not always as to its actuality, at least absolutely in respect of its value. The most convincing proof of this is that Origen (1) takes the idea of the immutability of God as the regulating idea of his system, and (2) deprives the historical “divine human flesh” of all significance for the true Gnostic.

To him Christ appears simply as the Logos who is with the Father from eternity, and works from all eternity, to whom alone the instructed Christian directs his thoughts, requiring nothing more than a perfect—i.e. divine—teacher. In such propositions historical Christianity is stripped off as a mere husk. The objects of religious knowledge are beyond the plane of history, or rather— in a thoroughly Gnostic and Neo-Platonic spirit—they are regarded as belonging to a supra-mundane history. On this view contact with the faith of the church could only be maintained by distinguishing an exotic and an esoteric form of Christianity. This distinction was already current in the catachetical school of Alexandria, but Origen gave it its boldest expression, and justified it on the ground of the incapacity of the Christian masses to grasp the deeper sense of Scripture, or unravel the difficulties of exegesis. On the other hand, in dealing with the problem of bringing his heterodox system into conformity with the regula fidei he evinced a high degree of technical skill. An external conformity was possible, inasmuch as speculation, proceeding from the higher to the lower, could keep by the stages of the regula fidei, which had been developed into a history of the world; “The system itself aims in its simplest form and most suggestive mode of nothing, was regarded merely as the sphere in which souls are punished and purified, the system is pervaded by a strongly dualistic element. The immutability of God requires the eternity of the Logos and of the world. At this point Origen succeeded in avoiding the heretical Gnostic idea of God by assigning to the Godhead the attributes of goodness and righteousness. The pre-existence of souls is another inference from the immutability of God, although Origen also deduced it from the nature of the soul, which as a spiritual potency must be eternal. Indeed this is the fundamental idea of Origen— the original and indestructible unity of God and all spiritual essences.” From this follows the necessity for the created spirit, after apostasy, error and sin, to return always to its origin in God. The actual sinfulness of all men Origen was able to explain by the theological hypothesis of pre-existence and the premundane fall of each individual soul. He holds that freedom is the inalienable prerogative of the finite spirit; and this is the second point that distinguishes his theology from the heretical Gnosticism. The system unfolds itself like a drama, of which the successive stages are as follows: the transcendential fall, the creation of the material world, inaugurating the history of punishment and redemption, the clothing of fallen souls in flesh, the dominion of sin, evil and the demons on earth, the appearing of the Logos, His union with a pure human soul, His esoteric preaching of salvation, and His death in the flesh, then the imparting of the

1 There are, however, extensive fragments of the original in existence.
2 *Schrader, Hellenizing, Origenis de principiis, 1st ed. (Leipzig, 1836); Schnitzer, Orig. über die Grundlehren des Glaubens, an attempt at reconstruction (1835).
3 The opposition to the unitarians within the church must also be kept in mind.
4 *Porphyry says of Origen, κατὰ τὰς προτεστάταις καὶ τῶν θεοῦ δόγματα Ἐξελίξεως (Euseb. H. E. vi. 19).
Spirit, and the ultimate restoration of all things. The doctrine of the restoration appeared necessary because the spirit in spite of its apparent freedom, cannot lose its true nature, and because the final purposes of God cannot be foiled. The end, however, is only relative, for spirits are continually falling, and God remains through eternity the creator of the world. Moreover the end is not conceived as a transfiguration of the world, but as a liberation of the spirit from its unnatural union with the sensual. Here the Gnostic and philosophical character of the system is particularly manifest. The old Christian eschatology is set aside; no one has dealt such deadly blows to Chiliasm and Christian apocalypticism as Origen. It need hardly be said that he spiritualized the church doctrine of the resurrection of the flesh. But, while in all these doctrines he appears in the character of a Platonic philosopher, traces of rationalistic criticism are not wanting. Where his fundamental conception admits of it, he tries to solve historical problems by historical methods. Even in the christology, where he is treating of the historical Christ, he entertains critical considerations; hence it is not altogether without reason that in after times he was suspected of "Ebionitic" views of the Person of Christ. Not unfrequently he represents the unity of the Father and the Son as a unity of agreement and harmony and "identity of will."

Although the theology of Origen exerted a considerable influence as a whole in the two following centuries, it certainly lost nothing by the circumstance that several important propositions were capable of being torn from their original setting and placed in new connexions. It is in fact one of the peculiarities of this theology, which professed to be at once churchly and philosophical, that most of its formulae could be interpreted and appreciated in irdamque partem. By arbitrary divisions and rearrangements the doctrinal statements of this "science of faith" could be made to serve the most diverse dogmatic tendencies. This is seen especially in the doctrine of the Logos. On the doctrine of the Logos God Origen was obliged to insist in the strongest manner on the personality, the eternity (eternal generation) and the essential divinity of the Logos. 1 On the other hand, when he turned to consider the origin of the Logos he did not hesitate to speak of Him as a κρίσεα, and to include Him amongst the rest of God's spiritual creatures. A κρίσεα, which is at the same time ὑπολογια τῷ Θεῷ, was no contradiction to him, simply because he held the immutability, the pure knowledge and the blessedness which constituted the divine nature to be communicable attributes. In later times both the orthodox and the Arians appealed to his teaching, both with a certain plausibility; but the inference of Arius, that an imparted divinity must be divinity in the second degree, Origen did not draw. With respect to other doctrines also, such as those of the Holy Spirit and the incarnation of Christ, &c., Origen prepared the way for the later dogmas. The technical terms round which such bitter controversies raged in the 4th and 5th centuries are often found in Origen lying peacefully side by side. But this is just where his epoch-making importance lies, that all the later parties in the church learned from him. And this is true not only of the dogmatic parties; solitary monks and ambitious priests, hard-headed critical exegetes, allegorists, mystics, all found something congenial in his writings. The only man who tried to shake off the theological influence of Origen was Marcellus of Ancyra, who did not succeed in producing any lasting effect on theology.

The attacks on Origen, which had begun in his lifetime, did not cease for centuries, and only subsided during the time of the fierce Arian controversy. It was not so much the relation between pistis and gnosis—faith and knowledge—as defined by Origen that gave offence, but rather isolated propositions, such as his doctrines of the pre-existence of souls, of the soul and body of Christ, of the resurrection of the flesh, of the final restoration, of the plurality of worlds. Even in the 3rd century Origen's view of the Trinity and of the Person of Christ was called in question, and it was from various points of view. It took not till the 5th century, however, that objections of this kind became frequent. In the 4th century Pamphilus, Eusebius of Caesarea, Athanasius, the Cappadocians, Didymus, and Rufinus were on the side of Origen against the attacks of Methodius and many others. But, when the zeal of Epiphanius was kindled against him, when Jerome, alarmed about his own reputation, and in defiance of his past attitude, turned against his once honoured teacher, and Theophilus, patriarch of Alexandria, found it prudent, for political reasons, and out of consideration for the uneducated monks, to condemn Origen—then his authority received a shock from which it never recovered. There were, doubtless, in the 5th century church historians and theologians who still spoke of him with reverence, but such men became fewer and fewer. In the West Vincent of Lerins held up Origen as a warning example (Commonit. 23), showing how even the most learned and most eminent of church teachers might become a misleading light. In the East the exegetical school of Antioch had an aversion to Origen; the Alexandrians had utterly repudiated him. Nevertheless his writings were much read, especially in Palestine. The monophysite monks appealed to his authority, but could not prevent Justinian and the fifth oecumenical council at Constantinople (553) from anathematizing his teaching. It is true that many scholars (e.g. Hefele, Concilien-

SOURCES AND LITERATURE.—Next to the works of Origen (see Redepenning, "Des Hieronymus wiederaufgefundenes Verzeichniss der Originalen und der in dem Orig.-Texte (1851) p. 85 sq.) the most important sources are: Gregory Thaumatus, Panegyricus in Origen; Eusebius, H.E. vi.; Epiphanius, Haer. 64; the works of Methodius, the Cappadocians, Jerome (see De vir. ill. 54, 61) and his letters (e.g. to a friend of his, his Epist. ad Mammam; (Mansi, ix. p. 476 sq.); Photius, Biblioth. 118, &c. There is no complete critical edition of Origen's works. The best edition is that of Car. and C. Vinc. Delarue (4 vols. fol.) 1831-48 and by Migne, Patrum. cens. compl. ser. Gr., vol. x. vii.; several new pieces have been edited by Gallandi and A. Mai. Amongst the older works on Origen those of Huetius (printed in Delarue, vol. iv.) are the best; but Tillemont, Fabricius, Walch (Historia d. Ketzereien, vii. pp. 362-706) and Schrock also deserve to be mentioned. In recent times the doctrine of Origen has been expounded in the great works on church history by Baur, Dörner, Hefele, Harnack, and Neander, "Geschichte der griechischen Kirche" and Kahn (Die Lehre vom h. Geist, vol. i.) with these the works on the history of philosophy by Ritter, Erdmann, Ueberweg and Zeller. Of monographs, the best and most complete is Redepenning's "Lehre von der menschlichen Lebens und seiner Lehre" (2 vols. 1841, 1846). Compare Thomasius, Orig. (1837); Krüger, "Über das Verhältniss des Orig. zu Ammonius Sakkus," in the Zschdr. f. hist. Theol. (1843), i. p. 46 sq.; Fischer, "Comment. de Orig. theolog. et cosmolog. (1846); Kamerer, Orig. Lehre von der Auferstehung des Fleisches (1851); Knittel, "Orig. Lehre von der Menschwerdung," in the Theol. Quartalschr. (1872); Schulte, "Christologie des Orig.," in the Journals f. protest. Theol. (1851); Meilhac, "Orig. nach Orig. in Zeitschr. f. Kirchengesch. vol. ii. (1878); Freppel, Origines, vol. i., 2d ed. (Paris, 1875). A full list of the later bibliography will be found in Harnack's Dogmengeschichte und Chronologie (A. H.A.).
ORIGINAI PACKAGE

its inspection laws,¹ and the basis of the law on the subject of "original package" was laid when, in 1827, Chief Justice Marshall interpreted these clauses in his decision of the case of Brown v. Maryland,¹ which tested the constitutionality of an act of the legislature of Maryland requiring a licence from importers of foreign goods by bale or package and from persons selling the same by wholesale, bale, package, hoghead, barrel or tierce. After pronouncing such a licence to be in effect a tax, the chief justice observed that so long as the thing imported remained the "property of the importer, in his warehouse, in the original form or package in which it was imported," a tax upon it was too plainly a duty on imports to escape the prohibition of the Constitution, that imported commodities did not become subject to the taxing power of the state until they had become incorporated and mixed with the mass of property in the country," that the right to sell a thing imported was incident to the right to import it, and consequently that a state tax upon the sale was repugnant to the power of Congress to regulate foreign commerce; and he added that the court supposed the same principles applied equally to interstate commerce. Later decisions agree that the right to import commodities or to ship them from one state to another carries with it the right to sell them and have established the boundary line between Federal and state control of both foreign imports and interstate shipments at a sale in the original package ² or at the breaking of the original package before sale for other purposes than inspection.³ A state or a municipality may, however, tax while in their original packages any commodities which have been shipped in from another state provided there be no discrimination against such commodities; this permission being granted on the theory that a general non-discriminating tax is not a regulation of commerce and therefore not repugnant to the power of Congress to regulate interstate commerce.¹ The first cases involving a serious conflict between the power of Congress to regulate interstate commerce and the police powers of the several states were the Licence Cases adjudicated by the Supreme Court of the United States in January 1847.⁴ They were to test the constitutionality of a law of Massachusetts requiring a licence for the sale of wines or spirituous liquors in a less quantity than 28 gallons, of a law of Rhode Island requiring a licence for the sale of such liquors in a less quantity than 10 gallons, and a law of New Hampshire requiring a licence for the sale of wines or spirituous liquors in any quantity whatever, and in this case a barrel of gin had been brought in Boston Mass., carried to Dover, N.H., and there sold in the same barrel. Although the justices based their opinions on different principles, the court pronounced the laws constitutional. The justices did not even agree that the power of Congress to regulate an interstate shipment included the power to authorize a sale after shipment, which is the basis of the original package doctrine as applied to interstate commerce, and Chief Justice Taney with two other justices who were of this opinion held that a state might nevertheless in the exercise of its police powers regulate such sales so long as Congress did not pass an act for that purpose. In this confused and uncertain state the matter rested until the adjudication of Leisy v. Hardin⁵ in 1889. In this case beer had been shipped from Illinois into Iowa and then sold in the original kegs and cases by an agent of the Illinois firm when Iowa had a law absolutely prohibiting the sale of intoxicating liquors within its limits except for pharmaceutical, medicinal, chemical or sacramental purposes. None of the justices now denied that the power of Congress to regulate an interstate shipment included the power to authorize a sale after shipment, and although there was disagreement with reference to the right of a state to regulate the sale in the absence of an act of Congress for that purpose, the majority of the court were of the opinion that: "Whenever a particular power of the general government is one which must necessarily be exercised by it, and Congress remains silent, this is not only not a concession that the powers reserved by the states may be exerted as if the specific power had not been elsewhere reposed, but, on the contrary, the only legitimate conclusion is that the general government intended that power should not be affirmatively exercised, and that the action of the states cannot be permitted to effect that which would be incompatible with such intention. Hence, inasmuch as interstate commerce, consisting in the transportation, purchase, sale and exchange of commodities, is national in its character and must be governed by a uniform system, so long as Congress does not pass any law to regulate it, or allowing the states so to do, it thereby indicates its will that such commerce shall be free and untrammeled." The opinion of Chief Justice Taney in Pierce v. New Hampshire was therefore in part overruled and the Iowa law in so far as it applied to the sale in the original packages of liquors shipped in from another state was pronounced unconstitutional. As a consequence of this decision, Congress, in 1890, passed the Wilson Act providing that all fermented, distilled, or other intoxicating liquors or liquids transported into any state or Territory for use, consumption, sale or storage therein should, even though in the original packages, be subject to the police laws of the state or Territory to the same extent as those produced within the state or Territory. Even with this act, however, a state is not permitted to interfere with an interstate shipment of liquor direct to the consumer.

What constitutes an original package was the principal question in Austin v. Tennessee ⁶ which was decided in November 1900. The general assembly of Tennessee had in this case made it a misdemeanour for any party to sell or to bring into the state for selling or giving away any cigarettes. The defendant had purchased at Durham, North Carolina, a quantity of cigarettes. They were packed in pasteboard boxes containing ten cigarettes each. The boxes were then placed in an open basket and in this manner the cigarettes were delivered at the defendant's place of business in Tennessee where he sold a package without breaking it. The court decided against the defendant because it held that the manner of transportation was evidently for the purpose of evading the state law and that the boxes were not original packages within the meaning of the Federal law, and in this connexion it observed that "The whole theory of the exemption of the original package from the operation of the state laws is based upon the idea that the property is imported in the ordinary form in which, from time to time immemorial, foreign goods have been brought into the country. These have gone at once into the hands of the wholesale dealers, who have been in the habit of breaking the package and distributing their contents among the several retail dealers throughout the state. It was with reference to the method of doing business that the doctrine of the exemption of the original package grew up." In the case of Schollenberger v. Pennsylvania, ⁷ however, the court decided that the state of Pennsylvania could not prohibit the sale of oleomargarine by retail when it had been shipped from Rhode Island in packages containing only 10 lb each, and the original package doctrine has been sharply criticized because of the difficulty in determining what constitutes an original package as well as because of the conflict between the doctrine and the police powers of the several states. It has been urged that the doctrine be abandoned and that commodities shipped into one state from another "be treated just like other goods already there are treated." ⁸

ORIHUELA, a town and episcopal see of eastern Spain, in the province of Alicante; 13 m. N.E. of Murcia and about 15 m. from the Mediterranean Sea, on the Murcia-Elche railway. Pop. (1900) 28,530. Orihuela is situated in a beautiful and exceedingly fertile huerta, or tract of highly cultivated land, at the foot of a limestone bridge, and on both sides of the river Segura, which divides the city into two parts, Roig and San Augusto, and is spanned by two bridges. There are remains of a Moorish fort on the hill commanding the town; and the north gateway—the Puerta del Colegio—is a fine lofty arch, surmounted by an emblematic statue and the city arms. The most prominent buildings are the episcopal palace (1733), with a frontage of 600 ft.; the town house (1843), containing important archives; and the cathedral, a small Gothic structure built on the site of a former mosque in the 14th century, and enlarged and tastefully restored in 1829. The university of Orihuela, founded in 1568 by the archbishop of Valencia, was closed in 1835, part of the revenue being applied to the support of a college affiliated to the university of Valencia. Besides numerous primary schools there are a theological seminary and a normal school. The town is rich in fruit, cereals, oil and wine is considerable. There are also factories for the manufacture of silk, linen and woolen fabrics, leather and starch.

Orihuela was captured by the Moors in 713, and retaken by James I. of Aragon, for his father-in-law Alphonso of Castile, in 1265. It was sacked during the disturbances at the beginning of the reign of Charles V. (1520), and again in the War of Succession (1706). Local annals especially mention the plague of 1648, the flood of 1651 and the earthquake of 1829.

ORILLIA, a town and port of entry of Simco county, Ontario, Canada, situated 84 m. N. of Toronto, on Lake Couchiching and on the Grand Trunk railway. Pop. (1901) 4007. It is a favourite summer resort, and has steamboat communication with other ports on Lakes Simco and Couchiching. It contains an asylum maintained by the provincial government; also saw and grist mills and iron foundries.

ORINOCO, a river in the north of South America, falling north-east into the Atlantic between 60° 20' and 63° 30' W. It is approximately 1500 m. long, but it is several hundred miles longer if measured by its Guaviare branch. Lying south and east of the main stream is a vast, densely forested region called Venezuelan Guiana, diversified by ranges of low mountains, irregular broken ridges and granitic masses, which define the courses of many unexplored tributaries of the Orinoco.

In 1498, Columbus, when exploring the Gulf of Paria, which receives a large part of the outflow of the Orinoco, noted the freshness of its waters, but made no examination of their origin. The caravels oj Ojeda which, in 1499, followed almost the same track as that of Columbus, probably passed in sight of one or more of the mouths of the Orinoco. The first to explore any portion of the mighty river was the reckless and daring adventurer Orad. In his expedition (1531-1532) he entered its principal outlet, the Boca de Navios, and, at the cost of many lives, ascended to the junction of the Meta with the parent stream. From Ordaz up to recent times the Orinoco has been the scene of many voyages of discovery, including those of El Dorado, and some scientific surveys have been made, especially among its upper waters, by José Solano and Diaz de la Fuente of the Spanish boundary commission of Yurriaga and Solano (1757-1763), Humboldt (1800) and Michelsen y Rojas (1855-1857). The last ascended to the Mawaca, a point about 170 m. above the northern entrance to the Casiquiare canal, and then a few miles up the Mawaca. A little knowledge about its sources above these points was given by the savages to de la Fuente in 1759 and to Mendoza in 1764, and it was also informed to Humboldt for some vague data.

At the date of the discovery, the Orinoco, like the Amazon, bore different names, according to those of the tribes occupying its margins. The conquistador Ordaz found that, at its mouth, it was called the Uriaparia, this being the name of the cacique of the tribe there. The Caribs, holding a certain section of the river, named it the Iribinoco, corrupted by the Spaniards into Orinoco. It was known to other tribes as the Barraguan and to others as the Maragua. The Cabres called it the Paragua, because it flowed such a vast area of country.

The principal affluent of the Orinoco from the Guiana district is the Orinoco, the head-waters of which are also unknown. It is an important stream, which, running some miles into the Orinoco about 90 m. above its Guaviare branch. Two other large tributaries of the Orinoco flow north from the interior of this mysterious Guiana district, the Rio Guaviare and the Caure and the Caroni. The former has recently been explored by Andre, who found great cascades and rapids; the latter is about 800 m. long, 400 of which are more or less navigable.

South of the Guaviare, as far as the divertorum aquarum, between it and the mouth of the Río Negro branch of the Orinoco, the river is only partially swept by moisture-laden winds, so that few streams of moment are found in its southern drainage basin; but north of it, as far as 6° 30' N., the north-east trade winds, which have escaped condensation in the hot lower valley of the Orinoco, beat against the cold eastern slopes of the lofty Colombian Andes, causing the river to lower down such vast volumes of water that the almost countless streams which flow across the plains of Colombia and western Amazonia are taxed beyond their capacity to reach it to the Orinoco, and for several months of the year they flood dig across their square miles of the districts they traverse. Among these the Apure, Arauca, Meta and Guaviare hold the first rank.

The Orinoco is the chief navigable river of the West Indies, the Guaviare and Sarare. The former, which rises in the Sierra de Marquez, which overlooks the Lake of Maracaibo, has 16 large affluents; the latter has its sources near the Colombian city of Calima, and they are only separated by the basin of the Magdalena by the "Oriental" Andean range. From the Urubanda, the first junction of the right bank of the Orinoco, the length of the Apure is 485 m., of which Codazzi makes the doubtful claim that 503 are navigable, for there are some troublesome rapids 114 m. above its mouth, where the Orinoco is 3 m. wide. The numerous affluents, which enter on the eastern and western and southern slopes of the Merida, Caraboso and Caracas mountain ranges. A few of them are navigable for a short distance; among these the most important is the many-armed Portuguese, on the island of Guayaquil, which flows from the north. A few of the large streams enter the lower Apure from the south, but they are frequently entangled in lateral canals, due to the slight elevation of the plains above sea-level, the waters of the Apure, especially during the rainy season, having opened a great number of esteros before reaching the Orinoco.

The "Oriental" Andes of Colombia give birth to another great affluent of the Orinoco, the Arauca, which soon reaches the plain and receives the Apure at its mouth. Perez says that the Sarare branch of the Apure has formed a gigantic delta of its own, composed of large quantities of sand, and that the waters of the Orinoco are carried into the Orinoco by the river, the former Sarare, having been joined by the Guaviare, from which the Sarare may be reached in small craft and land directly to the vicinity of Pamplona. The Arauca is navigable for large boats and barges up to the Andes, and by sail to its middle course. In the coastal region, unable to carry the additional water contributed by the Sarare, its banks swell by several canals which give it its outlet to the Cañanaparo, which, about 18 m. farther south, joins the Orinoco.

The Meta is known as such from the union of two Andean streams, the Uriaparo and the Iribinoco, which rise near Bogotá. At their junction, 700 ft. above sea-level, it is 1000 ft. wide and 7 ft. deep, in the dry season, but in flow the Meta rises 30 ft. It is navigable up to the mouth of the "Apostadero," about 150 m. above its mouth, but branches may ascend it, in the wet season, about 300 m. to the junction of the Negro with the Meta. In the dry season, however, it is obstructed by reefs, sandbanks, shallows, snags, trees and floating timber from the "Apostadero" up, so that even canoes find its ascent difficult, while sailing along its course there is much opportunity for danger.

The Guaviare is the next great western tributary of the Orinoco. Eugenio Alvarado, a Spanish commissioner for the boundary delimitation of Colombia with Brazil in 1759, informed the viceroy of the fact that the river Guaviare rises between Neiva and Popayan, and unite to take the name of Guaviare. In those times they called it Guaibari, or Guayuare. The Guaviare is about 500 m. long, of which 300 are called navigable, although not free from obstructions. Its upper portion has many sandbanks, shoals and falls. The river is infested by numerous alligators, so ferocious that they attack canoes. Two-thirds of the way up, it receives its Ariari tributary from the north-west, which is navigable for large boats. Near its mouth the Guaviare is divided into two branches, the Yuribar and the Yiridra. Above its rapid of Maripaní, 180 m. up, this stream runs swiftly through a rough country, but for a long distance it is a succession of shallow canals and shallow, overgrown areas. Its headwaters do not reach the Andes.

Between the Guaviare and the Meta the Orinoco is obstructed by the famous Mairipúres cataract, where, in several channels, it breaks through a granite spur of the Guiana highlands for a length of about
In Astronomy.—The constellation Orion is mentioned by Homer (II, xviii. 486, xxii. 20; Od. v. 274), and also in the Old Testament (Amos v. 8, Job ix. 5). The Hebrew name for Orion also means “fool,” in reference perhaps to a mythological story of a “foolhardy, heaven-daring rebel who was chained to the sky for his impertinence” (Driver). For the Assyrian names see Constellation. Ptolomey catalogued 38 stars, Tycho Brahe 42 and Hevelius 62. Orion is one of the most conspicuous constellations. It consists of three stars of the 1st magnitude, four of the 2nd, and many of inferior magnitude. α Orionis, or Betelgeuse, is a bright, yellowish-red star of varying magnitude (0-5 to 1-4, generally 0-9). β Orionis or Regal is a 1st magnitude star. γ Orionis or Bellatrix, and κ Orionis are stars of the 2nd magnitude. These four stars, in the order α, β, γ, κ, form an approximate rectangle. Three collarine stars, ε and δ Orionis constitute the “belt of Orion”; of these, ε, the central star, is of the 1st magnitude, δ, of the 2nd, while γ Orionis is a fine double star, its components having magnitudes 4-3 and 6; there is also a faint companion of magnitude 10. ρ Orionis, very close to ζ Orionis, is a very fine multiple star, described by Sir William Herschel as two sets of treble stars; more stars have been revealed by larger telescopes. θ Orionis is
a multiple star, situated in the famous nebula of Orion, one of the most beautiful in the heavens. (See Nebula.)

Orion and Orus, the names of several Greek grammarians, frequently confused. The following are the most important.

(1) Orion of Thebes in Egypt (5th century A.D.), the teacher of Proclus the neo-Platonist and of Eudocia, the wife of the younger Theodosius. He taught at Alexandria, Caesarea in Cappadocia and Byzantium. He was the author of a partly extant etymological Lexicon (ed. F. W. Sturz, 1820), largely used by the compilers of the Etymologicum Magnum, the Etymologicum Gudianum and other similar works; a collection of maxims in three books, addressed to Eudocia, also ascribed to him by Suidas, still exists in a Warsaw MS. (2) Orus of Miletus, who, according to Ritschl, flourished not later than the 2nd century A.D., and was a contemporary of Herodian and a little junior to Phrynichus (according to Reitzenstein he was a contemporary of Orion). His chief works were treatises on orthography; on Atticism, written in opposition to Phrynichus; on the names of nations.

See F. Ritschl, De Oro et Orione Commentatio (1834); R. Reitzenstein, Geschichte der griechischen Etymologiae (1867); and article "Orion" in Smith's Dictionary of Greek and Roman Biography.

Oriskany, a village of Oneida county, New York, U.S.A., about 7 m. N.W. of Utica. Pop. about 800. Oriskany is served by the New York Central & Hudson River railway. There are malleable iron works and a manufactory of paper makers' felts here. In a ravine, about 2 m. west of Oriskany, was fought on the 6th of August 1777 the battle of Oriskany, an important minor engagement of the American War of Independence. On the 4th of August Gen. Nicholas Herkimer, who had been colonel of the Oneida county (New York) militia in 1775, and had been made a brigadier-general of the state militia in 1776, had gathered about 800 militiamen at Fort Dayton (on the site of the present Herkimer, New York) for the relief of Fort Schuyler (see Rome, N.Y.) then besieged by British and Indians under Colonel Barry St Leger and Joseph Brant. On the 6th General Herkimer's force, on its march to Fort Schuyler, was ambushed by a force of British under Sir John Johnson and Indians under Joseph Brant in the ravine above mentioned. The rear portion of Herkimer's troops escaped from the trap, but were pursued by the Indians, and many of them were overtaken and killed. Between the remainder and the British and Indians there was a desperate hand-to-hand conflict, interrupted by a violent thunderstorm, with no quarter shown by either side. On hearing of this Fort Schuyler (incident to a sortie by Lt. Colonel Marinus Willett) the British withdrew, after about 200 Americans had been killed and as many more taken prisoners, the loss of the British in killed being about the same. General Herkimer (who had advised advancing slowly, awaiting signal shots announcing the sortie, and had been called "Tory" and "coward" in consequence), though his leg had been broken by a shot at the beginning of the action, continued to direct the fighting on the American side, but died on the 16th of August as a result of the clumsy amputation of his leg. The battle, though indecisive, had an important influence in preventing St Leger from effecting a junction with General Burgoyne. The battlefield is marked by a monument erected in 1854.

Orissa, a tract of India, in Bengal, consisting of a British division and twenty-four tributary states. The historical capital is Cuttack; and Puri, with its temple of Jagannath, is world-famous. Orissa differs from the rest of Bengal in being under a temporary settlement of land revenue. A new settlement for a term of thirty years was concluded in 1900, estimated to raise the total land revenue by more than one half; the greater part of this increase being levied gradually during the first eleven years of the term. To obviate destructive inundations and famines, the Orissa system of canals has been constructed, with a capital outlay of nearly two millions sterling. (See Mahanadi). The province is traversed by the East Coast railway, which was opened throughout from Cuttack to Madras in 1901.

The Division of Orissa consists of the five districts of Cuttack, Puri, Balasore, Sambalpur and the forfeited state of Angul. Total area 13,770 sq. m.; pop. (1901) 5,003,121, showing an increase of 7 per cent in the decade. According to the census of 1901 the total number of persons in all India speaking Oriya was more than 9,2 millions, showing that the linguistic area (extending into Madras and the Central Provinces) is much larger than the provincial area.

The whole of Orissa is holy ground. On the southern bank of the Baitarani shrine rises after shrine in honour of Siva, the All-Destroyer. On leaving the stream the pilgrim enters Jajpur, literally the city of sacrifice, the headquarters of the region of pilgrimage sacred to the wife of the All-Destroyer. There is not a fiscal division in Orissa without its community of cemelaties, scarcely a village without consecrated lands, and not a single ancient family that has not devoted its best acres to the gods. Every town is filled with temples, and every hamlet has its shrine. The national reverence of the Hindus for holy places has been for ages concentrated on Puri, sacred to Vishnu under his title of Jagannath, the Lord of the World. Besides its copious water-supply in time of high flood, Orissa has an average rainfall of 62½ in. per annum. Nevertheless, the uncontrolled state of the water-supply has subjected the country from time immemorial to droughts no less than to inundation. Thus the terrible famine of 1865-1866, which swept away one-fourth of the entire population, was followed in 1866 by a flood which destroyed crops to the value of £3,000,000. Since then much has been done by government to obviate the abundant water-supply.

The early history of the kingdom of Orissa (Odra-Desa), as recorded in the archives of the temple of Jagannath, is largely mythical. A blank in the records from about 50 B.C. to A.D. 319 corresponds to a period of Yavana occupation and Buddhist influence, during which the numerous rock monuments of Orissa were excavated. The founder of the Kesari or Lion dynasty, which ruled from A.D. 474 to 1132, is said to have restored the worship of Jagannath, and under this line the great Siva temple at Bhubaneswar was constructed. In 1132 a new line (the Gajapati dynasty) succeeded, and Vishnu took the place of Siva in the royal worship. This dynasty was extinguished in 1532-1534, and in 1578, after half a century of war, Orissa became a province of the Mogul empire. It nominally passed to the British in 1795, by the Diwani grant of Bengal, Bihar and Orissa, but at the time it was occupied by the Maharatta raja of Nagpur, from whom it was finally conquered in 1803.

The Tributary States of Orissa, known also as the Tributary Mahals, or the Garhjats, occupy the hills between the British districts and the Central Provinces. The most important are Mayurbhanj, Konarhaj, Dhenkanal, Bard and Nayagarh. In 1905 five Oriya-speaking states (Bamra, Rairakhol, Sonpur, Patna and Kalahandi) were added from the Central Provinces and two (Gangpur and Bona) from the Chota Nagpur states. This made the total area 28,046 sq. m. and the pop. (1901) 3,173,395.

Up to the year 1888 some doubt existed as to the actual position of the Tributary states of Orissa; but in that year the secretary of state accepted the view that they did not form part of British India, and modified powers were handed over to the Oriissa chiefs under the control of a superintendent.

See Sir W. W. Hunter, Orissa (1872).

Oristan, a town and archiepiscopal see of Sardinia, situated 23 ft. above sea-level, about 3 m. from the eastern shore of a gulf on the W. coast, to which it gives its name, and 59 m. N. by W. of Cagliari by rail. Pop. (1901) 7107. The town preserves some scanty remains of the walls (dating from the end of the 13th century), by which it was surrounded, and two gates, the Porta Manna, surmounted by a lofty square tower, known also as the Torre S. Cristoforo, and the Porta Marina. The houses are largely constructed of sun-dried bricks, and are low, so that the area of the town is considerable in proportion to its population.
ORIYA—ORKNEY, EARL OF

The cathedral was reconstructed in 1735 in the baroque style, and scanty traces of the original building of the 12th century exist (see D. Scano in L’Arte, 1901, p. 350; 1903, p. 175) and also in Storia dell’arte in Sardegna del XI. al XIV. secolo, Cagliari-Sassari, 1907). Some statuettes and sculptured slabs partly belonging to its pupil, perhaps the work of Andrea Pisano, have been found; upon the reverse side of two of the slabs are still older relics of the 8th or 9th century; so that the slabs perhaps originally came from Tharros. In the sanctuary is some fine silverwork. The church of S. Francesco also dates from the end of the 13th century, but has been altered. A fine statue by Nino, son of Andrea, is preserved here. Two m. south of Oristano is the village of S. Giusta, with a beautiful Romanesque church of the Pisan period dedicated to this saint (D. Scano, Bollettino dell’arte, Feb. 1907, p. 8), containing several antique columns. It was once an independent episcopal see. The lagoons on the coast are full of fish, but are a cause of malaria. The environs are fertile, and a quantity of garden produce is grown; while good wine (vernaccia) is also made, and also ordinary pottery in considerable quantities, supplying most of the island. The bridge crossing the river Tirso, a little to the north of the town, over 300 ft. long, with five arches, took the place, in 1876, of an old one which is said to have been of Roman origin. A m. south of the mouth of this river is the landing-place for shipping. The large orange groves of Milis lie 13 m. N. of Oristano at the base of Monte Ferru, where they are sheltered from the wind. The finest belong to the Marchese Boyl, whose plantation contains some 500,000 orange and lemon trees. The inhabitants of Milis manufacture reed baskets and mats, which they sell throughout Sardinia.

Oristano occupies the site of the Roman Orthoca, the point at which the inland road and the coast road from Catania to Turris Libisonis bifurcated, but otherwise an unimportant place, overshadowed by Tharros. The medieval town is said to have been founded in 1270. It was the seat from the 11th century onwards of the giudici (judges) of Arborea, one of the four divisions of the island. Almost the last of these judges was Eleonora (1347-1403); after her death Oristano became the seat of a marquisate, which was suppressed in 1478. The frontier castles of Monreale and Sanluri, some 20 and 30 m. respectively to the S.S.E., were the scene of much fighting between the Aragonese government and the giudici and marquises of Arborea in the 14th and 15th centuries. (T. As.)

ORIYA (properly Oriya), the Aryan language of Odāra or Orissa in India. It is the vernacular not only of that province but also of the adjoining districts and native states of Madras and of the Central Provinces. In 1901 it was spoken by 6,887,429 people. It is closely related to Bengali and Assamese, and with them and with Bihari it forms the Eastern Group of the Indo-Aryan vernaculars. See Bengali.

ORKHON INSCRIPTIONS, ancient Turkish inscriptions of the 8th century A.D., discovered near the river Orkhon to the south of Lake Baikal in 1889. They are written in an alphabet derived from an Aramaic source and recount the history of the northern branch of the Turks or Tu-kiue of Chinese historians. See Turks.

ORKNEY, EARL OF, a Scottish title held at different periods by various families, including its present possessors the Fitzmaurices. The Orkney Islands (q.v.) were ruled by jarls or earls under the supremacy of the kings of Norway from very early times to about 1360, many of these jarls being also earls of Caithness under the supremacy of the Scottish kings. Perhaps the most prominent of them were a certain Paul (d. 1099) who assisted the Norwegian king, Harald III, Haardrada, when he invaded England in 1066; and his grandson Paul the Silent, who, at least in part, the cathedral of St Magnus at Kirkwall. They were related to the royal families of Scotland and Norway. In its more modern sense the earldom dates from about 1380, and the first family to hold it was that of Sinclair, Sir Henry Sinclair (d. c. 1400) of Roslin, near Edinburgh, being recognized as earl by the king of Norway. Sir Henry was the son of Sir William Sinclair, who was killed by the Saracens whilst accompanying Sir James Douglas, the bearer of the Bruce’s heart, to Palestine in 1330, and on the maternal side was the grandson of Malise, who called himself earl of Strathearn, Caithness and Orkney. He ruled the islands almost like a king, and employed in his service the Venetian travellers Nicolo and Antonio Zeno. His son Henry (d. 1418) was admiral of Scotland and was taken prisoner by the English in 1406, together with Prince James, afterwards King James I.; his grandson William, the 3rd earl of Orkney, was also taken, and was sent to England to be kept in public affairs. In 1455 William was created earl of Caithness, and in 1470 he resigned his earldom of Orkney to James III. of Scotland, who had just acquired the sovereignty of these islands through his marriage with Margaret, daughter of Christian I., king of Denmark and Norway. In 1567 Queen Mary’s lover, James Hepburn, earl of Bothwell, was created duke of Orkney, and in 1581 her half-brother Robert Stewart (d. 1592), an illegitimate son of James V., was made earl of Orkney. Robert, who was abbot of Holyrood, joined the party of the reformers and was afterwards one of the principal enemies of the regent Morton. His son Patrick acted in a very arbitrary manner in the Orkneys, where he set the royal authority at defiance; in 1600 he was seized and imprisoned, and, after his bastard son Robert had suffered death for heading a rebellion, he himself was executed in February 1614, when his honours and estates were forfeited. In 1656 Lord George Hamilton was created earl of Orkney (see below). He married Elizabeth Villiers (see below), and he was succeeded by his daughter Anne (d. 1756), the wife of...
ORKNEY, COUNTESS OF–ORKNEY ISLANDS

William O’Brien, 4th earl of Inchiquin. Anne’s daughter Mary (c. 1721–1797) and her granddaughter Mary (1755–1831), were both countesses of Orkney in their own right; the younger Mary married Thomas Fitzmaurice (1742–1791), son of John Petty, earl of Shelburne, and was succeeded in the title by her grandson, Thomas John Hamilton Fitzmaurice (1801–1872), whose descendants still hold the earldom.

ORKNEY, ELIZABETH HAMILTON, Countess of (c. 1657–1733), mistress of the English King William III., daughter of Colonel Sir Edward Villiers of Richmond, was born about 1657. Her mother, Frances Howard, daughter of the 2nd earl of Suffolk, was governess to the Princesses Mary and Anne, and secured place and influence for her children in Mary’s household. Edward Villiers, afterwards created 1st Earl of Jersey (1656–1711), became Master of the Horse, while his sisters Anne and Elizabeth were among the maids of honour who accompanied Mary to the Hague on her marriage. Elizabeth Villiers became William’s acknowledged mistress in 1680. After his accession to the English crown he settled on her a large share of the confiscated Irish estates of James II. This grant was revoked by parliament, however, and the Earl of Jersey, of whom Mary’s marriage was fomented by Edward Villiers, and the bitter hostility between Elizabeth Villiers and the Duchess of Marlborough perhaps helped to secure the Duke’s disgrace with William. Shortly after Mary’s death, William, actuated, it is said, by his wife’s expressed wishes, broke with Elizabeth Villiers, who was married to her cousin, Lord George Hamilton, fifth son of the 3rd Duke of Hamilton, in November 1695. The husband was graced early in the next year with the titles of Earl of Orkney, Viscount of Kirkwall and Baron Deochmont. The Countess of Orkney served her husband’s interests with great skill, and the marriage proved a happy one. She died in London on the 19th of April 1733.

ORKNEY, GEORGE HAMILTON, Earl of (1666–1737), British soldier, was the fifth son of William, Duke of Hamilton, and was trained for the military career by his uncle, Lord Dumfriess, in the 1st Foot. In 1689 he became lieutenant-colonel and a few months later brevet colonel. He served at the battles of the Boyne and of Aughrim, and at the head of the Royal Fusiliers, at Steinkirk. As colonel of his old regiment, the 1st Foot, he took part in the battle of Landen or Neerwinden, and in the siege of Namur, serving also at Athlone and Limerick in the Irish war. At Namur Hamilton received a severe wound, and in recognition of his services was made a brigadier. In 1695 he married Elizabeth Villiers (see above), who was “the wisest woman” Swift “ever knew.” The following year he was made Earl of Orkney in the Scottish peerage. As a major general he took the field with Marlborough in Flanders, and on January 1st, 1703-1704 he became lieutenant-general. At Blenheim it was Orkney’s command which carried the village, and in June 1705 he led a flying column which marched from the Moselle to the rescue of Liege. At Ramillies he headed the pursuit of the defeated French, at Oudenarde he played a distinguished part, and in 1708 he captured the forts of St Amand and St Martin at Tourmau. At the desperately fought battle of Malplaquet Lord Orkney’s battalions led the assault on the French entrenchments, and suffered very severe losses. He remained with the army in Flanders till the end of the war, as “general of the foot,” and at the peace he was made colonel-commandant of the 1st Foot as a reward for his services. He occupied various civil and military posts of importance, culminating with the appointment of “field marshal of all His Majesty’s forces” in 1736. This appointment is the first instance of field marshal’s rank (as now understood) in the British Service. A year later he died in London.

ORKNEY ISLANDS, a group of islands, forming a county, off the north coast of Scotland. The islands are separated from the mainland by the Pentland Firth, which is 61 m. wide between Brough Ness in the island of South Ronaldshay and Duncansby Head in Caithness-shire. The group is commonly estimated to consist of 67 islands, of which 30 are inhabited (though in the case of four of them the population comprises only the light-
the methods of agriculture were of a primitive character, but since they have been entirely transformed, and Orkadian farming is now not below the average standard of the Scottish lowlands. The crofters’ houses have been rebuilt of stone and lime, and are superior to those in most parts of the Highlands. The holdings run fairly well, their nature lying between a sheep farm and a barley farm, and the only grain crops that are cultivated are oats (which greatly predominate) and barley, while the favoured root crops are turnips (much the most extensively grown) and potatoes. Not half of the area has been brought under cultivation; the acreage of cultivated ground is increased, and raising of live stock is rigorously pursued. Shorthorns and polled Angus are the commonest breeds of cattle; the sheep are mostly Cheviots and a Cheviot-Leicest crystal cross, but the native sheep are still reared in considerable numbers. South of the river Eden there is a desolate stretch of land, and the only inhabitants are herdsmen, however, has been organized, and of 2000 persons are employed in the various branches of it. The great catches are herring, cod and ling, but lobsters and crabs are also exported in large quantities. There is a regular communication by steamer between Stromness and Kirkwall, and there is a large fleet of fishing boats. The Orkneys are a self-governing county, and the district is situated in the parish of Caithness, and is a resident sheriff-substitute sits at Kirkwall. The county is under the school-board jurisdiction, but at Kirkwall and Stromness there are public schools, giving instruction in all the usual branches. The Orkneys—Preceding that they are more or less scattered, and that several lie on the same plane, the following begins the list of the inhabited islands from south to north, the number within brackets indicating the population. Sule Skerry (3) and the Pentland Skerries (2), and the Faeroes (24, 14 m. from the mainland, belong to Caithness and are situated in the parish of Caithness, and is the birthplace of William Irving, father of Washington Irving. It possesses several examples of Pictish and Scandinavian antiquities, such as the ‘Odin stone’ and the broch of Brokstone. Balfour Castle, a mansion in the Scottish Barony style built in 1728, is on the south-western extremity of the island. The island takes its name from Hjaldan, a Norse viking, Gairsay (33) is the residence of Swyne Aslefson, the rove, celebrated in the Orkneyinga Saga for his exploits as a treacherous and his feats in the Mongol wars. The island forms part of the Orkney archipelago, and is also largely under cultivation. At Lamb Head, its southern extremity, is a broch and Pictish pit, and about 2 m. farther north, on Odyn Bay, is a round pit in the rocks called the Vat of Cuthbert. The land is sparsely inhabited. The island has a population of 60. Egilsay (142) is the island on which St Magnus was murdered by his cousin Haco in 1115. It derives its name—Church (ectlesia)—from the little church of St Magnus, now reduced to a ruin, and about a mile of a chancel 15 ft. long, and nave 30 ft. long. The building has a round tower at the west end of the nave. The tower resembles similar constructions found beside Irish churches of the 7th and 8th centuries and has walls 3 ft. thick. It is doubtful whether it must be ascribed to the Celtic evangelist or the Saxons. On Rossay (627) the cairn of Bultoch Field (81 ft.), the highest point of the island, commands a beautiful view of the northern islands of the archipelago. At the southern base of the hill stands the fine mansion of Trumbland House, the seat of Sir Eddy Mowat. The island was off this hill that John Gow, the pirate, was taken in 1725. Sandy (1727), with an area of 19 sq. m., is one of the largest of the northern islands, and yields excellent crops of potatoes and potatoes. It has safe harbours in the north of the island. The island contains the broch of Elness. Phary (47) lies W. of Eddy, Westray (1956), one of the seas, the good harbour at Pier-o’-wall. Noltland Castle, in the vicinity, is interesting as having been the seat of the Tobermory family, and also of the Mar family. It stands on a high hill from Loch Leven. It dates from the 15th century or even earlier, and was at one time the property of Sir Gilbert Balfour, the Master of Queen Mary’s Household. The building, now in ruins, was never completed. On one side of the inner court, to which a finely ornamented door gives access, is a large chamber, with a vaulted ceiling of stone, 20 ft. high. The cliffs and overhanging crags at Noup Head (250 ft.), the most westwardly point, are remarkably picturesque. An isolated portion, divided from the headland by a narrow channel, is known as the Stack of Noup. Gentleman’s Cave, 1 m. to the south, was so called from the circumstance that it afforded shelter to five of the leading followers of Prince Charles Edward, who lay here during the winter of 1745-1746. Papa Westray (813) is the easternmost island, and forms part of the Northern Isles of the group. The latter is only reached from Sanday, from which it is separated by a dangerous firth 21 m. wide. The monumental stone with Ogham inscription, which was discovered in the broch of Burrian, must date from the days of the early Christian missionaries. History.—The Orkneys were the Orkades of classical writers, and the word is probably derived from the Norse Orakn, seal, and ey, island. The original inhabitants were Picts, evidence of whose occupation still exists in numerous weems or underground houses, chambered mounds, burrows or burial mounds, brochs or round towers, and stone circles and standing stones. Such implements as have suffered are of the rudest description, and include querns or stone handmills for grinding corn, stone words and bone combs employed in primitive forms of woolen manufacture, and specimens of simple pottery ware. If, as seems likely, the Dalriadic Scots towards the beginning of the 6th century established a footing in the islands, their success was short-lived, and the Picts regained power and kept it until dispossessed by the Norsemen in the 11th century. None of the Orkneys followed the Celtic missionaries about 500. They were companions of St Columba and their efforts to convert the folk to Christianity seem to have impressed the popular imagination, for several islands bear the epithet “Papa” in commemoration of the preachers. Norse pirates having made the islands the headquarters of their buccaneering expeditions indifferently against their own Norway and the coasts and islands of Scotland, Harold Haarfager (“Fair Hair”) subdued
the ravers in 875 and both the Orkneys and Shetlands to Norway. They remained under the rule of Norse ears until 1231, when the line of the jarls became extinct. In that year the earldom of Caithness was granted to Magnus, second son of the earl of Angus, whom the king of Norway apparently confirmed in the title. In 1468 the Orkneys and Shetlands were pledged by Christian I. of Denmark for the payment of the dowry of his daughter Margaret, betrothed to James III. of Scotland, and after the money was repaid, their connexion with the crown of Scotland has been perpetual. In 1471 James bestowed the castle and lands of Ravenscairn in Fife on William, earl of Orkney, in exchange for all his rights to the earldom of Orkney, which, by act of parliament passed on the 20th of February of the same year, was annexed to the Scottish crown. In 1504 Lord Robert Stewart, natural son of James V., who had visited Kirkwall twenty-four years before, was made sheriff of the Orkneys and Shetlands, and received possession of the estates of the udallers; in 1581 he was created earl of Orkney by James IV., the charter being ratified ten years later to his son Patrick, but in 1615 the earldom was again annexed to the crown. The islands were the rendezvous of Montrose's expedition in 1650 which culminated in his imprisonment and death. During the Protectorate they were visited by a detachment of Cromwell's troops, who initiated the inhabitants into various industrial arts and new methods of agriculture. In 1707 the islands were granted to Sir John Murray in mortgage, redeemable by the Crown on payment of £30,000, and subject to an annual feu-duty of £500; but in 1766 his estates were sold to Sir Lawrence Dundas, ancestor of the earls of Zetland. In early times both the archbishop of Hamburg and the archbishop of York disputed with the Norwegians ecclesiastical jurisdiction over the Orkneys and the right of consecrating bishops; but ultimately the Norwegian bishops, the first of whom was William the Old, consecrated in 1102, continued the canonical succession. The see remained vacant from 1580 to 1666, and from 1638 till the Restoration, and, after the accession of William III., the episcopacy was finally abolished (1697), although many of the clergy refused to conform. The topography of the Orkneys is wholly Norse, and the Norse tongue, at last extinguished by the constant influx of settlers from Scotland, lingered until the end of the 18th century. Readers of Scott's _Pirate_ will remember the frank contempt which Magnus Troll expressed for the Scots, and his opinions probably accurately reflected those of his contemporaries. When the islands were given as security for the princess's dowry, there seems reason to believe that it was intended to redeem the pledge, because it was then stipulated that the Norse system of government and the law of St Olaf should continue to be observed in Orkney and Shetland. Thus the _udal_ succession and mode of land tenure (or, that is, absolute freehold as distinguished from feudal tenure) still obtain to some extent, and the remaining _udallers_ hold their lands and pass them on without written title. Among well-known Orcadians may be mentioned James Atkine (1613-1687), bishop first of Moray and afterwards of Galloway; Murdoch McKenzie (d. 1797), the hydrographer; Malcolm Laing (1762-1818), author of the History of Scotland from the Union of the Crowns to the Union of the Kingdoms; Mary Brunton (1778-1818), author of Self-Control, Discipline and other novels; Samuel Laing (1785-1868), author of _A Residence in Norway_, and translator of _Heimskringla_, the Icelandic chronicle of the kings of Norway; Thomas Stewart Trail (1781-1862), professor of medical jurisprudence in Edinburgh University and editor of the 8th edition of the Encyclopædia Britannica; Samuel Laing (1812-1897), chairman of the London, Brighton & South Coast railway, and introducer of the system of "parliamentary" trains with fares of one penny a mile; Dr John Rae (1813-1863), the Arctic explorer; and William Balfour Baikie (1825-1894), the African traveller.

**ORLÉANNAIS**, one of the provinces into which France was divided before the Revolution. It was the country around Orleans, the _pagan Aurelianaensis_; it lay on both banks of the Loire, and for ecclesiastical purposes formed the diocese of Orleans. It was in the possession of the Capet family before the advent of Hugh Capet to the throne of France in 987, and in 1344 Philip VI. gave it with the title of duke to Philip (d. 1375), one of his younger sons. In a geographical sense the region around Orleans is sometimes known as Orleanais, but this is somewhat smaller than the former province.

See A. Thomas, _Les États provinciaux de la France centrale_ (1879).

**ORLEANISTS**, a French political party which arose out of the Revolution, and ceased to have a separate existence shortly after the establishment of the third republic in 1870. It took its name from the Orleans branch of the house of Bourbon, the descendants of the duke of Orleans, the younger brother of Louis XIV., who were its chiefs. The political aim of the Orleanists may be said to have been to find a common measure for the monarchical principle and the "rights of man" as set forth by the revolutionary leaders in 1789. The articles on Philippe, nicknamed Égalité (see _Orleans_, L.P.J., duke of), and _Orléanists_, R. (1839-1848), show the process of events by which it came to pass that the Orleans princes became the more or less successful advocates of this attempted compromise between old and new. It may be noted here, however, that a certain attitude of opposition, and of patronage of "freedom," was traditional in this branch of the house of Bourbon. Saint-Simon tells us that the regent Orleans who died in 1723 was in the habit of avowing his admiration for English liberty—at least in safe company and private conversation. Égalité, who had reasons to dislike King Louis XVI. and his queen, Marie Antoinette, stepped naturally into the position of spokesman of the liberal royalists of the early revolutionary time, and it was a short step from that position to the attitude of liberal candidates for the throne, as against the elder branch of the royal house which claimed to reign by divine right. The elder branch as represented by Louis XVIII. was prepared to grant (octroyer), and did grant, a charter of liberties. The cordon of the Chamber, the last of the line (the Spanish Bourbons who descended directly from Philip II. of France were considered to be barred by the renunciation of Philip V. of Spain), was equally ready to grant a constitution. But these princes claimed to rule "in chief of God" and to confer constitutional rights on their subjects of their own free will, and mere motion. This feudal language and these mystic pretensions offended a people so devoted to principles as the French, and so acute in drawing deductions from premises, for they concluded, not unreasonably, that rights granted as a favour were always subject to revocation as a punishment. Therefore those of them who considered a monarchical government as more beneficial to France than a republic, but who were not disposed to hold their freedom subject to the pleasure of a king, were either Bonapartists who professed to rule by the choice of the nation, or supporters of the Orleans princes who were ready to reign by an "original compact" and by the will of the people. The difference therefore between the supporters of the elder line, or Legitimists, and the Orleanists was profound, for it went down to the very foundations of government.

The first generation of Orleanists, the immediate supporters of Philippe Égalité, were swamped in the turmoil of the great revolution. Yet it has been justly pointed out by Albert Sorel in his _L'Europe et la revolution francaise_, that they subsisted under the Empire, and that they came naturally to the front when the revival of liberalism overthrew the restored legitimate monarchy of Louis XVIII. and Charles X. During the Restoration, 1815-1830, everything tended to identify the liberals with the Orleanists. Legitimism was incompatible with constitutional freedom. Bonapartism was in eclipse, and was moreover essentially a Caesarism which in the hands of the great Napoleon
had been a despotism, calling itself democratic for no better reason than because it reduced all men to an equality of submission to a master. Those rights of equality before the law, and in social life, which had been far dearer to Frenchmen of the revolutionary epoch than political freedom, were secured.

The next step was to obtain political freedom, and it was made under the guidance of men who were Orleanists because the Orleans princes seemed to them to offer the best guarantee for such a government as they desired—a government which did not profess to stand above the people and to own it by virtue of a divine and legitimate hereditary right, nor one which, like the Bonapartists, implied a master relying on an army, and the general subjection of the nation. The liberals who were Orleanists had the advantage of being very ably led by men eminent in letters and in practical affairs—Guizot, Thiers, the Broglies, the banker Lafayette and many others. When the unsurpassed folly of the legitimate rulers brought about the revolution of 1830, the Orleanists stepped into its place, and they marked the profound change which had been made in the character of the government by calling the king "King of the French" and not "King of France and Navarre." He was chief of the people by compact with the people, and not a territorial lord holding, in feudal phrase, "in chief of God."

The events of the eighteen years of Orleanist rule cannot be detailed here. They were on the whole profitable to France. That they ended in another "general overturn" in 1848 was due in part to errors of conduct in individual princes and politicians, but mainly to the fact that the Orleanist conception of what was meant by the word "people" led them to offend the long-standing and deeply-rooted love of the French for equality. It had been inevitable that the Orleanists, in their dislike of "divine right" on the one hand, and their fear of democratic Caesarism on the other, should turn for examples of a free government to England, and in England itself to the Whigs, both the old Whigs of the Revolution Settlement of 1689, and the new Whigs who extended political franchises for the middle classes by the Reform Bill. They saw there a monarchy based on a parliamentary title, governing constitutionally and supported by the middle classes, and they endeavoured to establish the like in France under the name of a juste-milieu, a via media between absolutism by divine right, and a democracy which they were convinced would lead to Caesarism. The French equivalent for the English middle-class constituencies was to be a pays légal of about a quarter of a million of voters by whom all the rest of the country was to be governed. "Nothing was more expressed.

The doctrine was expounded and was acted upon by Guizot with uncompromising rigour. The Orleanist monarchy became so thoroughly middle-class that the nation outside of the pays légal ended by thinking that it was being governed by a privileged class less offensive, but also a great deal less brilliant, than the aristocracy of the old monarchy.

The revolution of 1848 swept the Orleanist party from power for ever. The Orleanists indeed continued throughout the Second Republic and the Empire (1848-1870) to enjoy a marked social and literary prestige, on the strength of the wealth and capacity of some of their members, their influence in the French Academy and the ability of their organs in the press—particularly the Revue des deux mondes, the Journal des débats, and the papers directed by E. Hervé. During the Empire the discreet opposition of the Orleanists, exercised for the most part with infinite dexterity and tact, by reticences, omissions, and historical studies in which the Empire was attacked under foreign names, was a real protection of the dynasty and the house of Napoleon III. Yet they possessed little hold on the country and outside of a cultivated liberal circle in Paris. Their weakness was demonstrated when the second empire was swept away by the German War of 1870-71. The country in its disgust at the Bonapartists and its fear of the Republicans, chose a great many royalists to represent it in the Assembly which met in Bordeaux on the 12th of February 1872. In this body the Orleanists again exercised a kind of leadership by virtue of individual capacity, but they were counterbalanced by the Legitimists. The most effective proof of power they gave was to render possible the expulsion from power of Thiers on the 24th of May 1873, as punishment for his dexterous imposition of the Republic on the unwilling majority of the Assembly. Their real occupation was to endeavour to bring about a fusion between themselves and the Legitimists which should unite the two royalist parties for the confusion of the Bonapartists and Republicans. The belief that a fusion would strengthen the royalists was natural and was not new. As far back as 1850 Guizot had proposed, or had thought of proposing, one, but it was on the condition that the comte de Chambord would resign his divine pretensions. When a fusion was arranged in 1873 it was on quite another footing. After much exchange of notes and many agitated conferences in committee rooms and drawing-rooms, the comte de Paris, the representative of the Orleanists, sought an interview with the comte de Chambord at Frohsdorf, and obtained it by giving a written engagement that he came not only to pay his respects to the head of his house, but also to "accept his principle." It has been somewhat artlessly pleaded by the Orleanists that this engagement was given with mental reservations. But there were no mental reservations on the part of the comte de Chambord, and the country showed its belief that the liberal royalists had been fused by absorption in the divine right royalists. It returned republicans at by-elections till it transformed the Assembly. The Orleanist princes had still a part to play, more particularly after the death of the comte de Chambord in 1883, for in the heads of the house of France, but the Orleanist party ceased to exist as an independent political organization.

AUTHORITIES.—The Orleanists are necessarily more or less dealt with in all histories of France since 1789, and in most political memoirs, but their principles can be learnt and their fortunes followed from the following: A. Sorel, L'Europe et la révolution française (Paris, 1885-1904); F. Guizot, Histoire parlementaire de la France (Paris, 1819-1848); M. Pitou, Mémoires pour servir à l'histoire de mon temps (Paris, 1858-1867); P. de la Gorce, Histoire du second empire (Paris, 1894-1904); and G. Hanotaux, Histoire de la France contemporaine (Paris, 1903, &c.).

ORLEANS, DUKES OF.—The title of duke of Orleans was first created by King Philip VI in favour of his son Philip, who died without legitimate issue in 1375. The second duke of Orleans, created in 1392, was Louis, a younger son of Charles V. His heir was his son, the poet Charles d'Orleans. Charles's son, Louis, the successor of his father, became king of France in 1389 as Louis XII in 1498, when the duchy of Orleans was united with the royal domain. In 1626 Louis XIII created his brother, Jean Baptiste Gaston, duke of Orleans, and having become extinct on the death of this prince in 1660 the title was revived in the following year by Louis XIV, in favour of his brother Philip. Descendants of this duchy have retained the title until the present day, one of them becoming king of France as Louis Philippe in 1830. Two distinguished families are descended from the first house of Orleans: the counts of Angoulême, who were descended from John, a son of Duke Louis I, and who furnished France with a king in the person of Francis I; and the counts and dukes of Longueville, whose founder was John, count of Dunois, the bastard of Orleans, a natural son of the same duke. In addition to the dukes of Orleans the most important members of this family are: Anne Marie Louise, duchess of Montpensier; Francis, prince of Joinville; Louis Philippe Albert, count of Paris; and the traveller Prince Henry of Orleans. See the genealogical table to the article Bourbons.

See below for separate articles on the chief personages.

ORLEANS, CHARLES, DUKE OF (1391-1465).—Commonly called Charles d'Orléans. French poet. He was the eldest son of Louis, duke of Orleans (brother of Charles VI of France), and of Valentina Visconti, daughter of Giau Galeazzo, duke of Milan. He was born on the 26th of May 1391. Although many minor details are preserved of his youth, nothing except his reception in 1403, from his uncle the king, of a pension of 12,000 livres d'or is worth noticing, until his marriage three years later (June 29, 1406) with Isabella, his cousin, widow of Richard II. of England. The bride was two years older than her husband, and is thought to have married him unwillingly.
but she brought him a great dowry—it is said, 500,000 francs. She died three years later, leaving Charles at the age of eighteen a widower and father of a daughter. He was already duke of Orleans, for Louis had been assassinated by the Burgundians two years before (1407). He soon saw himself the most important person in France, except the dukes of Burgundy and Brittany, the king being a cipher. This position his natural temperament by no means qualified him to fill. His mother desired vengeance for her husband, and Charles did his best to carry out her wishes by filling France with intestine war. Of this, however, he was only nominally one of the leaders, the real guidance of his party resting with Bernard VII., the great count of Armagnac, whose daughter, Bonne, he married, or at least formally espoused, in 1410. Five years of confused negotiations, plots and fightings passed before the English invasion and the battle of Agincourt, where Charles was joint commander-in-chief. According to one account he was dangerously wounded and narrowly escaped with his life. He was certainly taken prisoner and carried to England, which country was his residence henceforward for a full quarter of a century. Windsor, Pontefract, Amphill, Wingfield (Suffolk) and the Tower are named among other places the scenes of his captivity, which whatever else it was, was not a rigorous one. He was maintained in the state due not merely to one of the greatest nobles of France but to one who ranked high in the order of succession to the crown. He hunted and hawked and enjoyed society amply, though the very dignities which secured him these privileges made his ransom great, and his release difficult to arrange. Above all, he had leisure to devote himself to literary work. But for this he would hardly be more than a name.

This work consists wholly of short poems in the peculiar artificial metres which had become fashionable in France about half a century or more before his birth, and which continued to be fashionable till nearly a century after his death. Besides these a number of English poe is have been attributed to him, but without certainty. They have not much poetical merit, but they exhibit something of the smoothness of versification not uncommon in those who write, with care, a language not their own. The ingenuity of a single English critic has strained to attribute to him a curious book in prose, called Le Débat des hérauts de France et d'Angleterre, but Paul Meyer, in his edition of the book in question, has completely disposed of this theory. For all practical purposes, therefore, Charles's work consists of some hundreds of short French poems, a few in various metres, but the majority either ballades or rondeaux. The chronology of these poems is not always clear, still less the identity of the persons to whom they are addressed, and it is certain that some, perhaps the greater part of them, belong to the later years of the poet's life. But many are expressly stated in the manuscripts to have been "composed in prison," others are obviously so composed, and, on the whole, there is in them a remarkable unity of literary flavour. Charles d'Orléans is not distinguished by any extraordinary strength of passion or originality of character; but he is only the more valuable as the last and not the least accomplished representative of the poetry of the middle of the middle ages, in which the form was almost everything, and the personality of the poet, save in rare instances, nothing. Yet he is a poet much worthier of mention—\textit{differens}. He is a captious example of the cultivated and refined, may almost be called the lettered—chivalry of the last chivalrous age, expert to the utmost degree in carrying out the traditional details of a graceful convention in love and literature. But he is more than this; in a certain easy grace and truth of expression, as well as in a peculiar mixture of melancholy, which is not incompatible with the enjoyment of the pleasures, even the trifling pleasures, of life, with listlessness that is fully able to occupy itself about those trifles, he stands quite alone. He has the urbanity of the 18th century without its vicious and prosaic frivolity, the poetry of the middle ages without their tendency to tediousness. His best-known rondeaus—those on Spring, on the Harbingers of Summer, and others—rank second to nothing of their kind.

Poetry, however, could hardly be an entire consolation, and Charles was perpetually scheming for liberty. But the English government had too many reasons for keeping him, and it was not till his hereditary foe Philip the Good of Burgundy interested himself in him that the government of Henry VI., which had by that time lost most of its hold on France, released him in return for an immediate payment of 80,000 saluts d'or, and an engagement on his part to pay 140,000 crowns at a future time. The agreement was concluded on the 2nd of July, 1440. He was actually released on the 3rd of November following, and almost immediately cemented his friendship with Duke Philip by marrying his niece, Mary of Cleves, who brought him a considerable dowry to assist the payment of his ransom. He had, however, some difficulty in making up the balance, as well as the large sum required for his brother, Jean d'Angoulême, who also was an English prisoner. The last twenty-five years of his life (for, curiously enough, it divides itself into three almost exactly equal periods, each of that length) were spent partly in negotiating, with a little fighting intermixed, for the purpose of gaining the Italian country of Asti, on which he had claims through his mother, partly in travelling about, but chiefly at his principal seat of Blois. Here he kept a miniature court which, from the literary point of view, was by no means devoid of brilliancy. At this most of the best-known French men-of-letters at the time—Villon, Olivier de la Marche, Chastelain, Jean Meschino and others—were residents or visitors or correspondents. His son, afterwards Louis XII., was not born till 1462, three years before Charles's own death. He had become, notwithstanding his high position, something of a nullity in politics, and tradition ascribes his death to vexation at the harshness with which Louis XI. rejected his attempt to mediate on behalf of the duke of Brittany. At any rate he died, on the 4th of January, 1465, at Amboise. Many of his later poems are small occasional pieces addressed to his courtiers and companions, and in not a few cases answers to them by those to whom they were addressed.

The best edition of Charles d'Orléans's poems, with a brief but sufficient account of his life, is that of C. d'Héricault in the \textit{Noweelle collection Jackson Paris} of the English poems sees the edition by Watson Taylor for the Roxburghe Club (1827). (G. S.)

\textbf{ORLEANS, FERDINAND PHILIP LOUIS CHARLES HENRY, DUKE OF (1819—1842), born at Palermo on the 3rd of September 1819, was the son of Louis Philippe, duke of Orleans, afterwards king of France, and Marie Amélie, princess of the Two Sicilies. Under the Restoration he bore the title of duke of Chartres, and studied classics in Paris at the Collège Henri IV. At the outbreak of the Revolution, which in 1830 set his father on the throne, he was colonel of a regiment of Hussars. He then assumed the title of duke of Orleans, and was sent by the king to Lyons to put down the formidable riots which had broken out there (1831), and then to the siege of Antwerp (1832). He was appointed lieutenant-general, and made several campaigns in Algeria (1835, 1839, 1840). On his return to France he organized the battalions of light infantry known as the \textit{chasseurs d'Orléans}. He died as the result of a carriage accident at Neuilly, near Paris, on the 13th of July 1842.

The duke of Orleans had married (May 30, 1837) Hélène Louise Elisabeth of Mecklenburg-Schwerin, and had by her two sons, the count of Paris and the duke of Chartres. On the 24th of February 1848, after the abdication of Louis Philippe, the duke of Orleans went to the Château of St. Cloud—assumed in the Palais Bourbon in the hope of having her eldest son proclaimed and of obtaining the regency; but the threatening attitude of the populace forced her to flee. She took refuge in England, and died at Richmond on the 18th of May 1858. (M. P.)*

\textbf{ORLEANS, HENRI, PRINCE OF (1867—1901), eldest son of Robert, duke of Chartres, was born at Ham, near Richmond, Surrey, on the 16th of October 1867. In 1889, at the instance of his father, who paid the expenses of the tour, he undertook, in company with M. Bonvalot and Dedeken, a journey through Siberia to Siam. In the course of their travels they crossed the}
ORLEANS, DUCHESS OF

ORLEANS, DUKE OF

mountain range of Tibet, and the fruits of their observations, submitted to the Geographical Society of Paris (and later incorporated in *De Paris au Tonkin & travers le Téïnon inconnue*, published in 1862), brought them jointly the gold medal of that society. In 1892 the prince made a short journey of exploration in East Africa, and shortly afterwards visited Madagascar, proceeding thence to Tongking. From this point he set out for Assam, and was successful in discovering the sources of the river Irrawaddy, a brilliant geographical achievement which secured the medal of the Geographical Society of Paris and the cross of the Legion of Honour. In 1897 he revisited Abyssinia, and political differences arising from this trip led to a duel with the comte de Turin, in which both combatants were wounded. While on a trip to Assam in 1901 he died at Saigon on the 9th of August. Prince Henri was a somewhat violent Anglophobe, and his diatribes against Great Britain contrasted rather curiously with the cordial reception which his position as a traveller obtained for him in London, where he was given the gold medal of the Royal Geographical Society.

ORLEANS, HENRIETTA, DUCHESS OF (1644–1670), third daughter of the English king, Charles I., and his queen, Henrietta Maria, was born during the Civil War at Exeter on the 16th of June 1644. A few days after her birth her mother left England, and she was brought up in France. Charles she lived at Exeter under the care of Lady Dalkeith (afterwards countess of Morton) until the surrender of the city to the parliamentarians, when she was taken to Oatlands in Surrey. Then in July 1662 Lady Dalkeith carried the princess in disguise to France, and she rejoined her mother in Paris, where her girlhood was spent and where she was educated as a Roman Catholic. Henrietta was present at the coronation of Louis XIV., and was mentioned as a possible bride for the king, but she was betrothed, not to Louis, but to his only brother Philip. After the restoration of her brother Charles II., she returned to England with her mother, but a few months later she was again in Paris, where she was married to Philip, now duke of Orleans, on the 30th of March 1661. The duchess was very popular at the court of Louis XIV., and was on good terms with the grand monarch himself; she shared in the knowledge of state secrets, but was soon estranged from her husband, and at the best her conduct was very improvident. In 1670, at the instigation of Louis, she visited England and obtained the signature of Charles II.'s ministers to the treaty of Dover. Her success in this matter greatly delighted Louis, but it did not improve her husband's relations with Philip, who had long refused his consent to his wife's visit to England. Shortly after returning to France, Henrietta died at St Cloud on the 30th of June 1670. She was buried at St Denis, her funeral oration being pronounced by her friend Bossuet, and it was asserted that she had been poisoned by order of her husband. She left two daughters, Marie Louise, wife of Charles II. of Spain, and Anne Marie, wife of Victor Amadeus II. of Savoy. According to legitimist principles, the descendants of Henrietta, through her daughter Marie of Savoy, are entitled to wear the British crown.

ORLEANS, JEAN BAPTISTE GASTON, DUKE OF (1608–1666), third son of the French king Henry IV., and his wife Marie de Medicis, was born at Fontainebleau on the 25th of April 1608. Known at first as the duke of Anjou, he was created duke of Orleans in 1626, and was nominally in command of the army which besieged La Rochelle in 1628, having already entered upon that course of political intrigue which was destined to occupy the remainder of his life. On two occasions he was obliged to leave France for conspiring against the government of his elder brother and Cardinal Richelieu; and after waging an unsuccessful war in Languedoc, he took refuge in Flanders. Reconciled with his brother Louis XIII., he plotted against Richelieu in 1635, fled from the country, and then deserted to the king and the cardinal. Soon afterwards the same process was repeated. Orleans stirred up Cinq-Mars to attempt Richelieu's murder, and then deserted his unfortunate accomplice. In 1643, on the death of Louis XIII., Gaston became lieutenant-general of the kingdom, and fought against Spain on the northern frontiers of France; but during the wars of the Fronde he passed with great facility from one party to the other. Then exiled by Mazarin to Blois in 1652 he remained there until his death on the 29th of February 1666. Gaston's first wife was Marie (d. 1627), daughter and heiress of Henri de Bourbon, duke de Montpensier (d. 1668), and his second wife was Marguerite (d. 1672), sister of Charles III., duke of Lorraine. By Marie he left a daughter, Anne Marie, duchesse de Montpensier (q.v.); and by Marguerite he left three daughters, Marguerite Louise (1645–1721), wife of Cosimo III., grand duke of Tuscany; Elizabeth (1646–1666), wife of Louis Joseph, duke of Guise; and Françoise Madeleine (1648–1664), wife of Emmanuel II., duke of Savoy. (M. P. *)

ORLEANS, LOUIS, DUKE OF (1372–1407), younger son of the French king, Charles V., was born on the 13th of March 1372. Having been made count of Vassois and of Beumont-sur-Oise, and then duke of Touraine, he received the duchy of Orleans from his brother Charles VI. in 1392, three years after his marriage with Valentina (d. 1408), daughter of Gian Galeazzo Visconti, duke of Milan. This lady brought the county of Asti to her husband; but more important was her claim upon Milan, which she transmitted to her descendants, and which furnished Louis XII. and Francis I. with a pretext for interference in northern Italy. When Charles VI. became insane in 1392, Orleans placed himself in opposition to his uncle Philip II., duke of Burgundy, who had conducted the king's affair; and this quarrel was not only the dominating factor in the affairs of France, but extended beyond the borders of that country. Continued after Philip's death in 1404 with his son and successor, John the Fearless, it culminated in the murder of Orleans by one of John's partisans on the 23rd of November 1407. The duke, who was an accomplished and generous prince, was suspected of immoral relations with several ladies of the royal house, among them Isabella of Bavaria, the queen of Charles VI. He had eight children by Valentina Visconti, including his successor, Charles of Orleans, the poet, and one of his natural sons was the famous bastard of Orleans, John, count of Dunois.

ORLEANS, LOUIS, DUKE OF (1703–1752), only son of Duke Philip II., the regent Orleans, was born at Versailles on the 4th of August 1703. A pious, charitable and cultured prince, he took very little part in the politics of the time, although he was conspicuous for his hostility to Cardinal Dubois in 1723. In 1730 Cardinal Fleury secured his dismissal from the position of colonel-general of the infantry, a post which he had held for nine years, and reduced him to a pension of 45,000 livres. He spent the time he gained mainly in translating the Psalms and the epistles of St Paul. Having succeeded his father as duke of Orleans in 1723, he died in the abbey of St Geneviève at Paris on the 4th of February 1752. His wife Augusta (d. 1726), daughter of Louis William, margrave of Baden, bore him an only son, Louis Philippe, who succeeded his father as duke of Orleans.

ORLEANS, LOUIS PHILIPPE, DUKE of (1725–1785), son of Louis, duke of Orleans, was born at Versailles on the 12th of May 1725, and was known as the duke of Chartres until his father's death in 1752. Serving with the French armies he distinguished himself in the campaigns of 1742, 1743 and 1744, and at the battle of Fontenoy in 1745, retiring to Bagnolet in 1757, and occupying his time with theatrical performances and the society of men of letters. He died at St Assise on the 18th of November 1785. The duke married Louise Henriette de Bourbon-Conti, who bore him a son Philip (Égalité), duke of Orleans, and a daughter, who married the last duke of Bourbon. His second wife, Madame de Montesson, whom he married secretly in 1770, was a clever woman and an author of some repute. He had two natural sons, known as the abbots of St Far and the abbot of St Albin.

See *L'Autome d'un prince*, a collection of letters from the duke to his second wife, edited by J. Hermand (1910).

ORLEANS, LOUIS PHILIPPE JOSEPH, DUKE of (1747–1793), called PHILIPPE ÉGALITÉ, son of Louis Philippe, duke of Orleans, and of Louise Henriette of Bourbon-Conti, was born at St Cloud
ORLEANS, DUKES OF

on the 13th of April 1747. Having borne the title of duke of Montpensier until his grandfather's death in 1759, he became duke of Chartres, and in 1769 married Louise Marie Adélaïde de Bourbon-Penthièvre, and daughter and heiress of the duke of Penthièvre, grand admiral of France, and the richest heiress of the time. Her wealth made it certain that he would be the richest man in France, and he determined to play a part equal to that of his great-grandfather, the regent, whom he resembled in character and debauchery. As duke of Chartres he opposed the plans of Maupou of 1771, and was promptly exiled to his country estate of Villers-Cotterets (Aisne). When Louis XVI. came to the throne in 1774 Chartres still found himself looked on coldly at court; Marie Antoinette hated him, and envied him for his wealth, wit and freedom from etiquette, and he was not slow to return her hatred with scorn. In 1778 he served in the squadron of D'Orvilliers, and was present in the naval battle of Ushant on the 27th of July 1778. He hoped to see further service, but the queen was opposed to this, and he was removed from the navy, and given the honorary post of colonel-general of hussars. He then abandoned himself to pleasure; he visited London, and became an intimate friend of the prince of Wales (afterwards George IV.); he brought to Paris the "anglo-mania," as it was called, and made jockeys as fashionable as they were in England. He also made himself very popular in Paris by his large gifts to the poor in time of famine, and by throwing open the gardens of the Palais Royal to the people. Before the meeting of the notables in 1787 he had succeeded his father as duke of Orleans, and showed his liberal ideas, which were largely learnt in England, so boldly that he was believed to be aiming at becoming constitutional King of France. In November he again showed his liberalism in the Période jeunesse, in which Brienne had made the king hold, and was again exiled to Villers-Cotterets. The approaching convocation of the states-general made his friends very active on his behalf; he circulated in every baillage the pamphlets which F. J. Sieyès had drawn up at his request, and was elected in three—by the noblesse of Paris, Villers-Cotterets and Crépy-en-Valois. In the estate of the nobility he headed the liberal minority under the guidance of Adrien Duport, and led the minority of forty-seven noblemen who seceded from their own estate (June 1789) and joined the Tiers État. The part he played during the summer of 1789 is one of the most debated points in the history of the Revolution. The court accused him of being at the bottom of every popular movement, and said he was "the gold of Orleans" as the cause of the Revellion riot and the taking of the Bastille, as the republicans later said the "gold of Pitt," and got all the blame for themselves. There can be no doubt that he hated the king, and bitterly resented his long disgrace at court, and also that he sincerely wished for a thorough reform of the government and the establishment of some such constitution as that of England; and no doubt such friends as Adrien Duport and Choderlos de Laclos, for their own reasons, wished to see him king of France. The best testimony for the behaviour of Orleans during this summer is the testimony of an English lady, Mrs Grace Dalrymple Elliott, who shared his heart with the comtesse de Buffon, and from which it is absolutely certain that at the time of the riot of the 12th of July he was on a fishing excursion, and was rudely treated by the king on the next day when going to offer him his services. He indeed became so disgusted with the false position of a pretender to the crown, into which he was being forced, that he wished to go to America, but, as the comtesse de Buffon would not go with him, he decided to remain in Paris. He was again accused, unjustly, of having caused the march of the women to Versailles on the 5th of October. La Fayette, jealous of his popularity, persuaded the king to send the duke to England on a mission, and thus get him out of France, and he accordingly remained in England from October 1789 to July 1790. On the 7th of July he took his seat in the Assembly, and on the 2nd of October both he and Mirabeau were declared by the Assembly entirely free of any complicity in the events of October. He now tried to keep himself as much out of the political world as possible, but in vain, for the court would suspect him, and his friends would talk about his being king. The best proof of his not being ambitious of such a doubtful piece of preferment is that he made no attempt to get himself made king, regent or lieutenant-general of the kingdom at the time of the flight to Varennes in June 1791. He, on the contrary, again tried to make his peace with the court in January 1792, but he was so insulted that he was not encouraged to sacrifice himself for the sake of the king and queen, who persisted in remembering all old enmities in their time of trouble. In the summer of 1792 he was present for a short time with the army of the north, with his two sons, the duke of Chartres and the duke of Montpensier, but had returned to Paris before the 10th of August. After that day he underwent great personal risk in saving fugitives; in particular, he saved the life of the count of Champcenetz, the governor of the Tuileries, who was his personal enemy, at the request of Mrs Elliott. It was impossible for him to recede, and, after accepting the title of Citoyen Égalité, conferred on him by the commune of Paris, he was elected twentieth and last deputy for Paris to the Convention. In that body he sat as quietly as he had done in the National Assembly, but on the occasion of the king's trial he had to speak, and then only to give his vote for the death of Louis. His compliance did not save him from suspicion, which was especially aroused by the friendship of his eldest son, the duke of Chartres, with Dumouriez, and when the news of the desertion of Chartres with Dumouriez became known at Paris all the Bourbons left in France, including Égalité, were ordered to be arrested on the 5th of April. He remained in prison till the month of October, when the Reign of Terror began. He was naturally the very sort of victim wanted, and he was decreed of accusation on 3rd of October. He was tried on the 6th of November and was guillotined on the same day, with a smile upon his lips and without any appearance of fear. No man ever was more blamed than Orleans during the Revolution, but the faults of ambition and intrigue were his friends', not his own; it was his friends who wished him to be on the throne. Personally he possessed the ambition manners of a polished grand seigneur: debauched and cynical, but never rude or cruel, full of gentle consideration for all about him but selfish in his pursuit of pleasure, he has had to bear a heavy load of blame, but it is ridiculous to describe the idle and courteous voluptuary as being a dark and designing scoundrel, capable of murder if it would serve his ambition. The execution of Philippe Égalité made the friend of Dumouriez, who was living in exile, duke of Orleans.

ORLEANS, LOUIS PHILIPPE ROBERT, DUKE OF (1860—), eldest son of the comte de Paris, was born at York House, Twickenham, on the 6th of February 1869. The law of exile against the French princes having been abrogated in 1871, he returned with his parents to France. He was first educated by a private tutor, and then followed the courses of the municipal college at Eu. In 1882 he entered the Collège Stanislas, Paris, and took a first prize in a competitive Latin translation. On the death of the comte de Chambord, the comte de Paris became head of the Bourbons; and in 1886 he and his son were exiled from France. Queen Victoria appointed the duke of Orleans a supernumerary cadet at the Royal Military College, Sandhurst. After passing his examinations he received a commission in the 4th battalion of the 60th Rifles, then quartered in India. In January 1888 the duke went out to India, accompanied by Colonel de Parseval as military governor and adviser. At Bombay he was received by the duke of Connaught and Lord Reay, and at Calcutta he became the guest of the viceroy, the marquess of Dufferin, who organized for the duke and his cousins, Prince Henry of Orleans, a grand tiger-shooting expedition in Nepal. The duke now reported himself to the commander-in-
chief, afterwards Earl Roberts, and joined his regiment at Charkota. After seeing service, the duke ceased his connexion with the Indian army in February 1890, and returned to England. On attaining his majority, he entered Paris (February 7, 1890), and proceeding to the maiest, expressed his desire, as a Frenchman, to perform his military service. This act caused great excitement, and he was arrested in conformity with the law of 1885, which forbade the soil of France to the direct heirs of the families which had reigned there. He was tried, and sentenced to two years' imprisonment; but he was liberated by President Carnot after a few months' nominal incarceration (June 4), and conducted to the Swiss frontier. This escapade won for him the title of "Le Premier Conscrit de France." After the comte de Paris's funeral (September 12, 1894) the duke received his adherents in London, and then removed to Brussels, as being nearer France. On the 5th of November 1896 the duke married the archduchess Maria Dorothea Amalia of Austria, the ceremony taking place at Vienna. It was alleged that some of his followers were implicated in the conspiracies against the French Republic in 1899. A letter which the duke wrote in 1900, approving the artist whose caricatures were grossly insulting to Queen Victoria, excited great indignation both in England and in many French circles, and estranged him from many with whom he had formerly been upon friendly terms; but after Queen Victoria's death it was known that this affair had been forgotten and forgiven by the British royal family. The duke of Orleans made several long exploring journeys, being particularly interested in polar discoveries. In 1905 he published Une croisade au Spitzberg, and, later, another account of his travels, under the title A travers la Banquise.

ORLEANS, PHILIP I., DUKE OF (1640-1701), son of the French king Louis XIII., was born at St Germain-en-Laye on the 21st of September 1640. In 1661 he was created duke of Orleans, and married Henrietta, sister of Charles II. of England; but the marriage was not a happy one, and the death of the duchess in 1670 was attributed to poison. Subsequently he married Charlotte Elizabeth, daughter of Charles Louis, elector palatine of the Rhine. Having fought with distinction in Flanders in 1667, Monsieur, as Orleans was generally called, returned to military life in 1672, and in 1677 gained a great victory at Cassel and took St Omer. Louis XIV., it was said, was jealous of his brother's success; and at all events Orleans never commanded his army again. He died at St Cloud on the 8th of June 1701, leaving as son, Philip, the regent Orleans, and two daughters: Anne Marie (1666-1728), wife of Victor Amadeus II., duke of Savoy; and Elizabeth Charlotte (1676-1744), wife of Leopold, duke of Lorraine. His eldest daughter, Marie Louise (1662-1689), wife of Charles II. of Spain, died before her father.

ORLEANS, PHILIP II., DUKE OF (1674-1723), regent of France, son of Philip I., duke of Orleans, and his second wife, the princess palatine, was born on the 2nd of August 1674, and had his first experience of arms at the siege of Mons in 1691. His marriage with Mlle de Blois, the legitimized daughter of Louis XIV., won him the favour of the king. He fought with distinction at Steinkerk, Neerwinden and Namur (1692-1695). During the next few years, being without employment, he studied natural science. He was next given a command in Italy (1706) and in Spain (1707-1708) where he gained some important successes, but he cherished lofty ambitions and was suspected of wishing to take the place of Philip V. on the throne. When Louis XIV. was angry at these pretensions, and for a long time held him in disfavour. In his will, however, he appointed him president of the council of regency of the young King Louis XV. (1715). After the death of the king, the duke of Orleans went to the parlement, had the will annulled, and himself invested with absolute power. At first he made a good use of this, counselling economy, decreasing taxation, disbasing 25,000 soldiers and restoring liberty to the persecuted Jansenists. But the inquisitorial measures which he had begun against the financiers led to disturbances. He was, moreover, weak enough to countenance the risky operations of the banker John Law (1717), whose bankruptcy led to such a disastrous crisis in the public and private affairs of France.

There existed a party of malcontents who wished to transfer the regency from Orleans to Philip V., king of Spain. A conspiracy was formed, under the inspiration of Cardinal Alberoni, first minister of Spain, and directed by the prince of Cellamare, Spanish ambassador in France, with the complicity of the duke and duchess of Maine; but in 1718 it was discovered and defeated. Dubois, formerly tutor to the duke of Orleans, and now his all-powerful minister, caused war to be declared against Spain, with the support of the emperor, and of England and Holland (Quaduple Alliance). After some successes of the French marshal, the duke of Berwick, in Spain, and of the imperial troops in Sicily, Philip V. made peace with the regent (1720).

On the majority of the king, which was declared on the 15th of February 1723, the duke of Orleans resigned the supreme power; but he became first minister to the king, and remained in office till his death on the 23rd of December 1723. The regent had great qualities, both brilliant and solid, which were unfortunately spoilt by an excessive taste for pleasure. His dissolve manners formed one too many imitators, and the regency is one of the most corrupt periods in French history.

ORLEANS, a city of north central France, chief town of the department of Loir-et-Cher, on the right bank of the Loire, 77 m. S.S.W. of Paris by rail. Pop. (1906), town, 57,544; commune, 68,614. At Les Aubrais, a mile to the north, is one of the chief railway junctions in the country. Besides the Paris and Orleans railway, which there divides into two main lines—a western to Nantes and Bordeaux via Tours, and a southern to Bourges and Toulouse via Vierzon—branches leave Les Aubrais eastwards for Pithiviers, Châlons-sur-Marne and Gien, north-west for Châteaudun and Rouen. The whole town of Orleans is clustered together on the right bank of the river and surrounded by fine boulevards, beyond which it sends out suburbs along the various roads. It is connected with the suburb of St Marceau on the left bank by a handsome stone bridge of nine arches, erected in 1793 by the architect Perrier. The river is canalized on the right, and serves as a continuation of the Orleans Canal, which unites the Loire with the Seine by the canal of the Loing.

Owing to its position on the northernmost point of the Loire Orleans has long been the centre of communication between the Loire basin and Paris. The chief interest of the place lies in its public buildings and the historical events of which it has been the scene. Proceeding from the railway station to the bridge over the Loire, the visitor crosses Orleans from north to south and passes through the Place du Martroi, the heart of the city. In the middle of the square stands an equestrian statue of Joan of Arc, in bronze, resting on a granite pedestal surrounded by bas-reliefs representing the leading episodes in her life. In 1855 it took the place of an older statue executed in the beginning of the century, which was then transferred to the left bank of the Loire at the end of the bridge, a few paces from the spot where a simple cross marks the site of the Fort des Tourelles captured by Joan of Arc in 1429. From the Place du Martroi, the Rue Jeanne d'Arc leads to the bridge. The great fire which burned in 1287, was burned by the Huguenots in 1567 before its completion. Henry IV., in 1601, laid the first stone of the new structure, the building of which continued until 1829. It consists of a vestibule, a nave with double aisles, a corresponding choir, a transept and an apse. Its length is 472 ft., its width at the transept 220 ft. and the height of the central vaults 112 ft. The west front has two flat-topped towers, each of three storeys, of which the first is square, the second octagonal and the third cylindrical. The whole front is Gothic, but was designed and constructed in the 18th century and exhibits all the defects of the period, though its
proportions are impressive. A central spire (15th century) 328 ft.
high, on the other hand, recalls the pure Gothic style of the
13th century. In the interior the choir chapels and the apse,
dating from the original erection of the building, and the fine
modern tomb of Mgr. F. A. P. Dupanloup, bishop from 1849 to
1878, are worthy of note. In the episcopal palace and the higher
seminary are several remarkable pictures and pieces of wood-
carving; and the latter building has a crypt of the 9th century,
belonging to the church of St Avit demolished in 1428. The
church of St Aignan consists of a transept and choir of the second
half of the 13th century; it contains in a gilded and carved
wooden shrine the remains of its patron saint, who occupied the
see of Orleans at the time of Attila’s invasion. The crypt dates
from the 9th to the beginning of the 12th century. The once
beautiful sculpture of the exterior has been altogether ruined;
the interior has been restored, but not in keeping with the
original style. A third church, St Euvrée, dedicated to one of
the oldest bishops of Orleans (d. 391), is an early Gothic building
dating from the 13th, completely restored in the 15th century.
St Pierre-le-Puellier dates in its oldest portions from the 10th or
even the 9th century. To the west of the Rue Bonvallot stand
the church of St Paul, whose façade and isolated tower both
bear fine features of Renaissance work, and Notre-Dame de
Recouvrance, rebuilt between 1537 and 1539 in the Renaissance
style and dedicated to the memory of the deliverance of the city.
The hôtel de ville, built under Francis I. and Henry II.
and restored in the 19th century, was formerly the residence of
the governors of Orleans, and was occupied by the kings and queens
of France from Francis II. to Henry IV. The front of the
building, with its different coloured bricks, its balconies sup-
sported by caryatides attributed to Jean Goujon, its gable-ends
and its windows, recalls the Flemish style. There are several
niches with statues. Beneath, between the double flight of steps
leading up to the entrance, stands a bronze reproduction of the
statue of Joan of Arc, a masterpiece of the princess Mary of
Orleans, preserved in the Versailles museum. The richly-
decorated apartments of the first storey contain paintings, interest-
ing chimney-pieces, and a bronze statuette (also by the princess Mary)
representing Joan of Arc mounted on a caparisoned horse and
clothed in the garb of the knights of the 15th century. The great
hall in which it is placed also possesses a chimney decorated with
three bas-reliefs of Domremy, Orleans and Reims, all associated
with her life. The historical museum at Orleans is one of the
most interesting of provincial collections, the numismatic,
medieval and Renaissance departments, and the collection of
ancient vases being of great value. The city also possesses a
separate picture gallery, a sculpture gallery and a natural history
museum, which are established in the former hôtel de ville, a Renaissance building of the latter half of the 16th century.
The public library comprises among its manuscripts a number
dating from the 7th century, and obtained in most cases from St Benoît on the Loire. The general hospital is incorporated with
the Hôtel Dieu, and forms one of the finest institutions of the
kind in France. The salle des fêtes, formerly the corn-market,
stands within a vast cloister formed by 13th-century arcades,
once belonging to the old cemetery. The salle des Thèses (1411)
of the university is the meeting-place of the Archaeological
Society of the city. Among the old private houses number
several of the Orleans, that of Agnes Sorel (15th and 16th century), which
contains a large collection of objects and works of art relating to
Joan of Arc, that of Francis I., of the first half of the 16th century,
that occupied by Joan of Arc during the siege of 1429, and that
known as the house of Diane de Poitiers (16th century), which
contains the historical museum, are of special interest. The
hôtel dela Vieille-Intendance, built in the 15th and 16th centuries,
served as residence of the intendants of Orleans in later times.
The “White Tower” is the last representative of the towers
rendered famous by the siege. A statue to the jurisconsult,
R. J. Pothier (1699-1772), one of the most illustrious
of the natives of Orleans, stands in front of the hôtel de ville. The
anniversary of the raising of the siege in 1429 by Joan of Arc is
celebrated every year with great pomp. After the English had
retired, the popular enthusiasm improvised a procession, which
marched with singing of hymns from the cathedral to St Paul,
and the ceremony is still repeated on the 8th of May by the clergy
and the civil and military functionaries. Orleans is the seat of
a bishopric, a prefect, a court of appeal, and a court of assizes
and headquarters of the V. army corps. There are tribunals of
first instance and of commerce, a board of trade-arbitration,
a chamber of commerce and a branch of the Bank of France;
and training colleges for both sexes, a lycée for boys, a technical
school and an ecclesiastical seminary.

The more important industries of the town are the manufacture
of tobacco (by the state), blankets, hairpins, vinegar, machinery,
agricultural implements, hosiery, tools and ironware, and the
preparation of preserved vegetables. Wine, wool, grain and
live stock are the commercial staples of the city, round which
there are important nurseries.

The site of Orleans must have been occupied very early in
history by a trading post for commerce between northern
and central and southern Gaul. At the time of the Roman conquest
the town was known as Génavum, and was the starting-point of
the great invasion of the tribe of the Saxon against Julius Caesar in 52 B.C. In the 6th century it had taken the name Aurelianum from either Marcus
Aurelius or Aurelian. It was virtually besieged in 451 by Attila,
who wasayed by the intercession of its bishop, St Aignan, and
finally driven off by the patrician Aetius. Odoscar and his
Saxons also failed to take it in 471, but in 486 it fell into the hands
of Clovis, who in 511 held here the first ecclesiastical council
assembled in France. The dignity which it then obtained, of
being the capital of a separate kingdom, was lost by its union
with that of Paris in 613. In the 10th century the town was given in
fief to the counts of Paris, who in 987 ousted the Carolingian
line from the throne of France. In 999 a great fire devastated
the town. Orleans remained during all the medieval period one of
the first cities of the French monarchy; several of the kings
dwelt within its walls, or were consecrated in its cathedral;
it had a royal mint, was the seat of councils, and obtained
for its schools the name of university (1309), and for its soldiers an
equal standing with those of Paris. Philip, fifth son of Philip VI.,
was the first of the dukes of Orleans. After the assassination
of his successor Louis by Jean Sans-Peur, duke of Burgundy (1407),
the people of Orleans sided resolutely with the Armagnacs,
and in this way brought upon themselves the attacks of the Burgundians and the English. Joan of Arc had
entering the beleaguered city on the 29th of April 1429, effected the raising
of the siege by means of an attack on the 7th of May on the Fort des Tourelles, in the course of which she was wounded.
Early in the 16th century the town became a centre of Pro-
estantism. After the Amboise conspiracy (1560) the state-
general were convoked at Orleans, where Francis II. died. In
1562 it became the headquarters of Louis I. of Bourbon,
prince of Condé, the Protestant commander-in-chief. In 1563
Francis, duke of Guise, laid siege to it, and had captured the
île-du-pont on the left bank of the Loire when he was assassina-
Orleans was surrendered to the king, who had its fortifica-
tions razed. It was held by the Huguenots from 1567 to 1568.
The St Bartholomew massacre there in 1572 lasted a whole week.
It was given as a lieu de sûreté to the League under Henry III.,
but surrendered to Henry IV. in person in 1594. During the
Revolution the city suffered from the extraordinary excesses
of Bertrand Barrère and Collot d’Herbois. It was occupied by
the Prussians in 1815 and 1870, the latter campaign being discussed
below.

See E. Bimbenet, Histoire de la ville d’Orléans (Orléans, 1884-
1888).

The Orleans Campaign of 1870

Orleans was the central point of the second portion of the
Franco-German War (q.v.), the city and the line of the Loire
being at first the rendezvous of the new armies improvised by
the government of National Defence and afterwards the starting-
point of the most important attempt made to relieve Paris.
The campaign has thus two well-marked phases, the first ending
with the first capture of Orleans on the 10th of October, and
the second with the final capture on the night of the 4th of December.

Shortly after the fall of the empire the government of National Defence, having decided that it must retreat in Paris in spite of Orleans—the rôle of the delegation was at first restricted to the establishment of a cordon of weak posts just out of reach of the German cavalry, with the object of protecting the formation of new corps and divisions in the interior. At the time of the investment of Paris part of the German forces were actually called in to reinforce the garrison. Only Reyau's weak cavalry division was sent out from Paris into the open country.

On the other side the Germans had not enough forces left, after investments of the I. and II. corps, and the German 4th cavalry division between Estampes and Toury was reinforced by some Bavarian battalions in consequence. But no important assemblies of French troops were noted, and indeed Orleans was twice evacuated on the mere rumour of an approach of the enemy. However, every soldier gave no credence to rumours of the formation of a 15th corps behind the Loire—Troc'h himself disbelieved in its existence—and the cavalry divisions, with their infantry supports, went about their ordinary business of gathering supplies.

In reality, however, the Russian, who was immediately ready as were its troops, was on the point of taking the offensive. In deference to popular clamour, a show of force in Beauce was decided upon. This was carried out by a force of all arms under Reyau on the 7th of October. It succeeded, and Troch himself disbelieved in its existence—and the cavalry divisions, with their infantry supports, went about their ordinary business of gathering supplies. In reality, however, the Russian, who was immediately ready as were its troops, was on the point of taking the offensive. In deference to popular clamour, a show of force in Beauce was decided upon. This was carried out by a force of all arms under Reyau on the 7th of October.

First capture of Orleans.

Orleans in great disorder. Being still without any real offensive intentions, the Delegation and La Motte-Rouge decided, the same night, to evacuate Orleans. On the 11th, therefore, von der Tann ordered his troops to withdraw to Tours, and thus a strong rearguard on the outskirts of Orleans. But he was no longer on the plain of Beauce; villas, hedges and vineyards, as well as the outskirts of the great forest of Orleans, gave excellent cover to the French infantry, all of which showed steadiness and some battalions true heroism, and the attack developed so slowly that the final positions of the defenders were not forced till close upon nightfall. The Germans lost at least 1000 men, and the harvest of prisoners proved to be no more than 1500. So far from pressing on to Tours, the Germans were well content with the occupation of Orleans.

The defeated enemy disappeared into Sologne, where the assailants could not follow. Rumours of all sorts began to assail the German commander, who could not collect reliable news by means of the agencies under his own control because of the fluctuating and dense cordon of mobiles and frances-tireurs all around him. Moltke and Blumenthal wished him to strike out southward towards the arsenals of Bourges, the depôts of vehicles of Tchétauroux and the improvised government offices at Tours. But he represented that he could count on no support from the peasants, or even from his nearest supports, and he was therefore allowed to stay at Orleans.

The 22nd division and the 4th cavalry division, however, were withdrawn from him, and under these conditions von der Tann was compelled to withdraw from Orleans. His chief uneasiness was emphasized by reports of the appearance of heavy masses of French troops on the Loire above and below Orleans—reports that were true as regards the side of Blois, and more or less false as regards the side of Chartres. Indeed, the 15th corps, which had already placed the left flank of the I. Bavarian corps at the right, was placed in two lines, the first, with the 10th Army headquarters on the 15th of October, and next day von der Tann was ordered “not to abandon Orleans unless threatened by a greatly superior force.” Such a threat soon became pronounced. General de Lampka placed the 10th Army headquarters at Tours, and ordered a force under Léon Gambetta, who arrived there by balloon from Paris and took control of the Delegation on the 11th. With de Freycinet who was appointed deputy minister of war as his most valued assistant, Gambetta was enabled to take a large part in the government in the provinces, but the actual director of the war, in virtue of the fact that he was the very incarnation of the spirit of resistance to the invader. De la Motte-Rouge was replaced at the head of the 15th corps by General d'Aurelle de Paladines, under whom at the same time embryonic 16th corps was placed. The new commander with practically dictatorial powers occupied himself first of all with the organization and training of his motley troops. The Delegation indeed planned an advance from Gien on Fontainebleau, but this was cut short by a French concentration at Orleans. Gambetta reinforced the troops at Salbris to the figure of 60,000, for the camp there was only a rendezvous but a school, the atmosphere of which profoundly affected even troops that only spent three or four days within its bounds. Meanwhile the 15th corps was formed at Blois and Vendôme, covered by a screen of frances-tireurs and National Guards. On October 23 a large force was sent over to the 16th corps from Salbris. This step was the first in a new plan of campaign.

A few days before it was taken, there had occurred an incident which led Moltke to a fresh misunderstanding of the situation towards the Loire. As mentioned above, the 22nd infantry and 4th cavalry divisions had been withdrawn from von der Tann's command, and on their way thither they were told to clear the country round Châteauneuf and Chartres. General von Wittich, therefore, with the 22nd division and some cavalry, appeared before Châteauneuf on the 15th and chased the French back into the town. In the evening de Tassigny took charge of the town, and on the 16th several engagements were fought in the town, with the French as their conventional resistance being subjected to it what was practically a sack.1 After this von Wittich passed on to Chartres, which, making his preparations more carefully, he was able to occupy after a few shells had been fired. These events, and the presence of a French force at Dreux, as a matter of fact signified nothing for the 15th and 16th corps were still on the Loire and at Salbris, but they were

---

1 In 1879 the government added the cross of the Legion of Honour to the town arms of Châteauneuf.
bewildered the German headquarters and conjured up a phantom "Army of the West," just as the promenade in Beauce had fashioned "the Army of the Loire" out of the small force under Royans. Once more, indeed, as so often in the war, the Germans tried to solve the French problem by German data, and in their devotion to the net idea of "full steam ahead," could not conceive of military activity being spasmodic or unaimed. But this time the Versailles strategists were wrong only in their guess as to the direction of the blow. A blow was certainly impending.

By now the deliverance of Paris had become the defined objective of the 'new formations' and of the provisional Delegation. Many plans were discussed, both at Paris and at Tours, for a combined effort, but each strategist had to convince the rest of the soundness of his own views, and the interchange of information and plans between Trochu and Gambetta was necessarily precarious. In the end, however, a few clear principles were accepted—Paris must be relieved, not merely revictualled, and the troops must be set in motion with that object at the earliest possible moment. For 200,000 French regulars were closely invested in Metz by Prince Frederick Charles with the I. and II. Armies, if they passed into captivity, the veterans of Vionville and St Privat could be brought over to the Loire, and already there were strange rumours of intrigues between Bazaine, Blanarck and the empress Eugénie. But de Freycinet and d'Aurelle had different views as to the method of recapturing Orleans, which was agreed upon as the first thing to be done, and a compromise had to be made, by which 25,000 men were to advance by Gien and Châteauneuf and the main mass (75,000) from Blois by Beaune, with the object of the double movement being minimized by the weakness of the forces under von der Tann (the highest estimate of these that reached Tours was 60,000 and their real number only 26,000). The preliminary movements were to be completed by the 29th of October, when one strong division of the 15th corps was to be set at Gien and the remainder of the 15th and 16th corps between Blois and Vendôme. This was duly carried out, and the Germans were confirmed in their suspicions of a concentration to the west of Paris by the despatch of dummy troop-trains to Le Mans. But bad weather, the news of the disastrous capitulation of Bazaine and the opening of a series of futile peace negotiations delayed the dénouement, the Ien column was hastily recalled, and the French armies stood fast all along the line in their original grouping, 75,000 men (15th and 16th corps) at Blois-Vendôme, 26,000 men in Sologne and 25,000 at Gien. The Germans round Orleans were some 25,000 strong. Between Monthéry and Chartres were 21,000 more; but these were paralysed by the fictitious "Western Army" of the French, and von Wittich even thought of obtaining assistance from von der Tann. The activity of the irregulars, and the defiant attitude of the civil population everywhere, presaged a blow to be delivered by the once despised "new formations," but the direction of this blow was misconceived by the German headquarters, by the staff of the III. Army and by von der Tann alike, till the eve of its delivery. The halt of the French army allowed this un easiness to grow, and, in default of a target, Mönte was unable to assign a definite task to the II. Army, now on its way from Metz. One of its corps, therefore, was sent to the lines before Paris to release the 17th and 22nd infantry divisions from siege duties, and these, with the I. Bavarian corps and the 2nd, 4th and 6th cavalry divisions, were constituted into a special detachment of the III. Army, under Friedrich Franz, grand duke of Mecklenburg-Schwerin. The duke was ordered to cover the siege of Paris and to break up the "new formations," but he was directed, not towards Orleans or even Tours, but towards Le Mans, concentrating with that object between Châteaudun and Chartres.

D'Aurelle, if cautious and slow, at least employed spare time well. The 16th corps was disciplined to the standard attained by the 15th and Chanzy was placed at the head of it. General Fléreck, commanding at Le Mans, was ordered to attract the enemy's notice to the west by demonstrations, the defence of localities by irregulars was thoroughly organized, and in the first days of November, on de Freycinet's demand, the general advance was resumed. There was a difference of opinion between d'Aurelle and Chanzy as to the objective, the latter wishing to make the main effort by the left, so as to cut off the Bavarians from Paris, the former, to make it by the right with a view to recapturing Orleans, and, as on the German side at Gravelotte, a compromise was made whereby the army was deployed in equal force all along the line.

The début was singularly encouraging. Part of the German 2nd cavalry division, with its infantry supports, was severely handled.
by the French advanced guard near the hamlet of St Laurent des Bois (November 8). The half-heartedness of the Germans, evidenced by the number of prisoners taken unwounded, greatly encouraged the 'new formations,' which cheerfully submitted to a cold bivouac in an open field. Next day the news of the battle of d'Aurelle with the 15th corps on the right wing, Chantilly with the 16th on the left and Reya's cavalry to the front. The march was made straight across country, in battle order, each brigade in line of battle, supported by reserve columns. The French generals were determined that no accident should occur to shake the morale of the young troops they commanded.

At Orleans, meanwhile, von der Tann, in ever-growing suspense, had thought wrongly, decided wrongly, and was then instructed by the headquarter staffs not to fall back except under heavy pressure. He had his own reputation, dimmed by the failure of 1866, to retrieve, and national honour and loyalty seemed to him to require, in the words of his own staff officer, that "ere the word was out, the retired Army of Orleans, with no hostile force should enter the city placed under the protection of the Bavarian." But he could not allow himself to be enveloped in Orleans itself, and therefore, calling upon the far-distant III. Army, von der Tann reoccupied Orleans, and sent his Horse Guards with all the troops around Coulommiers, leaving 2500 men to hold Orleans. The line of defence was from St. Pérvy on the Châteaudun road through Coulomiers to La Renardière, thence along the Mauve stream, and there he was attacked in force on the 9th of November. The French approached from the south-west, and when their right had taken contact, the remainder gradually swung round and attacked the Bavarian centre and right. The result was foreseen, given the disparity of forces, and, indeed, in the opening movements, the cavalry on the extreme left of d'Aurelle's line exposed Coulommiers to a partial repulse and saved the Bavarian right. When at last the French stormed Coulommiers, and von der Tann had been driven back, a new element in the struggle had entered. The remnants of the I. Bavarian corps were able to draw off unscathed. The Orleans garrison followed suit, and the French army, gathering in its two outlying columns from Sologne and Gien, reoccupied the city. So thorough was the Bavarian's evacuation of Orleans that it would indeed have been a crushing victory had Reya's cavalry performed its part in the scheme and above all had d'Aurelle, adopting unreservedly either his own plan or Chantilly's, massed his troops here to face the blow of the French. There indeed, in accordance with the plan, instead of retaining his enemy in equal strength at all points, he wished above all to avoid what is now called a 'regrettable incident'—hence his advance across country en bataille—and to thin out his line at any point might have been disastrous. And incomplete as it was, the Bavarian Army, marching as it did, did not even demand the presence of the I. Bavarian corps. The columns from Gien and the Sologne peacefully reoccupied Orleans, while the victors of Coulommiers went into cold and muddy bivouacs north of the city, for d'Aurelle feared that their dispersion in the country would be the death of their discipline. The French general knew that he had only put his hand to the plough, and he thought that before ploughing in earnest he must examine and overhaul his implement. In this opinion he was supported by the defects of the Bavarian Army in the matter of staying power of the men, but even by the government, which knew that the limit of the capital's resistance was still distant, and felt the present vital necessity of protecting Bourges, Châteauroux and Tours, united the Aisne, on this assumption of the 'new formations,' the largest possible force on the weakest point of Moltke's position. But in the east, where the left of the south, was rejected, and d'Aurelle organized a large fortified camp of instruction to the north of the captured city, to which came, beside the 15th and 16th corps, the new 17th and 18th.

To this extent the battle of d'Aurelle was an armistice for operations south of Paris. His objects in so doing, the chief of staff, for a lateral displacement of the whole army towards Chartres and Dreux, which would have left the prince without an animate target. The largest possible force on the weakest point of Moltke's position. But in the east, where the left of the south, was rejected, and d'Aurelle organized a large fortified camp of instruction to the north of the captured city, to which came, beside the 15th and 16th corps, the new 17th and 18th.

To this extent the battle of d'Aurelle was an armistice for operations south of Paris. His objects in so doing, the chief of staff, for a lateral displacement of the whole army towards Chartres and Dreux, which would have left the prince without an animate target. The largest possible force on the weakest point of Moltke's position. But in the east, where the left of the south, was rejected, and d'Aurelle organized a large fortified camp of instruction to the north of the captured city, to which came, beside the 15th and 16th corps, the new 17th and 18th.

German plans after Coulommiers must now be briefly summarized. On November the 1st he had written to the II. Army to the effect that 'the south of France is at stake, all the boundaries are in arms, and the strength of the French of the west towards Le Mans, the right wing of the II. Army at the same time hurrying on to Fontainebleau to cover the south side of the Paris investment. The king, however, less convinced than Moltke of the position of the army of the Loire, suspended the westward deployment of the Detachment, with the result that on the 10th the retreating Bavarians were reinforced by two fresh divisions. But they met and south towards the west. The French of the west towards Le Mans, the right wing of the II. Army at the same time hurrying on to Fontainebleau to cover the.
Forest of Orleans, the 19th corps away to the right rear at Angerville, and the X. equally distant to the south-east, as well as separated in three self-contained columns a day's march apart. It seemed as if another Vionville was at hand, but this time Alvensleben and Voigts-Rhetz would not be deceived. They stood fast, by the prince's order, to close up for battle and to wait on events in front of the Detachment.

The Germans had now discovered their target, and their strategical system, uncomplicated by past nightmares, should have worked smoothly. The prince had no such confusion between the various high officers as before. Prince Frederick Charles, in possession of the facts and almost in contact with the enemy, wrote to the grand duke to say that the II. Army was to be placed under the command of a general, whom he knew to be heading for Le Mans, should make a “diversion” in his favour towards Tours, reserving to himself and his own army, as on the 2nd of July 1866 before Koniggratz, the peril and the glory, and strike for the battle, to be as far away as possible from the 26th. By that date the last brigades of the II. Army would have come up, and the Detachment was to bring its own work accordingly. Yet even at this step Blumenthal, the everlastingly gloomy pessimist, promised no decisive event, as, without the king's order, the grand duke, assigned not Orleans but Beaugency, some miles down the river, as the objective of the Detachment.

D'Aurelle meanwhile had resolutely maintained his policy of inaction, contenting himself, with the news of the capture of Coulmiers from the 25th. This was more in the same spirit, condition of the troops that came from the east and the west to double the numbers of the relatively well-disciplined army of Coulmiers. In the grand duke's move to the west, D'Aurelle says, the French was not simply the victim of the approaching II. Army, the force of which he at first greatly exaggerated. All this time Gambetta and de Freycinet were receiving messages from Paris that spoke of desperate sorties being planned, and assigned December 15th as the last day of resistance. On the 16th November, De Deletrez wrote to D'Aurelle urging him to form a plan of active operations, without delay, and even suggesting one (which was, in fact, vicious), but in reply the general merely promised to study the civilian's scheme, expressing the hope that it might have a better effect. D'Aurelle had, in fact, become a pessimist, and the Delegation, instead of removing him, merely suggested fresh plans.

On the 24th, however, the French at last took the offensive, in the direction of Fontainebleau Forest, to co-operate with the great sortie from Paris which was now definitely arranged. But owing to D'Aurelle's objections, the first orders were modified so far as on attaining the points ordered, Châteaudun (15th corps), Bonlieu—Beaupré—Bellegarde (20th), the troops were to await the order to advance. Shortly afterwards the 18th corps from Gien was ordered to advance on the line Montargis-Ladon. The rest of D'Aurelle's huge army was scarcely affected by these movements. Meanwhile Prince Frederick Charles continued his strong reconnaissances of all arms from the front of the II. Army, and these naturally developed strong forces of the defenders. The advanced troops of the X. corps had severe engagements with friction at Bonlieu—Beaupré, almost before the march, and the III. corps were sharply repulsed at Neuville and drew the fire of several battalions and batteries at Artenay. The French offensive slowly developed on the 25th and 26th, for the Germans were not cut off. The rapid movements of the grand duke towards Le Mans before he was recalled to the Loire had seriously disquieted both the Delegation and D'Aurelle, and the 17th corps, under a young and energetic leader, deplorable was despatched to make an attack on the north and east of the city. The 18th corps, the north-west of Châteaudun. A fight at Brou (10 m. W. of Bonneval) provoked the grand duke into another false move. This time the Detachment, then near Droué (12 m. W. of Châteaudun) and Autun (22 m. W. of Bonneval), was slightly round, as was also the 18th corps. D'Aurelle was forced to be brought back by the drastic method of placing it under the orders of Prince Frederick Charles. General von Stosch of the headquarters staff was at the same time sent to act as Molthe's representative with the duke's headquarters, and Lieut.-Colonel von Waldesre to Prince Frederick Charles's to report thence direct to the king, who was dissatisfied with the diluted information with which the various staff officers furnished him. Still, the upshot was that Prince Frederick Charles was entrusted with affairs on the Loire, and all superior control was voluntarily surrendered. The prince had very clear ideas, at the outset, of the task before him. If the French advanced towards Fontainebleau or elsewhere, he expected to be able to repeat Napoleon's strategy of 1814, fighting 'concentrated' with his army. and X. Corps and bleeding blow after blow at different points on d'Auren's line of march with the III. If the French, as seemed more likely, stood fast, he thought his task more formidable, and accordingly, in the interval of rest, decided on the development, he ordered the Detachment inwards with the intention of directly attacking the Orleans position from the north-west.

As regards the method of the offensive, there is herein no material advantage on the French's first scheme; the detachment is simply a diversion, the main body of the army towards Orleans being abandoned. But the prince was at any rate a leader who enjoyed the responsibility of the director of operations— he even said that he would have the shuttle-play of the III. corps alluded to above "an honour," for Frederick Charles's 'development brief to Orleans road (which the prince still thought it his duty to cover) to Beaugency-Rolande. The Detachment, which never yet had concentrated save to deliver blows in the air, was approaching Châteaudun and Orsanger, in the morning of the 28th, under command of General Crouzet. But the French, having the want of combination between the various units of the French and the arrival in the afternoon of part of the III. corps saved the X. from an annihilation. As it was, the Germans engaged were utterly exhausted, and the X. corps had but the tiniest personal remnant of any hope left. The German resistance of the men of Vionville prolonged the fight until night had fallen and Crouzet, thinking the battle lost, ordered his troops to evacuate the battlefield. As at Coulmiers, and with even more deplorable results, the troops were got away, to the amazement of the line, and feared to hazard the issue of the campaign on the mere supposition that the enemy was even more exhausted. There was another resemblance, too, between Coulmiers and Beaugency-Rolande. In both cases, the fact of the French advance towards Artenay stood idle without attempting to influence the decision. Prince Frederick Charles himself took only a cursory survey of the battlefield, and failed to realize that the whole of the enemy's right wing had been engaged, in spite of what Waldesre, who had been in Beaugency, told him of events there. So far, therefore, from considering the battle as a great victory to be followed up by an energetic pursuit, he still feared a move round his left flank from Gien to Montargis towards Fontainebleau. The II. Army orders issued to the troops on the 29th had in view "the gain of the tension eastward." Beaugency-Rolande was a French defeat without being a German victory, and for the fact that it was a defeat, not a mere check, there was no cause but Crouzet's impulsive desire of the day in action. General von Stosch, in the newly promoted levies in his army, was the most susceptible of unreasonable bravery and unreasonable depression.

In view of this, d'Aurelle and Prince Frederick decided that the offensive was at an end. The 18th corps was directed towards Beaugency-Rolande, but the remains of the 17th corps from the front of the steadier 15th and 16th corps towards Pithiviers, and with that object, on the 29th—a day of inaction for the Germans—the 18th and 20th corps began to close on the centre. There was a total of 135,000 French, the main body now on the eastern and fringes of the Forest of Orleans, in which for the most part the French were successful. On the 29th the II. Army was inactive in spite of almost frantic appeals from Versailles to go or (as Napoleon had begun), and the Detachment, in accordance with the prince's orders, proposed to remain, but was over-ridden by von Stosch, headed eastward to prolong the right of the II. Army, halting on the 29th in the area Ogres-Tours. The prince's message to the grand duke contained the significant phrase, "my plans to drive the enemy out of Orleans'—he no longer thought of a strategic envelopment of the Army of the Loire in Orleans. Disillusioned during the 30th as to the supposed danger on the side of Montargis, he closed from both wings towards the centre, but still defensively and well clear of the danger forest.
ORLEY

On this day d'Aurelle and the French generals assembled to receive de Freycinet's orders for the next advance. The 18th and 20th corps were to attack Beaune-la-Roland, the 15th and 16th Pithivers, while the 17th, aided by the 21st from Lo Mans, was to look after the security of Orleans against the Detachment. The mobilization arrangement was between d'Aurelle and Chantilly, whereby the first day's operations should be directed to driving away the Detachment with the 17th and 16th corps, preparatory to the move on Pithiviers. On the 1st of December, then, the 21st division, under von Stoch, was ordered to return to the II. Army with his division, managed to impress Stoch, in a farewell interview, with the immensity of the danger, and a still more urgent argument was the action of Villepont- c' ey and its forces in the 21st division attached part of the I. Bavarian corps and drove it to Orgères with a loss of 1000 men. Von Stoch, therefore, so far from literally obeying the waiting policy indicated in the orders from Prince Frederick Charles, cautiously led the grand duke to prepare for the battle, and the grand duke, seeing the chance of which he had been cheated so often, and secure in his royal rank and in the support of Moltke, Stoch and Blumenthal, took control again. Lastly, von Stoch called back the 22nd division, which had been taken from Orleans and thence to the southward for the battle that part of the army it had defeated at Loigny, and protecting itself on the outer flank by a flank guard (I. Bavarians) against the rear, had closed in towards Chevilly. Prince Frederick Charles, however, found the low bridge across the river Chevilly too well guarded for an advance to be continued and the French positions about Chevilly stormed in the dark, but fortunately was dissuaded from von Stoch, who rode over to his headquarters. But the prince never (except perhaps on a brief moment during the evening) believed that the battle was won in the way of the Detachment except its own fears, and repeatedly impressed upon Stoch the fact that Orleans was the watchword and the objective for every one.

Battle of Logny-Poupory.

The advance of the idée fixe, the prince issued orders for the 4th to the following effect: III. corps to advance on Orleans and to "bring artillery into action against the city," at the same time carefully guarding his left flank; IX. and 4th cavalry division to go forward along the general line of the main road; Detachment, under the charge of the Prince Adine, to make an enveloping attack on Gidy in concert with the attack of the IX. corps. In the forest Alvensleben, knowing that he could not capture Orleans single-handed, guarded his left with a whole division and gave the other actions. To the village of Vaumont, which was stubbornly defended by a small French force, and close upon nightfall perfidiously threw a few shells into Orleans. The flank-guard division had meanwhile been gravely imperilled by the advance of Crouzet's 20th corps, but once again the III. corps was sent forward. Prince Stoch observed that the left group could not hold its position in advance of the Loire, and that the line of retreat of the right group was by Gien, ordered the fight to be broken off.

Second Battle of Orleans.

The 18th and 20th corps fought hard all day, progressed no farther than Cercottes. The prince and the grand duke had a short interview, but, being personal enemies, their intercourse was confined to the prince's issuing orders to his officers and its opponents. Thus while the main body of the French left group, under the determined Chantilly, slipped away to the left, to continue the struggle for three months longer, the 18th and 20th corps had to retreat to the main body in the wings of the corps. But it was handled resolutely, and in the afternoon its right swung in to Orleans. The 2nd cavalry division, finding a target and open ground, charged the demoralized defenders with great effect, a panic began and spread, and by nightfall, when the prince, who was at Orleans, had issued orders to suspend the fight, his rival and subordinate was marching into Orleans with bands playing and colours flying. There was no pursuit, and the severed wings of the French army were made prisoners of war. The campaign as two separate armies under Chantilly and Bourkabi respectively.

(C. F. A.)

ORLEY, BERNARD VAN (1491-1542), Flemish painter, the son and pupil of the painter Valently van Orley, was born at

1 The same night Moltke received copies of the prince's orders and also news of the victory of Loigny-Poupory, but for some reason that is still unknown he let events take their course.

2 A common error of the French, who were responsible for the failure. Gambetta had for some days been giving orders to the 18th and 20th corps direct, but precisely at the moment he handed over the control of the group to d'Aurelle, this being arranged over the wires while the III. corps was advancing.
Brussels and completed his art education in Rome in the school of Raphael. He returned to Brussels, where he held an appointment as court painter to Margaret of Austria until 1527, in which year he lost this position and left the city. He only returned to it upon being reinstated by Mary of Hungary in 1532, and died there in 1542. Whilst in his earlier work he continued the tradition of the Van Eycks and their followers, he inaugurated a new era in Flemish art by introducing into his native country the Italian manner of the later Renaissance, the style of which he had acquired during his sojourn in Rome. His art marks the passing from the Gothic to the Renaissance period; he is the chief figure in the period of decline which preceded the advent of Rubens. Meticulously careful execution, brilliant colouring, and an almost Umbrian sense of design are the chief characteristics of his work.

Van Orley, together with Michael Cockie, superintended the execution of van Aelst's tapestries for the Vatican, after Raphael's designs, and is himself responsible for some remarkable tapestry designs, such as the panels at Hampton Court. His also are the designs for some of the stained glass windows in the cathedral of Ste Gudule, in Brussels, at the museum of which city are a number of his principal works, notably the triptych representing "The Patience of Job" (1521). Among his finest paintings is a "Trinity" at Lièbeck cathedral, a "Pietà" at Brussels, a Madonna at Munich and another at Liverpool.

The National Gallery owns a "Madgalen, reading," another version of which is subject being at the Dublin National Gallery. Lord Northbrook possesses a portrait of Charles V. by the master.

ORLOV, the name of a noble Russian family that produced several distinguished statesmen, diplomatists and soldiers.

Gregory (Grigorii) Grigorievich Orlov, Count (1734-1783), Russian statesman, was the son of Gregory Orlov, governor of Great Novgorod. He was educated in the corps of cadets at St Petersburg, began his military career in the Seven Years' War, and was wounded at Zorndorf. While serving in the capital as an artillery officer he caught the fancy of Catherine II., and was the leader of the conspiracy which resulted in the dethronement and death of Peter III. (1762). After the event, Catherine raised him to the rank of count and made him adjutant-general, director-general of engineers and general-in-chief. At one time the empress thought of marrying her favourite, but the plan was frustrated by Nikita Panin. Orlov's influence became paramount after the discovery of the Khitrovo plot to murder the whole Orlov family. Gregory Orlov was no statesman, but he had a quick wit, a fairly accurate appreciation of current events, and was a useful and sympathetic counsellor during the earlier portion of Catherine's reign. He entered with enthusiasm, both from patriotic and from economical motives, into the question of the improvement of the condition of the serfs and their partial emancipation. He was also their most prominent advocate in the great commission of 1767, though he aimed primarily at pleasing the empress, who affected great liberality in her earlier years. He was one of the earliest propagandists of the Slavophil idea of the emancipation of the Christians from the Turkish yoke. In 1771 he was sent as first Russian envoy to Constantinople, to the particular displeasure of Foschini; but he failed in his mission, owing partly to the obstinacy of the Turks, and partly (according to Panin) to his own outrageous insolence. On returning without permission to St Petersburg, he found himself superseded in the empress's favour by Vasil'chikov.

When Potemkin, in 1771, superseded Vasil'chikov, Orlov became of no account at court and went abroad for some years. He returned to Russia a few months previously to his death, which took place at Moscow in 1780. For some time before his death he was out of his mind. Late in life he married his niece, Madame Zinoveva, but left no children.

See A. F. Barsovsky, Narratives from Russian History in the 18th Century (St Petersburg, 1884).

Alexis Grigorievich Orlov, Count (1737-1808), brother of the above, was by far the ablest member of the Orlov county family, and was also remarkable for his athletic strength and dexterity. In the revolution of 1762 he played an even more important part than his brother Gregory. It was he who conveyed Peter III. to the château of Ropsch and murdered him there with his own hands. In 1770 he was appointed commander-in-chief of the fleet sent against the Turks, whose far superior navy he annihilated at Chesme (July 3th 1770), a victory which led to the conquest of the Greek archipelago. For this exploit he received, in 1774, the honorific epithet Chesmensky, and the privilege of quartering the imperial arms in his shield. The same year he went into retirement and settled at Moscow. He devoted himself to horse-breeding, and produced the finest race of horses then known by crossing Arab and Frisian, and Arab and English studs. In the war with Napoleon during 1806-07 Orlov commanded the militia of the fifth district, which was placed on a war footing almost entirely at his own expense. He left an estate worth five millions of roubles and 30,000 swords.

Theodore (Fedor) Grigorievich Orlov, Count (1741-1796), Russian general, first distinguished himself in the Seven Years' War. He participated with his elder brothers, Gregory and Alexis, in the coup d'état of 1762, after which he was appointed chief procurator of the senate. During the first Turkish War of Catherine II. he served under Admiral Spiridov, and was one of the first to break through the Turkish line of battle at Chesme. Subsequently, at Hydra, he put to flight eighteen Turkish vessels. These exploits were, by the order of Catherine, commemorated by a triumphal column, crowned with naval trophies, erected at Tsarskoe Selo. In 1775 he retired from the public service. Orlov was never married, but had five natural children, whom Catherine ennobled and legitimatized.

Alexis Fedorovich Orlov, Prince (1787-1862), Russian statesman, the son of a natural son of Count Theodore Grigorievich Orlov, took part in all the Napoleonic wars from 1805 to the capture of Paris. For his services as commander of the cavalry regiment of the Life Guards on the occasion of the rebellion of 1825 he was created a count, and in the Turkish War of 1828-29 rose to the rank of lieutenant-general. It is from this time that the brilliant diplomatic career of Orlov begins. He was the Russian plenipotentiary at the peace of Adrianople, and in 1833 was appointed Russian ambassador at Constantinople, holding at the same time the post of commander-in-chief of the Black Sea fleet. He was, indeed, one of the most trusted agents of Nicholas I., whom in 1837 he accompanied on his foreign tour. In 1854 he was sent to Vienna to bring Austria over to the side of Russia, but without success. In 1856 he was one of the plenipotentiaries who concluded the peace of Paris. The same year he was raised to the dignity of prince, and was appointed president of the imperial council of state and of the council of ministers. In 1857, during the absence of the emperor, he presided over the commission formed to consider the question of the emancipation of the serfs, to which he was altogether hostile.

His only son, Prince Nikolai Alekseyevich Orlov (1827-1883), was a distinguished Russian diplomatist and author. He first adopted a military career, and was seriously wounded in the Crimean War. Subsequently he entered the diplomatic service, and represented Russia successively at Brussels (1860-1870), Paris (1870-1882) and Berlin (1882-1885). As a publicist he stood in the forefront of reform. His articles on corporal punishment, which appeared in Russkaya Starina in 1881, brought about its abolition. He also advocated tolerance towards the dissenters. His historical work, Sketch of Three Weeks' Campaign in 1856 (St Petersburg, 1856) is still of value.

ORM ("Ormin"), the author of an English book, called himself Orminium ("because Ormin made it "); consisting of metrical homilies on the gospels read at mass. The unique MS., now in the Bodleian Library, is certainly Orm's autograph, and contains abundant corrections by his own hand. On palaeographical grounds it is referred to about A.D. 1300, and this date is supported by the linguistic evidence. The dialect is midland, with some northern features. It is marked in an
unparalleled degree by the abundance of Scandinavian words, while the French element in its vocabulary is extraordinarily small. The precise determination of the locality is not free from difficulty, as it is now recognized that the criteria formerly relied on for distinguishing between the eastern and the western varieties of the midland dialect are not valid, at least for this early period. The *Ormulum* certainly contains a surprisingly large number of words that are otherwise peculiar to western texts; but the inference that might be drawn from this fact appears to be untenable in face of the remarkable lexical affinities between this work and *Havelok*, which is certainly of north-east midland origin. On the whole, the language of the *Ormulum* seems to point to north Lincolnshire as the author’s native district.

The work is dedicated to a certain Walter, at whose request it was composed, and whomOrm addresses as his brother in a threefold sense—“according to the flesh,” as his fellow-Christian, and as being a member of the same religious fraternity, that of the Augustinian Canons. The present writer has suggested (S Uthacem, 15th May 1906) thatOrm and Walter may have been inmates of the Augustinian priory of Elsham, near the Humber, which was established about the middle of the 12th century by Walter de Amundeville. In his foundation charter (Dugdale's *Monasticon*, ed. Caley and Bandinel, vi. 56) Walter endows the priory with lands, and also grants to it the services of certain villeins, among whom are his steward (*praepositus*) William, son of Leofwine, and his wife and family. As this William is said to have had an uncle namedOrm, and probably owed his Norman name to a godfather belonging to the Amundeville family, it seems not unlikely that the author of the *Ormulum* and his brotherWalter were his sons, named respectively after their father’s uncle and his lord, and that they entered the religious house of which they had been made subjects.

The name Orm is Scandinavian (Old Norse *Orm*, literally “serpent,” corresponding to the Old Eng. *wyrm* “worm”), and of course occurs in the names of the English part of England. The Gallicized form Orin is found only in one passage, where the author gives it as the name by which he was christened. If this statement be meant literally (i.e. if the writer was not merely treating the two names as equivalent), it shows that he must, like his brother, have had a Norman godfather. The ending -in was frequently appended to names in Old French, e.g. in *Johannin* for *Johan*, John. The title *Ormulum* for the book which Orm made was probably an imitation of *Speculum*, a common medieval name for books of devotion or religious edification.

The *Ormulum* is written in lines alternately of eight and seven syllables, without either rhyme or alliteration. The rhythm may be seen from the opening couplet:

Nu, broferr Walter, broferr min
After þe flæschy kinde.

The extant portion of the work, not including the dedication and introduction, consists of about 20,000 lines. But the table of contents refers to 242 homilies, of which only 31 are preserved; and as the dedication implies that the book had been completed, and that it included homilies on the gospels for nearly all the year, it would seem that the huge fragment which we possess is not much more than one-eighth of this extraordinary monument of pious industry.

The *Ormulum* is entirely destitute of poetic merit, though the author’s visible enjoyment of his task renders it not uninteresting reading. To the history of biblical interpretation and of theological ideas it probably contributes little or nothing that is not well-known from other sources. For the philologist, however, the work is of immense value, partly as a unique specimen of the north-midland dialect of the period, and partly because the author had invented an original system of phonetic spelling, which throws great light on the contemporary pronunciation of the language. In closed syllables the shortness of a vowel is indicated by the doubling of the following consonant. In open syllables this method would have been misleading, as it would have suggested a phonetic doubling of the consonant. But the foible of the Ormeln writer would not pass over to the ground which he was covering.

cases Orm had recourse to the device of placing the mark over the vowel. Frequently, but apparently not according to any discoverable rule, he distinguishes long vowels by one, two or three accents over the letter. Like some earlier writers, he retained the Old English form of the letter *g* (which he expressed as a spirant sound (not, however, distinguishing between the guttural and the palatal spirant)), and used the continental *g* for the guttural stop and the sound *dh*. He was, however, original in distinguishing the two latter sounds by using slightly different forms of the letter. This fact was unfortunately not perceived by the editors, so that the printed text confounds the two symbols throughout. The discovery was made by Professor A. S. Napier in 1890. It must be confessed that Orm often forgets his own rules of spelling, and although hundreds of oversights are corrected by interlineation, many inconsistencies still remain. Nevertheless, the orthography of the *Ormulum* is the most valuable existing source of information on the development of sounds in Middle English.

The *Ormulum* was edited for the first time by R. M. White in 1854. A revised edition, by R. Holt, was published in 1878. Many important corrections of the text were given by E. Köhling in the first volume of *Englische Studien*. With reference to the three forms of the letter *g* see A. S. Napier, *Notes on the Orthography of the Ormulum* (Engl. Assoc, 12th S., 1894). (H. Br.)

**ORMAZD** or **ORMUZD** (O. Persian *Auramazd* or *Ahramazd*), the supreme deity of Zoroastrianism. He is represented as the god and creator of good, light, intelligence, in perpetual opposition to Ahriman the lord of evil, darkness and ignorance.

The dualism of the earlier Zoroastrians, which may be compared with the Christian doctrine of God and Satan, gradually tended in later times towards monotheism. At all times it was believed that Ormazd would ultimately vanquish Ahriman. See further ZOROASTER.

**ORME, ROBERT** (1728–1801), English historian of India, was born at Anjengo on the Malabar coast on the 25th of December 1728, in the family of Nathaniel Orme, of the English part of England. Educated at Harrow, he was appointed to a writership in Bengal in 1743. He returned to England in 1753 in the same ship with Clive, with whom he formed a close friendship. From 1754 to 1758 he was a member of council at Madras, in which capacity he largely influenced the sending of Clive to Calcutta to avenge the catastrophe of the Black Hole. His great work—*A History of the Military Transactions of the British Nation in Indostan from 1745*—was published in three volumes in 1763 and 1778 (Madras reprint, 1861–1862). This was followed by a volume of *Historical Fragments* (1781), dealing with an earlier period.

In 1769 he was appointed historiographer to the East India Company. He died at Ealing on the 13th of January 1801. His valuable collections of MSS. are in the India Office library. The characteristics of his work, of which the influence is admirably shown in Thackery's *The Newcomes*, are thus described by Macaulay: "Orme, inferior to no English historian in style and power of painting, is minute even to tediousness. In one volume he allot, on an average, a closely printed quarto page to the events of every forty-eight hours. The consequence is that his narrative, though one of the most authentic and one of the most finely written in our language, has never been very popular, and is now scarcely ever read." Not a few of the most picturesque passages in Macaulay's own Essay on Clive are borrowed from Orme.

**ORMERO, ELEANOR A.** (1838–1901), English entomologist, was the daughter of George Ormerod, F.R.S., author of *The History of Cheshire*, and was born at Sedbury Park, Gloucestershire, on the 11th of May 1838. From her earliest childhood insects were her delight, and the opportunity afforded for entomological study by the large estate upon which she grew up and the interest she took in agriculture generally soon made her a local authority upon this subject. When, in 1868, the Royal Horticultural Society began forming a collection of insect pests of the farm for practical purposes, Miss Ormerod largely contributed to it, and was awarded the Flora medal of the society. In 1877 she issued a pamphlet, *Notes for Observations*.
ORMOC—ORMONDE, EARL AND MARQUESS OF

ORMONDE, EARL AND MARQUESS OF, titles still held by the famous Irish family of Butler (q.v.), the name being taken from a district now part of Co. Tipperary. In 1328 James Butler (c. 1305–1337), a son of Edmund Butler, was created earl of Ormond, one reason for his elevation being the fact that his wife Eleanor, a daughter of Humphrey Bohun, earl of Hereford, was a granddaughter of King Edward I. His son James, the 2nd earl (1331–1382), was four times governor of Ireland; the latter's grandson James, the 4th earl (d. 1452), held the same position several times, and won repute not only as a soldier, but as a scholar. His son James, the 5th earl (1420–1461), was created an English peer as earl of Wiltshire in 1449. A turbulent partisan of the house of Lancaster, he was lord high treasurer of England in 1455 and again in 1450, and was taken prisoner after the battle of Towton in 1461. He and his two brothers were then attainted, and he died without issue, the exact date of his death being unknown. The attainder was repealed in the Irish parliament in 1476, when his brother Sir John Butler (c. 1442–1478), who had been pardoned by Edward IV. a few years previously, became 6th earl of Ormond. John, who was a fine linguist, served Edward IV. as ambassador to many European princes, and this king is said to have described him as "the goodliest knight he ever beheld and the finest gentleman in Christendom." His brother Thomas, the 7th earl (c. 1424–1515), a courtier and an English baron under Richard III. and Henry VIII., was ambassador to France and to Burgundy; he left no sons, and on his death in August 1515 his earldom reverted to the crown.

Margaret, a daughter of this earl, married Sir William Boley of Blickling, and their son Sir Thomas Boley (1477–1539) was created earl of Ormonde and of Wiltshire in 1529. He went on several important errands for Henry VIII., during one of which he arranged the preliminaries for the Field of the Cloth of Gold; he was lord privy seal from 1530 to 1536, and served the king in many other ways. He was the father of Henry's queen, Anne Boleyn. Meanwhile, in 1515 the title of earl of Ormonde had been assumed by Sir Piers Butler (c. 1467–1539), a cousin of the 7th earl, and a man of great influence in Ireland. He was lord deputy, and later lord treasurer of Ireland, and in 1528 he surrendered his claim to the earldom of Ormonde and was created earl of Ossory. Then in 1538 he was made earl of Ormonde, this being a new creation; however, he counts as the 8th earl of the Butler family. In 1550 his second son Richard (d. 1571) was created Viscount Mountgarret, a title still held by the Butlers. The 8th earl's son, James, the 9th earl (c. 1490–1540), lord high treasurer of Ireland, was created Viscount Thurles in 1536. In 1544 an act of parliament confirmed him in the possession of his earldom, which, for practical purposes, was declared to be the creation of 1528, and not the new creation of 1538.

Thomas, the 10th earl (1532–1614), a son of the 9th earl, was lord high treasurer of Ireland and a very prominent personage during the latter part of the 16th century. He was a Protestant and threw his great influence on the side of the English queen and her ministers in their efforts to crush the Irish rebels, but he was perhaps more anxious to prosecute a fierce feud with his hereditary foe, the earl of Desmond, this struggle between the two factions desolating Munster for many years. His successor was his nephew Walter (1569–1633), who was imprisoned from 1617 to 1625 for refusing to surrender the Ormonde estates to his cousin Elizabeth, the wife of Sir R. Preston and the only daughter of the 9th earl. He was deprived of the palatine rights in the county of Tipperary, which had belonged to his ancestors for 400 years, but he recovered many of the family estates after his release from prison in 1625.

Walter's grandson, James, the 12th earl, was created marquess of Ormonde in 1642 and duke of Ormonde in 1661 (see below); his son was Thomas Butler, earl of Ossory (q.v.), and his grandson was James Butler, 2nd duke of Ormonde (see above).

On Injurious Insects, which was distributed among persons interested in this line of inquiry, who readily sent in the results of their researches, and was thus the beginning of the well-known Annual Series of Reports on Injurious Insects and Farm Pests. In 1881 Miss Ormerod published a special report upon the "turnip-fly," and in 1882 was appointed consulting entomologist to the Royal Agricultural Society, a post she held until 1892. For several years she was lecturer on scientific entomology at the Royal Agricultural College, Cirencester. Her fame was not confined to England: she received silver and gold medals from the university of Moscow for her models of insects injurious to plants, and her treatise on The Injurious Insects of South Africa showed wide her range. In 1899 she received the large silver medal from the Société Nationale d'Acclimatisation de France. Among others of her works are the Colored Journals, Manual of Injurious Insects, and Handbook of Insects injurious to Orchard and Bush Fruits. Almost the last honour which fell to her was the honorary degree of L.L.D. of Edinburgh University—a unique distinction, for she was the first woman upon whom the university had conferred this degree. The dean of the legal faculty in making the presentation aptly summoned up Miss Ormerod's services as follows: "The pre-eminent position which Miss Ormerod holds in the world of science is the reward of patient study and unwearying observation. Her investigations have been chiefly directed towards the discovery of methods for the prevention of the ravages of those insects which are injurious to orchard, field and forest. Her labours have been crowned with such success that she is entitled to be hailed the protectress of agriculture and the fruits of the earth—a beneficent Demeter of the 19th century." She died at St Albans on the 10th of July 1901.

ORMOC, a town of the province of Leyte, island of Leyte, Philippine Islands, on the W. coast about 35 m. S.W. of Tacloban. Pop. (1903), after the annexation of Albuer, 20,761. There are thirty-three barrios or villages in the town, and the largest of the four main villages is in 1903 of 5,419. The language is Visayan. Ormoc is in a great hemp-producing region and is open to coast trade.

ORMOLU (Fr. or moul, gold ground or pounded), an alloy of copper and zinc, sometimes with an addition of tin. The name is also used to describe gilded brass or copper. The tint of ormolu approximates closely to that of gold; it is heightened by a wash of gold lacquer, by immersion in dilute sulphuric acid, or by burning. The principal use of ormolu is for the mountings of furniture. With it the great French ébénistes of the 18th century obtained results which, in the most finished examples, are almost as fine as jewelers' work. The mounts were usually cast and then chiselled with extraordinary skill and delicacy.

ORMOND, a village and winter resort of Volusia county, Florida, U.S.A., about 68 m. by rail S. of St. Augustine. It is situated on the Halifax river, an arm of the Atlantic Ocean, extending for 25 m. along the E. coast of Florida. Pop. (1900) 595; (1905) 650; (1910) 780. It is served by the Florida East Coast Railway. The Halifax river region is famous for its excellent oranges and grape-fruit. The hard and compact Ormond-Daytona beach, about 200 ft. wide at low tide and about 20 m. long, offers exceptional facilities for driving, motoring and bicycling; on it are held the annual tournaments of the Florida East Coast Automobile Association. The old King's Road, built by the English between 1763 and 1783, from St Mary's, Georgia, some 400 m. to the south, has been improved for automobiles between Ormond and Jacksonville. About 5 m. west of Ormond are the ruins of an old sugar mill, probably dating from the last quarter of the 18th century and not, as is frequently said, from the Spanish occupation in the 16th century. About 5 m. south of Ormond and also on the Halifax river is another popular winter resort, Daytona (pop. 1900, 1900; 1905, 2109; 1910, 3183), founded in 1870 as Tomoka by Mathias Day of Mansfield, Ohio, in whose honour it was renamed Daytona in 1871. Its streets and drives are shaded by live oaks, palmettos, hickories and magnolias.
When Charles Butler, earl of Arran (1671–1758), the brother and successor of the 2nd duke, died in December 1758, the dukedom and marquessate became extinct, but the earldom was claimed by a kinsman, John Butler (d. 1766). John’s cousin, Walter (1703–1785), inherited this claim, and Walter’s son John (1737–1795) obtained a confirmation of it from the Irish House of Lords in 1791. He is reckoned as the 17th earl. His son Walter, the 18th earl (1770–1820), was created marquess of Ormonde in 1816, a title which became extinct on his death, but was revived in favour of his brother James (1774–1838) in 1825. James was the grandfather of James Edward William Theobald Butler (b. 1844), who became the 3rd marquess in 1854. The marquess sits in the House of Lords as Baron Ormonde of Llanthony, a creation of 1821.

**ORMONDE, JAMES BUTLER, 1ST DUKE OF (1610–1688),**
Irish statesman and soldier, eldest son of Thomas Butler, Viscount Thurles, and of Elizabeth, daughter of Sir John Poyntz, and grandson of Walter, 11th earl of Ormonde (see above), was born in London on the 19th of October 1610. On the death of his father by drowning in 1619, the boy was made a royal ward by James I., removed from his Roman Catholic tutor, and placed in the household of Abbot, archbishop of Canterbury, with whom he stayed until 1625, residing afterwards in Ireland with his grandfather. In 1629, by his marriage with his cousin, the Lady Elizabeth Preston, daughter and heiress of Richard, esq. of Desmond, he put an end to the long-standing quarrel between the families and united their estates. In 1632 on the death of his grandfather he succeeded him to the earldom.

He was already noted in Ireland, as had been many of his race, for his fine presence and great bodily vigour. His active career began in 1633 with the arrival of Strafford, by whom he was treated, in spite of his independence of character, with great favour. Writing to the king, Strafford described him as “young, but take it from me, a very staid head,” and Ormonde was throughout his Irish government his chief friend and support. In 1640 during Strafford’s absence he was made commander-in-chief of the forces, and in August he was appointed lieutenant-general. On the outbreak of the rebellion in 1641 he rendered admirable service in the expedition to Naas, and in the march into the Pale in 1642, though much hampered by the lords justices, who were jealous of his power and recalled him after he had succeeded in relieving Drogheda. He was publicly thanked by the English parliament and presented with a jewel of the value of £200. On the 15th of April 1642 he gained the battle of Kilrush against Lord Mountgarret. On the 30th of August he was created viscount Thurles, his education and efficacy in the administration of the state rendering him so illustrious a leader. In 1643 he was appointed lieutenant-general with a commission direct from the king. On the 18th of March 1643 he won the battle of New Ross against Thomas Preston, afterwards Viscount Tara. In September, the civil war in England having meanwhile broken out, Ormonde, in view of the successes of the rebels and the uncertain loyalty of the Scots in Ulster, concluded with the latter, in opposition to the lords justices, on the 15th of September, the “cessation” by which the greater part of Ireland was given up into the hands of the Catholic Confederation, leaving only small districts in the north and west then actually in their possession, to the English commanders. He subsequently, by the king’s orders, despatched a body of troops into England (shortly afterwards routed by Fairfax at Nantwich) and was appointed in January 1644 lord lieutenant, with special instructions to do all in his power to keep the Scotch army occupied. In the midst of all the plots and struggles of Scots, Old Irish, Catholic Irish of English race, and Protestants, and in spite of the intrigues of the pope’s nuncio as well as of attempts by the parliamentarians to ruin his power, Ormonde showed the greatest firmness and ability. He assisted Antrim in his unsuccessful expedition into Scotland. On the 28th of March 1646 he concluded a treaty with the Irish which granted religious concessions and removed various grievances. Mean-
1669 constant importunity had had its usual effect upon Charles, and on the 14th of March Ormonde was removed from the government of Ireland and from the committee for Irish affairs. He made no complaint, insisted that his sons and others over whom he had influence should retain their posts, and continued to fulfil with dignified persistence the duties of his other offices, while the greatness of his character and services was recognized by his election as chancellor of Oxford University on the 4th of August.

In 1670 an extraordinary attempt was made to assassinate the duke by a ruffian and adventurer named Thomas Blood, already notorious for an unsuccessful plot to surprise Dublin Castle in 1663, and later for stealing the royal crown from the Tower. Ormonde was attacked by this person and his accomplices while driving up St James's Street on the night of the 6th of December, dragged out of his coach, and taken on horseback along Piccadilly with the intention of hanging him at Tyburn. Ormonde, however, succeeded in overcoming the horseman to whom he was bound, and his servants coming up, he escaped. The outrage, it was suspected, had been instigated by the duke of Buckingham, who was openly accused of the crime by Lord Ormssy, Ormonde's son, in the king's presence, and threatened by him with instant death if any violence should happen to his father; and some colour was given to these suspicions by the improper action of the king in pardoning Blood, and in admitting him to his presence and treatin him with favour after his apprehension while endeavouring to steal the crown jewels.

In 1671 Ormonde successfully opposed Richard Talbot's attempt to upset the Act of Settlement. In 1673 he again visited Ireland, returned to London in 1675 to give advice to Charles on affairs in parliament, and in 1677 was again restored to favour and reappointed to the lord lieutenant. On his arrival in Ireland he occupied himself in placing the revenue and the army upon a proper footing. Upon the outbreak of the popish terror in England, he at once took the most vigorous and comprehensive steps, though with as little harshness as possible, towards rendering the Roman Catholics, who were in the proportion of 15 to 1, powerless; and the mildness and moderation of his measures served as the ground of an attack upon him in England led by Shaftesbury, from which he was defended with great spirit by his son Lord Ormssy. In 1682 Charles summoned Ormonde to court. The same year he wrote "A Letter . . . in answer to the earl of Anglesey, his Observations upon the earl of Castlehaven's Memoirs concerning the Rebellions of Ireland"; which was issued in such a grand style as to be imitated. On the 9th of November 1683 an English dukedom was conferred upon him, and in June 1684 he returned to Ireland; but he was recalled in October in consequence of fresh intrigues. Before, however, he could give up his government to Rochester, Charles II. died; and Ormonde's last act as lord lieutenant was to proclaim James II. in Dublin. Subsequently he lived in retirement at Cornbury in Oxfordshire, sent to him by Lord Clarendon, but emerged from it in 1687 to offer a firm and successful opposition at the board of the Charterhouse to James's attempt to assume the dispensing power, and force upon the institution a Roman Catholic candidate without taking the oaths according to the statutes and the act of parliament. He also refused the king his support in the question of the Indulgence; notwithstanding which James, to his credit, refused to take away his offices, and continued to hold him in respect and favour to the last.

Ormonde died on the 21st of July 1688, not having, as he rejoiced to know, "outlived his intellectuals"; and with him disappeared the greatest and grandest figure of the times. His splendid qualities were expressed with some felicity in verses written on welcoming his return to Ireland and printed in 1682:

"A Man of Plato's grand nobility,
An inbred greatness, innate honesty;
A Man not form'd of accidents, and whom
Misfortune might oppress, nor overcome . . .
Who weigs himself not by opinion
But conscience of a noble action."

He was buried in Westminster Abbey on the 1st of August.

He had, besides two daughters, three sons who grew to maturity. The eldest of these, Thomas, earl of Ossory (1634—1680) predeceased him, his eldest son succeeding as 2nd duke of Ormonde. The other two, Richard, created earl of Arran, and John, created earl of Gowran, both dying without male issue, and thus the descent of the 1st duke becoming extinct in the male line of Charles, 3rd duke of Ormonde, the earldom subsequently reverted to the descendants of Walter, 11th earl of Ormonde.

ORMONDE, JAMES BUTLER, 2ND DUKE OF (1665—1745). Irish statesman and soldier, son of Thomas, earl of Ossory, and grandson of the 1st duke, was born in Dublin on the 29th of April 1665, and was educated in France and afterwards at Christ Church, Oxford. On the death of his father in 1680 he became earl of Ossory by courtesy. He obtained command of a cavalry regiment in Ireland in 1684, and having received an appointment at court on the accession of James II., he served against the duke of Monmouth. Having succeeded his grandfather as duke of Ormonde in 1688, he joined William of Orange, by whom he was made colonel of a regiment of horse-guards, which he commanded at the battle of the Boyne. In 1691 he served on the continent under William, and after the accession of Anne he was placed in command of the land forces co-operating with Sir George Rooke in Spain. Having been made a privy councilor, Ormonde succeeded Rochester as viceroy of Ireland in 1703, a post which he held till 1707. On the dismissal of the duke of Marlborough in 1711, Ormonde was appointed captain-general in his place, and allowed himself to be made the tool of the Tory ministry, whose policy was to carry on the war in the Netherlands while giving secret orders to Ormonde to take advantage of any opportunity of entering the principal engagement. Ormonde's position as captain-general made him a personage of much importance in the crisis brought about by the death of Queen Anne. Though he had supported the revolution of 1688, he was traditionally a Tory, and Lord Bolingbroke was his political leader. During the last years of Queen Anne he almost certainly had Jacobite leanings, and corresponded with the duke of Berwick. He joined Bolingbroke and Oxford, however, in signing the proclamation of King George I., by whom he was nevertheless deprived of the captain-generalship. In June 1715 he was impeached, and fled to France, where he for some time resided with Bolingbroke, and in 1716 his immense estates were confiscated to the crown by act of parliament, though by a subsequent act his brother, Charles Butler, earl of Arran, was enabled to repurchase them. After taking part in the Jacobite invasion in 1715, Ormonde settled in Spain, where he was in favour at court and enjoyed a pension from the crown. Towards the end of his life he resided much at Avignon, where he was seen in 1733 by Lady Mary Wortley Montagu. Ormonde died on the 16th of November 1745, and was buried in Westminster Abbey.

With little of his grandfather's ability, and inferior to him in elevation of character, Ormonde was nevertheless one of the great figures of his time. Handsome, dignified, magnanimous and open-handed, and free from the meanness, treachery and venality of many of his leading contemporaries, he enjoyed a popularity which, with greater stability of purpose, might have enabled him to exercise commanding influence over events.
ORMSKIRK—ORNE

ORMSKIRK, a market town and urban district in the Ormskirk parliamentary division of Lancashire, England, 11 m. N.E. of Liverpool by the Lancashire and Yorkshire railway. Pop. (1901), 6857. The church of St Peter and St Paul is a spacious building in various styles of architecture, but principally Perpendicular. It possesses the rare feature of two western towers, the one square and embattled, the other octagonal and bearing a short spire. There are various Norman fragments, including a fine early window in the chancel. To the south-east of the church, and divided from it by a screen, is the Derby chapel, the exclusive property of the earls of Derby, whose vault is contained within. A free grammar school was founded about 1614. Rope and twine making, iron-founding and brewing are carried on, and the town has long been famous for its gingerbread.

The name and church existed in the time of Richard I., when the priory of Burscough was founded. A few fragments of this remain about 2 m. N. of Ormskirk. The prior and convent obtained from Edward I. a royal charter for a market at the manor of Ormskirk. On the dissolution of the monasteries the manor was granted to the earl of Derby.

ORNAMENT (Lat. ornare, to adorn), in decorative art, that element which adds an embellishment of beauty in detail. Ornament is in its nature accessory, and implies a thing to be ornamented, which is its active cause and by rights suggests its design (q.v.). It does not exist apart from its application. Nor is it properly added to a thing already in existence (that is but a makeshift for design), but is rather such modification of the thing in nature as may be termed by the consideration of beauty. For example, the construction and proportions of a chair are determined by use (by the necessity for combining the maximum of strength with the minimum of weight, and of fitting it to the proportions of the human body, &c.); and any modification of the plan, such as the turning of legs, the shaping of arms and back, carving, inlay, mouldings, &c.—any reconsideration even of the merely utilitarian plan from the point of view of art—has strictly to do with Ornament, which thus, far from being an afterthought, belongs to the very inception of the thing. Ornament is good only in so far as it is an indispensable part of something, helping its effect without hurting its use. It is begotten of use by the consideration of beauty. The test of ornament is its fitness. It must occupy a space, fulfill a purpose, be adapted to the material in which and the process by which it is executed. This implies treatment. The treatment befitting a vacant space does not equally cover a floor space of the same dimensions. What is suitable to hand-painting is not equally suitable to stencilling, nor what is proper to mosaic proper to carpet-weaving. Neither the purposes of decoration nor the conditions of production allow great scope for naturalism in ornament. Its forms are derived from nature, more or less; but repose is best secured by some removedness from nature—necessitated also by the due treatment of material after its kind and according to its fashioning. In the case of recurring ornament it is inept to multiply natural flowers, &c., which at every repetition lose something of their natural attraction. The artist in ornament does not imitate natural forms. Such as he may employ he transfigures. He does not necessarily set out with any idea of natural form (this comes to him by the way); his first thought is to solve a given problem in design, and he solves it perhaps most surely by means of abstract ornament—witness the work of the moderns and of the Arabs. The extremity of tasteless naturalism, reached towards the beginning of the Victorian era, was the opportunity of English reformers, prominent amongst whom was Owen Jones, whose fault was in insisting upon a form of ornament too abstract to suit English ideas. William Morris and others led the way back to nature, but to nature trained in the way of ornament.

The Styles of ornament, so-called, mark the evolution of design, being the direct outcome of Greek, Roman, Byzantine, Gothic or other conditions, in days when fashion moved slowly. Post-Renaissance ornament goes by the name of the reigning king; but the character of the historic periods was not sought by artists; it came of their working in the way natural to them and doing their best. “Style,” as distinguished from “the Styles,” comes of an artist’s intelligent and sympathetic treatment of his material, and of his personal sincerity and strength. International traffic has gone far to do away with national characteristics in ornament, which becomes yearly more and more alike all the world over. The subsidiary nature of ornament and its subjection to conditions lead to its frequent repetition, which results in pattern, repeated forms falling inevitably into lines, always self-asserting, and liable to annoy in proportion as they were not foreseen by the designer. He cannot, therefore, safely establish them. Indeed, his first business is to build pattern upon lines, if not intrinsically beautiful, at least helpful to the scheme of decoration. He may disguise them; but capable designers are generally quite frank about the construction of their pattern, and not afraid of pronounced lines. Of course, adaptation being all-essential to pattern, an artist must be versed in the technique of any manufacture for which he designs. His art is in being equal to the occasion. (L. F. D.)

ORNE, a department of the north-west of France, about half of which formerly belonged to the province of Normandy and the rest to the duchy of Alençon and to Perche. Pop. (1906) 315,993. Area, 2,571 sq. m. It is bounded N. by Calvados, N.E. by Eure and S.E. by Eure-et-Loir, S. by Sarthe and Manche, and W. by Manche. Geologically there are two distinct regions: to the west of the Orne and the railway from Argentan to Alençon lie primitive rocks connected with those of Brittany; to the east begin the Jurassic and Cretaceous formations of Normandy. The latter district is agriculturally the richest part of the department; in the former the poverty of the soil has led the inhabitants to seek their subsistence from industrial pursuits. Between the northern portions, draining to the Channel, and the southern portion, belonging to the basin of the Loire, stretch the hills of Perche and Normandy, which generally have a height of from 800 to 1000 ft. The highest point in the department, situated in the forest of Écouves north of Alençon, reaches 1368 ft. The department gives birth to three Seine tributaries—the Eure, its affluent the Iton, and the Risle, which passes by Laigle. The Touques, passing by Vimoutiers, the Dives and the Orne fall into the English Channel, the last passing Sées and Argentan, and receiving the Noiron with its tributary the Vère, which runs past Flers. Towards the Loire flows the Huisne, a feeder of the Sarthe passing by Mortagne, the Sarthe, which passes by Alençon and the Mayenne, some of whose affluents rise to the north of the dividing range and make their way through it by the most picturesque defiles. The department, indeed, with its beautiful forests containing oaks several centuries old, its meadows, streams, deep gorges and stupendous rocks, is one of the most picturesque of all France. In the matter of climate Orne belongs to the Seine region. The mean temperature is 50 F.; the summer heat is never extreme; the west winds are the most frequent; the rainfall, distributed over about a hundred days in the year, amounts to 36 in. or about 5 in. more than the average for France.

Horse-breeding is the most flourishing business in the rural districts; there are three breeds—those of Perche, Le Merlerault and Brittany. The great government stud of Le Pin-au-Haras (established in 1744) with its school of horse-breeding, is situated between Le Merlerault and Argentan. Several horse-training establishments exist in the department. A large number of lean cattle are bought in the neighbouring departments to be fattened; the farms in the vicinity of Vimoutiers, on the borders of Calvados, produce the famous Camembert cheese, and others excellent butter. The bee industry is very flourishing. Oats, wheat, barley and buckwheat are the chief cereals, besides which fodder in great quantity and variety, potatoes and some

298
hemp are grown. The variety of production is due to the great natural diversity of the soils. Small farms are the rule, and the fields in those cases are surrounded by hedges relieved by pollard trees. Along the roads or in the enclosures are planted numerous pear and apple trees, the latter yielding cider, part of which is manufactured into brandy. Beech, oak, birch and pine are the chief timber trees in the extensive forests of the department. Orne has iron mines and freestone quarries; a kind of smoky quartz known as Alençon diamond is found. Its most celebrated mineral waters are those of the hot springs of Bagnoles, which contain salt, sulphur and arsenic, and are employed for tonic and restorative purposes in cases of general debility. In the forest of Bellême is the chalybeate spring of La Hesse, which was used by the Romans.

Cotton and linen weaving, principally carried on at Flers (q.v.) and La Ferté-Macé (pop. 4355), forms the staple industry of Orne. Alençon and Vimoutiers are engaged in the production of linen and cotton. Vimoutiers has bleachers, which, together with dye-works, are found in the textile centres. Only a few workmen are now employed at Alençon in the making of the lace which takes its name from the town. Foundries and wire-works also exist in the department, and articles in copper, zinc and lead are manufactured. Pins, needles, wire and hardware are produced at Laigle (pop. 4416), and Tinchebray is also a centre for hardware manufacture. There are also glass-works, paper-mills, tanneries (the waters of the Orne being reputed to give a special quality to the leather) and glove-works. Coal, raw cotton, metals and machinery are imported into the department, which exports its woven and metal manufacture, live stock and farm produce.

The department is served by the Western railway. There are four arrondissements, with Alençon, the capital, Argentan, Domfront and Mortagne as their chief towns, 36 cantons and 132 communes. The department forms the diocese of Séres (province of Rouen) and part of the académie (educational division) of Caen, and the region of the IV. army corps; its court of appeal is at Caen. The chief places are Alençon, Argentan, Mortagne, Flers and Séres. Carrouges has remains of a château of the 15th and 17th centuries; Chambois has a donjon of the 12th century; and there is a fine Renaissance château at O. A church in Laigle has a fine tower of the 15th century. There are a great number of megalithic monuments in the department.

ORNITHOLOGY, properly the methodical study and consequent knowledge of birds with all that relates to them; but the difficulty of assigning a limit to the commencement of such study and knowledge gives the word a very vague meaning, and practically procures its application to much that does not enter the domain of science. This elastic application renders it impossible to give the following sketch of the history of ornithology to draw any sharp distinction between works that are emphatically ornithological and those to which that title can only be attached by courtesy; for, since birds have always attracted far greater attention than any other group of animals with which in number or in importance they can be compared, there has grown up concerning them a literature of corresponding magnitude and of the widest range, extending from the recondite and laborious investigations of the morphologist and anatomist to the casual observations of the sportsman or the schoolboy.

Though birds make a not unimportant appearance in the earliest written records of the human race, the painter's brush has preserved their counterfeit presentment for a still longer period. A fragmentary fresco taken from a tomb at Medum was deposited some years ago, though in a decaying condition, in the Museum of Egyptian Antiquities, Cairo. This Egyptian painting, if it may be dated from the time of the third or fourth dynasty, some three thousand years before the Christian era. In it were depicted with a marvellous fidelity, and thorough appreciation of form and colouring (despite a certain conventional treatment), the figures of six geese. Four of these figures can be unhesitatingly referred to two species (Anser albitrons and A. ruficollis) well known at the present day. In later ages the representations of birds of one sort or another in Egyptian paintings and sculptures become countless, and the bassi-relièves of Assyrian monuments, though mostly belonging of course to a subsequent period, are not without them. No figures of birds, however, seem yet to have been found on the incised stones, bones or ivories of the prehistoric races of Europe.

History of Ornithology to End of 18th Century.

Aristotle was the first serious author on ornithology with whose writings we are acquainted, but even he had, as he tells us, predecessors; and, looking to that portion of his work which animals of 16th century we shall meet with finds that, though more than 170 sorts of birds are mentioned, yet what is said of them amounts on the whole to very little; and this consists more of desultory observations in illustration of his general remarks (which are to a considerable extent physiological or bearing on the subject of reproduction) than of an attempt at a connected account of birds. One of his commentators, C. J. Sundevall—equally proficient in as in ornithological knowledge—was, in 1863, compelled to leave more than a score of the birds of which Aristotle wrote unidentified. Next in order of date, though at a long interval, comes Pliny the Elder, in whose "Historia Naturalis Book X. is devoted to birds. Neither Aristotle nor Pliny attempted to classify the birds known to them beyond a very rough and for the most part obscure grouping. Aristotle seems to recognize eight principal groups: (1) Gampsowyches, approximately equivalent to the numerous observations on the (2) Scœleophaga, containing most of what would now be called "Ochines, excepting indeed the (3) Acanthophaga, composed of the goldfinch, siskin and a few others; (4) Sceniphaga, the woodpeckers; (5) Peristerode, or pigeons; (6) Sêchepoda, (7) Steganopoda, and (8) Barca, nearly the same respectively as the Linnaean Grallae, Anseres and Gallinæ. Pliny, relying wholly on characters taken from the feet, limits himself to three groups—without assigning names to them—those which have "hooked tallons, as Hawkes; or round long claws, as Hennes; or else they be broad, flat, and whole-foot, as Geese and all the sort in manner of water-foule"—to use the words of Philemon Holland, who, in 1601, published a quaint and, though condensed, yet fairly faithful English translation of Pliny's work.

About a century later came Aelian, who died about a.d. 140, and compiled in Greek (though he was an Italian by birth) a number of miscellaneous observations respecting a great number of animals. His work is a kind of commonplace book kept without scientific discrimination. A considerable number of birds are mentioned, and something said of almost each of them; but that something is too often nonsense according to modern ideas. The twenty-six books De Animalibus of Albertus Magnus (Groot), printed in 1478, are founded mainly on Aristotle. The twenty-third of these books is De Avibus, and therein a great number of birds' names make their earliest appearance, few of which are without interest from a philologist's if not an ornithologist's point of view, but there is much difficulty in recognizing the species to which many of them belong. In 1485 was printed the first dated copy of the volume known as the "Orlus sanitatis, to the popularity of which many editions testify. Though said by its author, Johann Wonnecke von Caub (Latinized as Johannes de Cuba), to have been composed from a study of the

2 This is Sundevall's estimate; Drs Aubert and Wimmer in their excellent edition of the "Ologyma prœfàw (Leipzig, 1868) limit the number of species to 170.

3 Absurd as much that we find both in Albertus Magnus and the Orus seems to modern eyes, if we go a step lower in the scale and consult the "Bestiaries" or treatises on animals which were common from the 12th to the 14th century we shall meet with many more absurdities. See for instance that by Philippe de Thaun (Philippus Taenensis), dedicated to Adelaide or Alice, queen of Henry I. of England, and probably written soon after 1211, as printed by the late Mr Thomas Wright, in his Popular Treatises on Science written during the Middle Ages (London, 1841).
collections formed by a certain nobleman who had travelled in Eastern Europe, Western Asia and Egypt—possibly Breidenbach, an advocate of whose views on the Levant was printed in 1846; it is really a medical treatise, and its zoological portion is mainly an abbreviation of the writings of Albertus Magnus, with a few interpolations from Isidorus of Seville (who flourished in the beginning of the 7th century, and was the author of many works highly esteemed in the middle ages) and a work known as Physiologus (q.v.). The third tractatus of this volume deals with birds—including among them bats, bees and other flying creatures; but as it is the first printed book in which figures of birds are introduced it merits notice, though most of the illustrations, which are rude woodcuts, fail, even in the coloured copies, to give any precise indication of the species intended to be represented.

The revival of learning was at hand, and William Turner, a Northumbrian, while residing abroad to avoid persecution at home, printed at Cologne in 1544 the first commentary on the birds mentioned by Aristotle and Pliny conceived in anything like the spirit that moves modern naturalists. In the same year and from the same press was issued a Dialogus de Avibus by Gervyat Longolus, and in 1570 Calus brought out in London his treatise De Territorialibus Historiae Animalium. In this work, small though it be, ornithology has a good share; and all three may still be consulted with interest and advantage by its votaries. Meanwhile the study received a great impulse from the appearance, at Zurich in 1555, of the third book of Conrad Gesner's Historia Animalium 'qui est de Avium natura,' and at Paris in the same year of Pierre Belon's (Bellonius) Histoire de la nature des Oiseaux. Gesner brought an amount of erudition, hitherto unequalled, to bear upon his subject; and, making due allowance for the times in which he wrote, his judgment must in most respects be deemed excellent. In his work, however, there is little that can be called systematic treatment. Like nearly all his predecessors since Aelian, he adopted an alphabetical arrangement, though this was not too pedantically preserved, and did not hinder him from placing together the kinds of birds which he supposed (and generally supposed rightly) to have the most resemblance to that one whose name, being best known, was chosen for the headpiece (as it were) of his particular theme, thus recognizing to some extent the principle of classification.

Belon, with perhaps less learned in his time, but more learned in his own, had more practical knowledge of birds—those internal as well as external structure. Hence his work, written in French, contains a far greater amount of original matter; and his personal observations made in many countries, from England to Egypt, enabled him to avoid most of the puerilities which disfigure other works of his own or of a preceding age. Besides this, Belon disposed the birds known to him according to a definite system, which (rude as we now know it to be) formed a foundation on which several of his successors were content to build, and even to this day traces of its influence may still be discerned in the arrangement followed by writers who have faintly appreciated the principles on which modern taxonomists rest the outline of their schemes. Both his work and that of Gesner were illustrated with woodcuts, many of which display much spirit and regard to accuracy.

Belon, as has just been said, had a knowledge of the anatomy of birds, and he seems to have been the first to institute a direct comparison of their skeleton with that of man; but in this respect he was only prefigured by a few years the more precise researches of Volcher Coiter, a Frisian, who in 1575 and again published at Nuremberg two treatises, in one of which the internal structure of birds in general is very creditably described, while in the other the osteology and myology of certain forms is given in considerable detail, and illustrated by carefully drawn figures. The first is entitled Externarum et internarum principaliium humani corporis Tabulae, &c., and the second, which is the most valuable, is merely appended to the Lectureis Gabrielis Fallepii de partibus similaribus humani corporis, &c., and thus the scope of each work being regarded as medical, the author's labours were wholly overlooked by the mere natural-historians who followed, though Coiter introduced a table, "De differentis Avium," furnishing a key to a rough classification of such birds as were known to him, and this as nearly the first attempt of the kind deserves notice here.

Contemporary with these three men was Ulysses Aldrovandus, a Bolognese, who wrote a Historia Naturalium in sixteen volumes, most of which were not printed till after his death in 1605; but those on birds appeared between 1590 and 1600. Aldrovandus' work is admirably a compilation, and that not of the most dissipative kind. While a peculiar kind of Gesner is continuously displayed, though his statements are very constantly quoted—nearly always as those of "Ornithologus," his name appearing but few times in the text, and not at all in the list of authors cited. With certain modifications in principle not very important, but characterized by much more elaborate detail, Aldrovandus adopted Belon's method of arrangement, but in a few respects there is a manifest retrogression. The work of Aldrovandus was illustrated by copper-plates, but none of his figures approach those of his immediate predecessors in character or accuracy. Nevertheless the book was eagerly sought, and several editions of it appeared.

Mention must be made of a medical treatise by Caspar Schwenckfeld, published at Liegnitz in 1603, under the title of Therioretum Silesiae, the fourth book of which consists of an "Avarium Silesiae," and is the earliest of the works we now know by the name of fauna. The author was well acquainted with the labours of his predecessors, as his list of over one hundred of them testifies. Of the birds of which he describes a classification the accuracy sufficient to enable them to be identified, and his observations upon them have still some interest; but he was innocent of any methodical system, and was not exempt from most of the professional fallacies of his time.

Hiorto, from the nature of the case, the works aforesaid treated of scarcely any but the birds belonging to the orbis veterinus notus; but the geographical discoveries of the 16th century began to bear fruit, and many animals of kinds unsuspected were, about one hundred years later, made known. Here there is only space to name Bontius, Clusius, Hernandez (or Fernandez), Margrave, Niederberg and Piso, whose several works describing the natural products of both the Indies—whether the result of their own observation or compilation—together with those of Oliva and Worm, produced a marked effect, since they led up to what may be deemed the foundation of scientific ornithology.

The Historia Naturalis of Johannes Johnstonus, said to be of Scottish descent but by birth a Pole, ran through several editions during the 17th century, but is little more than an epitome of the work of Aldrovandus.

The Histeroicon of Bohart—a treatise on the animals named in Holm-Writ—was published in 1619.

For Liebigin's determination of the birds described by Margrave and Piso see the Abhandlungen of the Berlin Academy for 1817 (pp. 155 seq.).

The earliest list of British birds seems to be that in the Pinax Rerum Usitatis of Christopher Merrett, published in 1677. In the following year appeared the Onomasticon Zoologicum of Walter Charleton, which contains some information on ornithology. An enlarged edition of the latter, under the title of Exercitationes, &c., was published in 1677; but neither of these writers is of much authority. In 1684 Sibbald in his Scotia illustrata published the earliest Fauna of Scotland.
This foundation was laid by the joint labours of Francis Willughby (1635–1672) and John Ray (1628–1705), for it is impossible to separate their share of work in natural history more than to say that, while the former more eagerly lilly devoted himself to zoology, botany was the favourite pursuit of the latter. Together they studied, together they travelled and together they collected. Willughby, the younger of the two, and at first the other's pupil, seems to have gradually become the master; but, he dying before the promise of his life was fulfilled, his writings were given to the world by his friend Ray, who, adding to them from his own stores, published the Ornithologia in Latin in 1676, and in English with many emendations in 1678. In this work birds generally were grouped in two great divisions—"land-fowl" and "water-fowl"—the former being subdivided into those which have a croaked beak and talons, and those which have a straighter bill and claws, while the latter was separated into those which frequent waters and watery places, and those that swim in the water—each subdivision being further broken up into many sections, to the whole of which a key was given. Thus it became possible for almost any diligent reader without much chance of error to refer to its "fossil Register" and learn the names of the birds of any region to which it was applied. This interest in ornithology continued, and in 1736 he completed a Synopsis Methodica Avium, which, through the fault of the booksellers to whom it was entrusted, was not published till 1713, when Derham gave it to the world.1

Two years after Ray's death, Linnaeus, the great reformer of natural history, was born, and in 1735 appeared the first edition of the celebrated Systema Naturae. Successive editions of this work were produced under its author's supervision in 1740, 1748, 1758 and 1766. Impressed by the belief that verbosity was the bane of science, he carried terseness to an extreme which frequently created obscurity, and this in no branch of zoology more than in that which relates to birds. Still the practice introduced by him of assigning to each species a diagnosis by which it ought in theory to be distinguishable from any other known species, and of naming it by two words—the first being the generic and the second the specific term, was so manifest an improvement upon anything which had previously obtained that the Linnaean method of differentiation and nomenclature established itself before long in spite of all opposition, and in principle became almost universally adopted. In his classification of birds Linnaeus for the most part followed Ray, and where he departed from his model he seldom improved upon it.

In 1745 P. Barrère brought out at Perpignan a little book called Ornithologiae Specimen novum, and in 1752 Möhring published at Aurich one still smaller, his Avium Genera. Both these works (now rare) are manifestly framed on the Linnaean method, so far as it had then reached; but in their arrangement of the various forms of birds they differed greatly from that which they designed to supplant, and they deservedly obtained little success. Yet as systematists their authors were no worse than Klein, whose Historiae Avium Prodromus, appearing at Linbeck in 1750, and Stemmata Avium at Leipzig in 1755, met with considerable favour in some quarters. The chief merit of the latter work lies in its forty plates, wherein the heads and feet of a hundred different birds are grouped together.

But, while the successive editions of Linnaeus's great work were revolutionizing natural history, and his example of precision in language producing excellent effect on scientific writers, several other authors were advancing the study of ornithology in a very different way—a way that pleased the eye even more than his labours were pleasing the mind. Between 1731 and 1743 Mark Catesby brought out in London his Natural History of Carolina—two large folios containing highly coloured plates of the birds of that colony, Florida and the Bahamas.4 Eleazar Albin between 1738 and 1740 produced a Natural History of Birds in three volumes of more modest dimensions; but he seems to have been ignorant of ornithology, and his coloured plates are greatly inferior to Catesby's. Far better both as draughtsman and as authority was George Edwards, who, in 1743 began, under the same title as Albin, a series of plates with letterpress, which was continued by the name of Geographia in Natural History, and finished in 1760, when it had reached seven parts, forming four quarto volumes, the figures of which are nearly always quoted with approval.5

The year which saw the works of Edwards completed was still further distinguished by the appearance in France, where little had been done since Belon's days,6 in six quarto volumes, of the Ornithologie of Mathurin Jacques Brisson—a work of very great merit so far as it goes, for as a descriptive ornithologist the author stands even now unsurpassed; but it must be said that his knowledge, according to internal evidence, was confined to the skins and to the external parts of birds' skins. It was enough for him to give a schematic and perhaps exact description of the specimens as came under his eye, distinguishing these by prefixing two asterisks to their name, using a single asterisk where he had only seen a part of the bird, and leaving unmarked those that he described from other authors. His attempt at classification was certainly better than that of Linnaeus; and it is rather curious that the researches of the latest ornithologists point to results in some degree comparable with Brisson's systematic arrangement, for they refuse to keep the birds-of-prey at the head of the Class Aves, and they require the establishment of a much larger number of "Orders" than for a long while was thought advisable. Of such "Orders" Brisson had twenty-six and he gave pigeons and poultry precedence of the birds which are plunderers and scavengers. But greater value lies in his generic or sub-generic divisions, which, taken as a whole, are far more natural than those of Linnaeus, and consequently capable of better diagnosis. More than this, he seems to be the earnest ornithologist, perhaps the earliest zoologist, to conceive the idea of each genus possessing what is now called a "type"—though such a term does not occur in his work; and, in like manner, without declaring it in so many words, he indicated unmistakably the existence of subgenera—all this being effected by the skilful use of names. Unfortunately he was too soon in the field to avail himself, even had he been so minded, of the convenient mode of nomenclature brought into use by Linnaeus. Immediately on the completion of his Regne Animalc in 1756, Brisson set about his Ornithologie, and it is only in the last two volumes of the latter that any reference is made to the tenth edition of the Systema Naturae, in which the binomial method was introduced. It is certain that the first four volumes were written if not printed before that method was promulgated, and when the name of Linnaeus as a zoologist rested on little more than the very meagre sixth edition of the Systema Naturae and the first edition of his Fauna Suecica. Brisson has been charged with jealousy of, if not hostility to, the great Swede, and it is true that in the preface to his Ornithologie he complains of the insufficiency of the Linnaean characterizations, but, when one considers how much better acquainted with birds the Frenchman was, such criticism must be allowed to be pardonable if not wholly just. Brisson's work was in French, with a parallel translation (edited, it is said, by Pallas) in Latin, which last was reprinted separately at Leiden three years afterwards.

1 To this was added a supplement by Petiver on the Birds of Madraer, taken from his general information sent him by Edward Buckley of Fort St George, being the first attempt to catalogue the birds of any part of the British possessions in India.

2 After Klein's death his Prodromus, written in Latin, had the unwonted fortune of two distinct translations into German, published in the same year 1760, the one at Leipzig and Lübeck by Behn, the other at Danzig by Reyger—each of whom added more or less to the original.

3 Several birds from Jamaica were figured in Sloane's Voyage, &c. (1705–1725), and a good many exotic species in the Theasurus, &c., of Edwards (1734–1749), without their faulty execution these plates had little effect upon Ornithology.

4 The works of Catesby and Edwards were afterwards reproduced at Nuremberg and Amsterdam by Seligmann, with the letterpress in German, French and Dutch.

5 Birds were treated of in a worthless fashion by one D. B. in a Dictionnaire raisonné et universel des animaux, published at Paris in 1759.
In 1767 there was issued at Paris a book entitled *L'Histoire naturelle éclairée dans une de ses parties principales, l'ornithologie*. This was the work of Salerne, published after his death, and it is represented of as being a mere translation of Ray's *Synopsis*, but a vast amount of fresh matter, and mostly of good quality, is added.

The success of Edwards's very respectable work seems to have provoked competition, and in 1765, at the instigation of Buffon, the younger d'Aubenton began the publication known as the *Planches enluminées d'histoire naturelle*, which appearing in forty-two parts was not completed till 1780, when the plates it contained reached the number of 1008—all coloured, as its title intimates, and nearly all representing birds. This enormous work was subsidized by the French government; and, though the figures are utterly devoid of artistic merit, they display the species they are intended to depict with sufficient approach to fidelity to ensure recognition in most cases without fear of error, which in the absence of any text is no small praise. But Buffon was not content with merely causing to be published this unparalleled set of plates. He seems to have regarded the work just named as a necessary precursor to his own labours in ornithology. His *Histoire naturelle, générale et particulière*, was begun in 1749, and in 1770 he brought out, with the assistance of more than a hundred authors, a love-work of nearly 1600 large pages of the great *Histoire naturelle des oiseaux*. Buffon was the first man who formed any theory that may be called reasonable of the geographical distribution of animals. He proclaimed the variability of species in opposition to the views of Linnaeus as to their fixity, and moreover supposed that this variability arose in part by degradation. Taking his labours as a whole, there cannot be a doubt that he enormously enlarged the purview of naturalists, and, even if limited to birds, that, on the completion of his work upon them in 1785, ornithology stood in a very different position from that which it had before occupied.

Great as were the services of Buffon to ornithology in one direction, those of a wholly different kind rendered by John Latham. Latham must not be overlooked. In 1781 he began a work the practical utility of which was immediately recognized. This was his *General Synopsis of Birds*, and, though formed generally on the model of Linnaeus, greatly diverged in some respects therefrom. The classification was modified, chiefly on the old lines of Willughby and Ray, and certainly for the better; but no scientific nomenclature was introduced which, however, I think, would have been a change for the worse. His scope was co-extensive with that of Brisson, but Latham did not possess the inborn faculty of picking out the characteristic wherein one species differs from another. His opportunities of becoming acquainted with birds were hardly inferior to Brisson's, for during Latham's long lifetime there poured in upon him countless new discoveries from all parts of the world, but especially from the newly-explored shores of Australia and the islands of the Pacific Ocean. The British Museum had been formed, and he had access to everything it contained in addition to the abundant materials afforded him by the private museum of Sir Ashton Lever. Latham entered, so far as the limits of his work would allow, into the history of the birds he described, and this with evident zest whereby he differed from his French predecessor; but the number of classified in his *Synopsis* was perhaps too great, for the description of his species must be very great, and not unfrequently the same species is described more than once. His *Synopsis* was finished in 1785; two supplements were added in 1787 and 1802, and in 1790 he produced an abstract of the work under the title of *Index Ornithologicus*, wherein he assigned names on the Linnaean method to all the species described. Not to recur again to his labours, it may be said here that between 1821 and 1828 he published at Winchester, in eleven volumes, an enlarged edition of his original work, entitling it *A General History of Birds*; but his defects as a compiler, which had been manifest before, rather increased with age, and the consequences were not happy.

About the time that Buffon was bringing to an end his studies of birds, Mauduyt undertook to write the *Ornithologie of the Encyclopédie méthodique*—a comparatively easy task, considering the recent works of his fellow-countrymen on that subject, and finished in 1784. Here it requires no further comment, especially as a new edition was called for in 1790, the ornithological parts of which were begun by Bonnaterre, who, in 1790 died, and thereupon only finished three hundred pages of it when he lost his life in the French Revolution; and the work thus arrested was continued by Vieillot under the slightly changed title of *Tableau encyclopédique et méthodique des trois règnes de la Nature*—the Ornithologie forming volumes four to seven, and not completed till 1823. In the former edition Mauduyt had taken the subjects alphabetically; but here they are disposed according to an arrangement, with some few modifications, furnished by d'Aubenton, which is extremely shallow and unworthy of consideration. Several other works bearing upon ornithology in general, but of less importance than most of those just named, belong to this period. Among others may be mentioned the *Ornithologie* of Thomas Pennant, first printed at Edinburgh in 1773, but best known by the edition which appeared in London in 1781; the *Elementa Ornithologica* and *Museum Ornithologicum* of Schäffer, published at Ratisbon in 1774 and 1784 respectively; Peter Brown's *New Illustrations of Zoology* in London in 1776; Hermann's *Tabulae Affinitatum Animalium* at Strasburg in 1783, followed posthumously in 1804 by his *Observationes Zoologicae*; Jacquin's *Beiträge zur Geschichte der Voelge* in Vienna in 1784, and in 1790 at the same place; and by the latter the title *Geschichte der Vogel*. Sparrman's *Museo Carolinianum* at Stockholm from 1786 to 1789; and in 1794 Hayes's *Portraits of rare and curious Birds* from the menagerie of Child the banker at Osterley near London. The same draughtsman executed, in his *Histoire de la Manche* (1822) another series of figures of rare and curious Birds.

The practice of Brisson, Buffon, Latham and others of neglecting to name after the Linnaean fashion the species they described gave great encouragement to compilation, and led to what has proved to be of some inconvenience to modern ornithologists. In 1773 P. L. S. Müller brought out at Nuremberg a German translation of the *Systema Naturae*, completing it in 1776 by a Supplement containing a list of animals thus described, which had hitherto been technically anonymous, with diagnoses and names on the Linnaean model. In 1783 Boddart printed at Utrecht a Table des planches enluminées, in which he attempted to refer every species of bird figured in that extensive series to its proper Linnaean genus, and 30 volumes of its Supplement to the *Systema Naturae*. Another in a like manner in 1786, Scopli—already the author of a little book published at Leipzig in 1769 under the title of *Annus I. Histoire-naturalis*, in which are described many birds, mostly from his

---

1 They were drawn and engraved by Martiner, who himself began in 1787 a *Histoire des oiseaux* with small coloured plates which have some merit, but the text is worthless.

2 Between 1767 and 1776 there appeared at Florence a *Storia Naturale degli Uccelli*, in five folio volumes, containing a number of ill-drawn and ill-coloured figures from the collection of Giovanni Gerini, an ardent collector who died in 1751, and therefore must be acquitted of any part in the production of it. Though a large volume but unimportant, it is that of certain learned men who did not happen to be ornithologists (cf. Savi, *Ornithologia Toscan*. i. Introduzione, p. v.);

3 He retired on the completion of the sixth volume, and thereupon Buffon associated Bexon with himself.

5 In 1792 Shaw began the *Museum Leverianum* in illustration of this collection, which was finally disposed of, and what is known to remain of it found its way to Vienna. Of the specimens in the British Museum described by Latham it is to be feared that scarcely any exist. They were probably very imperfectly prepared.

6 A German translation by Beachstein subsequently appeared.

7 He also prepared for publication a second edition of his *Index Ornithologicus*, but this was never printed, and the manuscript came into A. Newton's possession.

8 The work was entitled *Voorstionum Naturae*, in English and Latin, of Shaw and Noddler, the former being the author, the latter the draughtsman and engraver, was begun in 1789 and carried on till Shaw's death, forming twenty-four volumes. It contains a name for every species, but the plates were never engraved, and a sequel, *The Zoological Miscellanea* was begun by Leech, Noddler continuing to do the plates. This was completed in 1817, and forms three volumes with 149 plates, 27 of which represent birds.

9 Of this work only fifty copies were printed, and it is one of the rarest known to the ornithologist. Only two copies are believed to exist in England, one in the British Museum, the other in private hands. It was reprinted in 1874 by Mr Tegteimer.
own collection or the Imperial vivarium at Vienna—was at the pains to print at Pavia in his miscellaneous Delicæa Florae et Faunæ Insulærum a Specimen Zoologicum containing diagnoses, duly named, of the birds discovered and described by Sonnerat in his Voyage aux Indes et aux Îles du Sud, which was published at Paris in 1772 and 1776. But the most striking example of compilation was that exhibited by J. F. Gmelin, who in 1788 commenced what he called the Thirteenth Edition of the celebrated Systema Naturæ, which obtained the title of Ornithology. In this work the familiarity of the original, the additions of this editor have been very frequently quoted, even by expert naturalists, as though they were the work of the author himself. Gmelin availed himself of every published book on ornithology, and with much labour labours of Latham, nearly condensing his English descriptions into Latin diagnoses, and bestowing on them binomials. Hence it is that Gmelin appears as the authority for so much of the nomenclature of birds. In his Voyages de La Perouse and Voyage à la Nouvelle Zelande, his work, but left the classification, at least of the birds, as it was—a few new genera excepted. During all this time little had been done in studying the internal structure of birds; but the foundations of the science of anatomy had been laid by the investigations into the development of the chick by the great Harvey. Between 1666 and 1669 Pernaut edited at Paris eight accounts of the dissection by du Verney of as many species of birds, which, translated into English, were published in London by Wallis as the first volume of the The Natural History of Animals. After the death of the two naturalists just named, another series of similar descriptions of eight other species was found among their papers, and the whole were published in the Memoirs of the Academy of Sciences in 1776. But in 1818 Gerard Blasius had brought out at Amsterdam a Anatomie Animalium, containing the results of all the dissections of animals that he could find; and the second part of this book, treating of birds, makes a respectable show of more than one hundred and twenty closely-printed quarto pages, though nearly two-thirds is devoted to a Treatise De Ovo et Pullo, containing among other things a reprint of Harvey's researches, and the scientific value of the book may be inferred from the fact that the last edition of it was not published till 1882. In the 18th century, though highly meritorious, were not connected as a whole, and it is plain that no conception of what it was in the power of Comparative Anatomy to set forth had occurred to the most diligent dissectionists. For this purpose remained reserved for Georges Cuvier, who in 1798 published at Paris his Tableau élémentaire de l'histoire naturelle des animaux, to lay the foundation of a thoroughly hitherto unknown mode of appreciating the value of the various groups of the animal kingdom. Yet his first attempt was a mere sketch. Though he made a perceptible advance on the classification of Linnaeus, at that time predominant, it is now easy to see in how many ways—want of sufficient material being no doubt one of the chief—Cuvier failed to produce a really natural arrangement. His principles, however, are those which must still guide taxonomists, notwithstanding that they have in so great a degree overthrown the entire scheme which he propounded. Confining our attention here to ornithology, Cuvier's arrangement of the class Aves is now seen to be not very much better than any which it superseded. But this view is gained by following the methods which Cuvier taught. In the work just mentioned few details are given of the birds themselves, and more respectable classification of birds contained in his Leçons d'anatomie comparée of 1805 is based wholly on external characters, as such had been used by nearly all his predecessors; and the Règne Animal of 1817, when he was in his fullest vigour, afforded not the least evidence that he had ever dissected a couple even of birds with the object of determining their relation to each other in his Leçons, which then, as before, depended wholly on the configuration of his bills and feet. But, though apparently without such a knowledge of the anatomy of birds as would enable him to apply it to the formation of that natural system which he was fully aware had yet to be sought, he seems to have been an excellent judge of the characters afforded by the bill and limbs, and the use he made of them, coupled with the extraordinary reputation he acquired on other grounds, procured for his system the adhesion for many years of the majority of ornithologists. Hitherto mention has chiefly been made of works on general ornithology, but it will be understood that these were largely aided by the enterprise of travellers, and as there were many of them who published their narratives in separate forms their contributions have been better recovered than those of Cupido and Latham, which then were especially noted. Sarsigili, the fifth volume of whose Danubius Pannonico-Mysicus is devoted to the birds he met with in the valley of the Danube, and appeared at the Hague in 1726, followed by a further work of the same sort. Many of these contributions, though nearly all that are of much value, were not generally accessible till twenty years later. Of still wider interest are the accounts of Cook's three famous voyages, though unhappily much of the information gained by the naturalists who accompanied him has been lost: the original observations of the elder Forster were not printed till 1844, and the valuable collection of zoological drawings made by the younger Forster still remains unpublished in the British Museum. The works of Swainson, Tourte, and others of the colonization of New South Wales at the end of the last century ought not to be overlooked by any Australian ornithologist. The only information at this period on the ornithology of South America is contained in the two works on Chile by Molina, published at Bologna in 1776 and 1782. The travels of Der Vaillant in South Africa having been completed in 1785, his great Oiseaux d'Afrique began to appear in Paris in 1797; but it is hard to speak properly of this work, for several of the species in it are not only not of the habits of the country, though he sometimes gives a local account of the circumstances under which he observed them. From travellers who employ themselves in collecting the animals of foreign countries, comparative zoological work at home and study those of their own district, be it great or small, are really not so much divided as at first might appear. Both may well be named Faunists, and of the latter there were not a few who having trained their attention more or less to ornithology should here be

---

6 So little regard did he pay to the osteology of birds that, according to the Blainville (Jour. de Physique, xii. p. 137, nol), the skeleton of a fowl to which was attached the head of a hornbill was for a long time exhibited in the Museum of Comparative Anatomy at Paris! Yet, in order to determine the difference of structure in the foot of birds belonging to different families, he must have dissected more than one hundred and fifty species of birds. Unfortunately for him, and as will appear in the sequel, it seems not to have occurred to him to use any of the results he obtained as the basis of a classification.

7 It is unnecessary to enumerate the various editions of the Règne Animal. Of the English translations, that edited by Griffiths and Fidgeon is the most complete. The ornithological portion of it is given in these works, received many additions from John Edward Gray, and appeared in 1829.

8 Though much later in date, the Tier per Posegamam Scalavone of Piller and Mitterpacher, published at Buda in 1783, may perhaps be the most convenient work.

9 The results of Forskal's travels in the Levant, published after his death by Niebuhr, require mention, but the ornithology they contain is but scant.

10 It has been charitably suggested that, his collection and notes have not been overlooked, he was induced to supply the latter from his memory and the former by the nearest approach to his lost specimens that he could obtain. This explanation, poor as it is, falls, however, in regard to some species.
mentioned, and first among them Rzaczynski, who in 1721 brought out and Sandomirski the Historia naturalis curiosa regni Poloniae, to which an Auctarium was posthumously published at Danzig in 1743. This also may be perhaps the most proper place to notice the Historia in albo Hungariae of Grossinger, published at Pozen in 1793. In 1734 J. L. Frisch began the long series of works on the birds of Germany with which the literature of ornithology is enriched, by his Vorstellung der Vögel Teutschlands, which was only completed in 1763, and, its coloured plates proving very attractive, was reissued in 1788, in the latter year being begun in that country for it is scarcely more—on the birds of the Hercynian Forest made its appearance at Pappenheim in 1745. In 1756 Kramer published at Vienna a modest Epochen of the plants and animals of Lower Austria, a work which has never been reprinted, but is of interest as showing the far more logical order of arrangement, and the very different tendency of the birds of the province of Anhalt, which on its completion in 1804 was found to have swollen into an ornithology of northern Germany and the neighbouring countries. Eight supplements were successively issued to this work, the last as late as 1824. A fuller edition was published in 1794 by A. de la Gallaye, and added to their treasured by the birds of the country, whilst in the same year began Thomas Lord's valueless Entire New System of Ornithology, the text of which was written or corrected by Dr Dupree, and in 1793 Donovan began his Natural History of British Birds, a work which was about 1810—the earlier portion being issued about the same time. Bolton's Harmonia ruralis, an account of British song-birds, first appeared between 1794 and 1796, but subsequent editions are rare.

This is not one of the works which have been mentioned, but it is often quoted as an authority, for the simple reason that it is the work of a man who has devoted his life to the study of birds and their habits, and has made it his business to collect and publish all the information that has been brought to his notice, either by his own observation or by that of others. The work is divided into three parts, the first of which is devoted to the birds of the United Kingdom, and the second to those of the United States. The third part is devoted to the birds of the world, and contains a description of the habits and behaviour of each species, with a note of the locality in which it is found. The work is not without its faults, but it is of great value as a work of reference, and has been frequently consulted by ornithologists.

The earliest list of British birds we possess is that given by Merrett in his Pinax rurale etiam Britannica, published in London in 1667. In 1677 Plot published his Natural History of Oxfordshire, which reached a second edition in 1705, and in 1686 that of Staffordshire. A similar work on Lancashire, Cheshire, and the Peak was published in 1700 by Leigh, and one on Cornwall by a Mr. N. The four being published at Oxford. In 1766 appeared Pennant's British Zoology, a well-illustrated folio, of which a second edition in folio was published in 1766, and considerable additions (forming a second edition of the same work) in folio was published in 1773. In this year appeared the fourth edition of this work, in which all the additions therein made have been abridged and incorporated with the fourth edition. In 1781, long after the author's death, another edition was printed, which was reprinted by the British Museum, and which has been reprinted several times since. The work is a valuable one, and is still in use as a work of reference. It contains a list of the birds of the world, with a description of each species, and a note of the locality in which it is found. The work is not without its faults, but it is of great value as a work of reference, and has been frequently consulted by ornithologists.

1 His earlier work under the title of Pethnology can hardly be deemed scientific.

2 This extremely rare book has been reprinted by the Willughby Society.

3 Both of these treatises have also been reprinted by the Willughby Society.
familiar, and these are either waiting in expression or are caricatures; but those that were drawn from live birds, or represent species which he knew in life, are worthy of all praise. It is well known that the earlier editions of this work, especially if they be upon large paper, command extravagant prices; but in reality the copies on smaller paper are now the rarer, for the stock of them has been consumed in nurseries and schoolrooms, where they have been torn up or worn out with incessant use. Moreover, whatever the lover of these arts may say, it is nearly certain that the "Bewick Collector" or any of his imitators and followers in high spirits, do these old editions, for owing to the want of skill in printing—indifferent ink being especially assigned as one cause—many of the earlier issues fail to show the most delicate touches of the engraver, which indeed were not always done by this man (though under the supervision of John Hancock) has revealed—that must be admitted that certain blocks have suffered from wear of the press so as to be incapable of any more producing the effect intended. Of the text it may be said that it is respectable, but no more.

The existence of these two works explains the widely-spread taste for ornithology in England, which is to foreigners so puzzling, and the zeal—always according to knowledge, but occasionally reaching to serious study—with which that taste is pursued.

Ornithology in the 19th Century.

On reviewing the progress of ornithology since the end of the 18th century, the first thing that will strike us is the fact that general works, though still undertaken, have become proportionally fewer, while special works, whether relating to the ornithic portion of the fauna of any particular country, or limited to certain groups of birds—works to which the name of "Monograph" has become wholly restricted—have become far rarer. The above are not to be regarded as an argument against the multiplication of learned societies which issue publications as well as of periodicals of greater or less scientific pretension. A number of these must necessarily be left unnoticed here. Still it seems advisable to furnish some connected account of the progress made in the ornithological knowledge of the British Islands and those parts of the European continent which lie nearest to them or are most commonly sought by travellers, the Dominion of Canada and the United States of America, South Africa, India, together with Australia and New Zealand.

The more important monographs will usually be found cited in the separate articles on birds contained in this work, though some, by reason of changed views of classification, have for practical purposes to be regarded now as general works.

It will perhaps be most convenient to begin by mentioning some of these last, especially a galley proof which appears from what we are told by the author, in Paris very early in the 19th century. First in order of its appearance is the Histoire naturelle d'une partie d'oiseaux nouveaux et rares de l'Amérique et des Indes, a folio 4 published in 1801 by Le Vaillant. This is devoted to the very distinct and not nearly-allied genus of the American birds, which are assigned a better name we must call "Chatterers," and is illustrated, like those works of which a notice immediately follows, by coloured plates, done in what it was then considered to be the highest style of art and the best draughtsmen procurable. The first volume of a Histoire naturelle des perroquets, a companion work by the same author, appeared in the same year, and is truly a monograph, since the parrots constitute a family of birds so naturally severe from all the rest of the birds by their elegance and grace of style. The second volume came out in 1805, and a third was issued in 1837-1838 long after the death of his predecessor's author, by Bourjot St-Hilaire. Between 1803 and 1860 Le Vaillant also published a series of plates of birds and figures from the first volume of his Oiseaux d'Afrique, already mentioned. Four more volumes of this work were promised; but the means of executing them were denied to him, and, though he lived until 1824, his publications ceased.

A similar series of works was projected and begun about the same time by the Abbé Audubon, as it has been rather apt to be called, though the former, who was by profession a painter and illustrator, had much more intention in this work, which was already dead more than a year before the appearance of the two volumes, bearing date 1802, and entitled Oiseaux dorés ou à reflets métalliques, the effect of which, however, was more than lost in the lavish use of gilding. The first volume contains the "Colibris, Oiseaux-mouches, Jacamars et Promerops," the second the "Grimpereaux" and Oiseaux de Paradis—associations which set all the laws of systematics at defiance. In 1817 and 1818, therefore, appeared Le Désarlac's Histoire naturelle des plus beaux charitons de la Zone Torride with figures by Langlois of tropical finches, grosbeaks, buntings, and other hard-billed birds, and in 1827 and 1830 two volumes of a Histoire naturelle des oiseaux de la France, by Vaillant, to the place of which, though it was in 1833 to 1838, the plates were intended. Since 1827, every one of the plates of this latter work has been torn off the press, and is now procurable in the form of a fine octavo under the title of Ornithological Biography, of which more will be said in the sequel. Audubon has been greatly extolled as an ornithological artist; but he was far too much absorbed in the work to represent it in correct and true portraits that outrage nature, while his drawing is very frequently defective.

In 1866 D. G. Elliot began, and in 1869 finished, a sequel to Audubon's great work in two volumes, on the same scale with the New and Rare Birds of North America, containing life-size figures of all those which had been added to its fauna since the completion of the former.

In 1830 John Edward Gray commenced the Illustrations of Indian Zoology, a series of plates of vertebrated animals, but mostly of birds, from drawings, it is believed by native artists in the collection of General Hardwicke, whose name is therefore associated with the work. Scientific men are assigned to the species described, but no text was ever supplied. In 1832 Edward Lear, afterwards well known as a humorist, brought out his Illustrations of the Family of Psitaciadae, a volume which deserves especial notice from the excellence of the text and the great artistic skill with which the figures were executed.

This same year (1832) saw the beginning of the marvellous series of illustrated ornithological works by which the name of John Gould is likely to be always remembered. A Century of Birds from the Himalaya Mountains was followed by The Birds of Australia, New Zealand, and the adjacent islands, published at London in 1837-1844...
Birds of Europe in five volumes, published between 1832 and 1837, while in the interim (1834) appeared A Monograph of the Rhamphastidae, of which a second edition was some years later called for, the Icones avium, of which only two parts were published (1837-1838) and A Monograph of the Trochilidae or Humming-birds extending to five volumes, the last of which appeared in 1841, and was followed by a supplement by Mr. Salvin. A Monograph of the Odontophoridae or Partridges: of the Charadriiformes: of the Gallinae: of the Galliformes: and of the Ciconiiformes: of the Piciformes: and of the Caprimulgiformes. The last was completed by Mr. Sharpe (1850-1883); The Birds of Great Britain, in five volumes (1865-1873); and The Birds of New Guinea, begun in 1895, and, after the author's death in 1881, undertaken by Mr. Sclater, the long-tailed parrot, and the megapodes are the subjects of two folio volumes, and containing more than three thousand coloured plates. The earlier of these works were illustrated by Mrs. Gould, and the figures in them are fairly good; but those in the later, except when (as he occasionally did) he secured the help of the Mr. Wolf, are not so much to be commended. There is, it is true, a smoothness and finish about them not often seen elsewhere; but, as though to avoid the exaggerations of Audubon, Gould usually adopted a more or less general view of his work, which represents every expression as well as vivacity is wanting. Moreover, both in drawing and in colouring there is frequently much that is untrue to nature, so that it has not uncommonly happened for them to fail in the chief object of all zoological plates, that of affording sure guidance to those who are studying the birds. Although the letterpress, which was avowedly held to be of secondary importance to the plates, we must bear in mind that, to ensure the success of his work, it had to be written in a very peculiarly composed body, containing many words which only the learned and adroitly assumed that some of them even ornithologists—have thence been led to believe the text had a scientific value, and that of a high class. However, it may also be remembered that the work is of the same order as the Encyclopædia; and the convenience of working ornithologists by almost invariably refraining from including in his folio works the technical description of any new species without first publishing it in some journal of comparatively easier reading.

An ambitious attempt to produce in England a general series of coloured plates on a large scale was Louis Frasere's Zoologia Typica, a work of the first part of which bears date 1841-1842. Others appeared in the regular course of the 1848-1850. Fraser's plates, which seem never to have received the support it deserved, were discontinued. The seventy plates (forty-six of which represent birds) composing, with some explanatory letterpress, the volume, are by C. Cousens and H. N. Turner—the latter (as his publications through the medium of the Zoological Society's Proceedings) have already shown himself to be one of the most active and skilful of the illustrators of the present time. Fraser had also an object in view, and describes in its Proceedings, until which the year 1848 were not illustrated.

The publication of the Zoological Sketches of Joseph Wolf, from animals in the possession of the Zoological Society's Loan, which began about 1885, with a brief text by D. W. Mitchell, at that time the Society's secretary, in illustration of them. After his death in 1859, the explanatory letterpress was rewritten by W. L. Sclater, his successor in that office, and a monograph completed in 1861. Upon this a second series was commenced, and brought to an end in 1868. Though a comparatively small number of species of birds are figured in this magnificent work (seventy plates, but twenty-three only two of the plates were mentioned here, for their likenesses are so admirably executed as to place it in regard to ornithological portraiture at the head of all others. There is not a single plate that is unworthy of the greatest of all animal painters.

Telemann and Lang. Figures of a general less pretentious size, but of greater ornithological utility than the books last mentioned, which are fitted for the drawing-room rather than the study, we next have to consider some in which the text is not wholly subordinate to the plates, but the plates are not wholly independent of them. First of these is the Nouveau recueil des planches coloriées d'oiseaux de Temminck and Langier, intended as a sequel to the Planche d'ornithologie par Mr. Auberde. The twelve plates are issued both in folio and quarto size. The first portion of this was published at Paris in 1820, and of its one hundred and two illustrations, which appeared with great irregularity, the last was issued in 1830, containing the titles of the five volumes that the whole forms, together with a Tableau méthodique of the subject of each plate has letterpress to correspond, but in some cases this is wanting, while on the other hand descriptions of species not figured are occasionally introduced, and usually observations on the distribution and construction of each genus or group are added. The plates are large improvements on those of Martinet. The pictures are after drawings by Mr. Ch. Pretre, the former being perhaps the less bad draughtsman of the two, for he seems to have had an idea of what a bird when alive looks like, though he was not able to give his figures any vitality, while the latter merely delineated them. The colouring is pretty well done, and experience has proved that generally speaking there is not much difficulty in recognizing the species represented. The letterpress is commonly limited to technical details—of which there is, however, generally a good deal—and is in general knowledge of the outside of birds Temminck probably surpassed any of his contemporaries. The Tableau méthodique offers a convenient concordance of the old Planches enluminées and its authorship in the hands of Temminck in the first volume of the second edition of his Manuels d'ornithologie, of which something must presently be said.

The Galerie des oiseaux, a rival work, with plates by Oudart, seems to have been begun immediately after the former. The original project was apparently to give a full and accurate description of every species of birds; but that was soon found to be impossible; and, when six parts had been issued, by text by an unnamed author, the scheme was brought within practicable bounds. It was entrusted to Vieillot, who, proceeding on a systematic plan, performed his task very creditably. The works, which forms two quarto volumes, in 1825, the original text and fifteen plates were issued, the completed volume having been published as a supplement. His portion is illustrated by two hundred and ninety-nine coloured plates that, wretched as they are, have been continually reproduced in various text-books—a fact possibly due to the pecuniary advantages which the work promised. It is clear that, this work not being favourably regarded by the authorities of the Paris Museum, its draughtsman and author were refused access to the specimens required, and had to draw and describe them entirely frompicture of the same cases, for which purpose a very original artist was engaged.

In 1825 Jardine and Selby began a series of Illustrations of Ornithology, the several parts of which appeared at long and irregular intervals, so that it was not until 1839 that three volumes containing one hundred and five plates were completed. Then they set about a Second Series, which, forming a single volume with fifty-three plates, was finished in 1843. These authors, being zealous amateur artists, were their own draughtsmen to the extent even of lithographing the figures. In 1828 James Wilson, the author of the articles in the 8th edition of the Encyclopædia of Ornithology, published a series of his own drawings (which he did not, however, himself engrave) with corresponding letterpress. The plates were not so well executed, the small volume, a small folio, twenty are devoted to Ornithology, and contain figures, which, it must be allowed, are not very successful, of several species rare at the time.

The Planche enluminée of Audubon is mentioned above, but of the same category as the Planches enluminées and the Planches coloriées, no one of them can be properly deemed their rightful heirs. The claim to that succession was made in 1845 by M. Des Murs for his Monographie ornithologique, which, containing seventy-two plates by Prévot and Oudart (the latter of whom had marvellously improved in his drawings since he worked with Vieillot), was completed in 1849. Simultaneously with this, Des Murs began a work on a plan precisely similar, the Esquisse ornithologique, illustrated by Mr. Du Bus, which, however, stopped short in 1849 with its thirty-seventh plate, while the letterpress unfortunately does not go beyond that belonging to the twelfth. In 1866 the succession was again taken up by the exotic plates of Selby and Sclater, and the hundred plates, representing one hundred and four species, all from Central or South America, which are neatly executed by J. Smit. The accompanying letterpress, in some cases, are not as correct as the plates of some of various genera are occasionally subjoined, adding to the definite value of the work, which, forming one volume, was completed in 1869.

Rowley's Ornithological Miscellany is in three quarto volumes, and is still in progress. The first volume, containing eighty plates, was published in 1878. The contents are as varied as the authorship, and, of the leading English ornithologists having contributed to the work, some of the papers are extremely good, while in the plates, many rare species of birds are figured, some of them for the first time.

More recent monographs have been more exact, and some of them equally sumptuous. Amongst these may be mentioned F. E. du Clos's Monographie des Aulures (1874), which, besides a Monographie des Lores (1823), the Hou. W. R. Smith's Monographie in the genus Casuarina (1899, quarto), R. B. Sharpe's
ORNITHOLOGY

Monograph of the Paradisaeidae (1898, folio); II. Seebold's Monograph of the Thraupes (1900, imp. quarto); J. G. Millais' British Surface-feeding Ducks (1902, folio); and the Hon. W. Rothschild's Extinct Birds (1907, quarto).

Most of the works last named, being very costly, are not easily accessible. The few next to be mentioned, being of smaller size (octavo), may be within reach of more persons, and, therefore, can be passed over in a brief fashion without detriment. In many ways, however, they are nearly as important. Swainson's Zoological and Ornithological Monograph (1832), and the first edition of Temminck's Systema Naturae, containing much valuable information. The views of this latter of these systematists pleased Temminck, who in 1817, replied rather sharply to Vieillot in some Observations sur la classification méthodique des oiseaux, a pamphlet published at Amsterdam, and prefixed to the second edition of his Monographie systématique des oiseaux (1818).

Swainson:—and eighty-two plates, wherein seventy seven birds, appeared between 1820 and 1821, and in 1820 a second series of the same was begun by him, which, extending to another three volumes, was completed by him in 1832, of which the hundred and thirty-six, and was completed in 1833. All the figures were drawn by the author, who as an ornithologist had no rival in his time. Every plate is not beyond criticism, but his worst detractors would be hard, it is believed, to say, that the English or French contemporaries. A work of somewhat similar character, but one in which the letterpress is of greater value, is the Centurie zoologique of Lesson, a single volume that, though bearing the date 1830 on its title-page, though to have been begun in 1829,1 and was certainly not finished until 1831. It received the benefit of Isidore Geoffroy St-Hilaire's assistance. Notwithstanding its name it only contains eighty plates, but of them forty-two, all by Prêtre and in his usual stipple engraving style, are copies of sixty plates of Lesson's Traité d'ornithologie, which is dated 1831, and may perhaps be here most conveniently mentioned. Its professedly systematic form strictly relates it to another group of works, but the presence of of and the fact of a systematic order of the plates for the most part to some extent justifies its notice in this place. Between 1831 and 1834 the same author brought out, in continuation of his Centurie, his Illustrations de zoologie with sixty plates, twenty of which represent the work of him and the other forty, entitlés zur Naturgeschichte der Vogel, in which many new species are figured; but the work came to an end with its thirty-sixth plate in the following year. In 1845 Reichenbach produced his System der Vögel, a work of the extraordinary series of illustrated publications which under titles far too numerous here to repeat, ended in or about 1855, and are commonly known collectively as his Vollständige system der Vögel. Herein are contained more than nine hundred coloured and more than three hundred uncoloured plates, which are crowded with the figures of birds, a large proportion of them reduced copies from other works, and especially those of Goetz.

It now behoves us to turn to general and particularly systematic works in which plates, if they exist at all, form but an accessory to the text. These need not detain us for long, since, however well some of them may have been executed, being bound to their epoch it would be futile to compare their delineations with those in our time. Nor shall we here enter on the question of the relative value of the plates of such works as the Zoologisches System der Vögel of Rothmaler and Vieillot, the work of Temminck and his successors, and that of the late Sir W. J. Hooker. We shall content ourselves with a statement of the fact that the publication of the Zoologisches System der Vögel in 1849, were equally arbitrary and abortive; but his Skizzen-Entwicklungsgeschichte in 1829 must be here named, as it is so often quoted on account of the number of genera which he erected, and which he afterwards was able to reduce to some extent. These works he shared more or less with Vigors and Swainson, and to them attention will be immediately especially invited, although the scheme gradually developed from 1831 onward by them, and published separately, and still not without its influence, is deferred. In the next place it is our business to consider the classification and progress of what we may term the reformed school of ornithology. Yet injustice would be done to one of the ablest of those who were called the old masters of the science if mention were not made of the work of Shaw, a man of almost quixotic principles of classification, and yet in every respect a real systematist. He was born in 1800, and as the last of the British Museum, began with A List of the Genera of Birds published in 1840. This, having been closely, though by no means in a hostile spirit, criticized by Strickland (Ann. Nat. History, vi. p. 15), an improved edition was brought out in 1841, in which nearly all the corrections of the reviewer were adopted, and in 1844 began the publication of The Genera of Birds, beautifully illustrated—first by Mitchell and afterwards by Mr Wolf—which will long remain a work of great utility and remembrance. The enormous labour required for this work was not lessened by the fact that it occupied a quarter of a century, though it remains to this day one of the most useful books in an ornithologist's library. Yet it must be confessed that its author was hardly an ornithologist, but for the accident of his calling. He was, moreover, a curious and unsparing trouble. However, to have conceived the idea of procuring a work so grand a scale as this—it forms three folio volumes, and contains one hundred and eighty-five coloured and one hundred and forty-eight leaves by the British Museum, A Catalogue of the Genera and Subgenera of Birds, a handy little volume, naturally founded on the larger works. Its chief drawback is that it does not give any more reference to the authority for the new classification, which is not given in the index, and the year of its publication, though of course more possible, information would have at least doubled the size of the book. The same deficiency became still more apparent when, between 1869 and 1871, he published his Hand-List of Genera and Species of Birds in three volumes (1813–1814, p. xxviii); but, through the postponements of that stormy period, the order was never carried out (Mem. Ascd. St. Louis. 1873). Considering the classification as published, the Society of London shows that its Prosau was read at meetings of that Society between the 15th of November 1814 and the 21st of February 1815. Why it was not at once accepted is not told, but the entry respecting it, though not of great note, appears in the Royal Society's Register. Papers "Published already." It is due to Vieillot to mention these facts, as he has been accused of publishing his work in haste to anticipate some of Cuvier's views, but he might well complain of the delay in London. Some repARATION has been made to his memory by the republication of this invaluable work.

1 In 1828 he had brought out, under the title of Monodia ornithologie, two handy duducopédicos which are very valuable of the classification of the families, and will be found in vain to get printed before, both in Turin and in London.4 Some of the ideas in this are said to have been taken from Illiger; but the two systems seem to be wholly distinct. Illiger was afterwards more fully expounded in the series of articles which he contributed between 1816 and 1819 to the second edition of the Nouveau dictionnaire de zoologie. One of the most important was that of the nature of certain mammals containing much valuable information. The views of Necker are entitled to be more extensively considered in the second edition of his Monographie systematique, in which his Monographie systematique, published at Amsterdam, and prefixed to the second edition of his Monographie systematique, was called "Analyse et Classification de l'histoire naturelle des oiseaux," a very respectable compilation—came to treat of birds, and then followed to some extent the plan of De Blainville and Merrem (concerning which much more has to be said of the Struthious birds in an Order by themselves."

2 In 1827 Wagler brought out a system of a Systema avium, in this form never completed, consisting of forty-nine detached monographs of as many genera, the species of which are most elaborately described. The arrangement is subsequently adopted for them and for other groups.

3 In 1849, was equally arbitrary and abortive; but his Skizzen-Entwicklungsgeschichte in 1829 must be here named, as it is so often quoted on account of the number of genera which he erected, and which he afterwards was able to reduce to some extent. These works he shared more or less with Vigors and Swainson, and to them attention will be immediately especially invited, although the scheme gradually developed from 1831 onward by them, and published separately, and still not without its influence, is deferred. In the next place it is our business to consider the classification and progress of what we may term the reformed school of ornithology. Yet injustice would be done to one of the ablest of those now to be called the old masters of the science if mention were not made of the work of Shaw, a man of almost quixotic principles of classification, and yet in every respect a real systematist. He was born in 1800, and as the last of the British Museum, began with A List of the Genera of Birds published in 1840. This, having been closely, though by no means in a hostile spirit, criticized by Strickland (Ann. Nat. History, vi. p. 15), an improved edition was brought out in 1841, in which nearly all the corrections of the reviewer were adopted, and in 1844 began the publication of The Genera of Birds, beautifully illustrated—first by Mitchell and afterwards by Mr Wolf—which will long remain a work of great utility and remembrance. The enormous labour required for this work was not lessened by the fact that it occupied a quarter of a century, though it remains to this day one of the most useful books in an ornithologist's library. Yet it must be confessed that its author was hardly an ornithologist, but for the accident of his calling. He was, moreover, a curious and unsparing trouble. However, to have conceived the idea of procuring a work so grand a scale as this—it forms three folio volumes, and contains one hundred and eighty-five coloured and one hundred and forty-eight leaves by the British Museum, A Catalogue of the Genera and Subgenera of Birds, a handy little volume, naturally founded on the larger works. Its chief drawback is that it does not give any more reference to the authority for the new classification, which is not given in the index, and the year of its publication, though of course more possible, information would have at least doubled the size of the book. The same deficiency became still more apparent when, between 1869 and 1871, he published his Hand-List of Genera and Species of Birds in three volumes (1813–1814, p. xxviii); but, through the postponements of that stormy period, the order was never carried out (Mem. Ascd. St. Louis. 1873). Considering the classification as published, the Society of London shows that its Prosau was read at meetings of that Society between the 15th of November 1814 and the 21st of February 1815. Why it was not at once accepted is not told, but the entry respecting it, though not of great note, appears in the Royal Society's Register. Papers "Published already." It is due to Vieillot to mention these facts, as he has been accused of publishing his work in haste to anticipate some of Cuvier's views, but he might well complain of the delay in London. Some repARATION has been made to his memory by the republication of this invaluable work.4

4 The method was communicated to the Turin Academy, on 10th January 1814, and was ordered to be printed (Mem. Ac. Sc. Turin,
As subsequently modified by Swainson (tem. cit. pp. 224, 225), the foregoing propositions take the following form:

I. That every natural series of beings in its progress from a given point, either actually returns, or evinces a tendency to return, in the animal kingdom, to the class of the鸟 by which it was enwrapp'd in alluring mystery, but more to the confidence with which it was announced as being the long-look'd-for key to the wonders of creation, since its promoters did not hesitate to term it the discovery of "the Natural System," though they condescended, by way of explanation, to less exalted intellects than their own, to allow it the more moderate appellation of the Circular or Quinary System.

A comparison of the relation of created beings to a number of intersecting circles is as old as the days of Niemeyer, who in 1635 wrote (Historia naturalis, lib. iii. cap. 3)—"Nullus hiatus est, nullum fructum, nullum disjunctio, vestigium, neque progressus est." It is almost clear that he was thinking only of a chain. In 1866 Fischer de Walehime, in his Tableaux synoptiques de zoologie (p. 151), quoting Niemeyer, extended his figure of speech, and, while justly depreciation the latter, he threw nothing to show that Fischer intended, by what is here said, to do anything else than illustrate more fully the marvellous interconnexion of different animals, or that he attached any realistic meaning to his metaphor, his words were eagerly caught up by the propugnators of the system. This was William Sharpe Macleay, a man of education and real genius, who in 1819 and 1821 brought out a work under the title of Horae Entomologicae, which was soon after hailed by Vigors and subsequently revised and amplified by him to ordnithology in some parts, and yet he could not be called a scientist proper to the sense except in the terms of a believer. Their enunciation must therefore be given in Swainson's own words, though it must be admitted that space cannot be found here for the diagrams, which it was alleged were necessary for the right understanding of the theory. This theory, as originally propounded by Macleay, was said by Swainson in 1835 (Geog. and Classific. of Animals, p. 202) to have consisted of the following propositions:

1. The natural affinities are continuous, forming, as it were, a circle; that is, a perfect circle, the starting point of which is the point of departure for all the affinities of the same species, and also for all the affinities of the same order, and so on. A perfect circle is composed of as many different affinities as there are species in the animal kingdom.

2. That all affinities are natural and that none do not exhibit, or show an evident tendency to exhibit, such a circular series.

3. That the primary divisions of very large group are ten, five of which are composed of comparatively large circles, and five of which are composed of smaller ones, but so divided that the latter will be termed as the primary division of the former, which they serve to connect.

4. That there is a tendency in such groups as are placed at the opposite points of the circle, as if it affords a rule for the formation of species, and that the order of magnitude of the groups is perfectly formed by the same rule.

5. Those of the five larger groups into which every natural circle is divided, bears a resemblance to the rest of the series, or, more strictly speaking, consists of types which represent those of each of the four other groups, together with a type peculiar to itself.

We prefer giving them here in Swainson's version, because he seems to have set them forth more clearly and concisely than Macleay ever did, and, moreover, Swainson has devoted himself to ornithology—a branch of science that lays outside of Macleay's proper studies—appears to be more suitable to the present occasion.

W. L. Buller's Beasts of New Zealand (4to, 1873), with coloured plates by Keulemans, since the publication of which the same author has issued a Manual of the Birds of New Zealand (8vo, 1883), founded on the former; but justice requires that mention be made of the labours of G. R. Gray, first in the Appendix to Diefenbach's Travels in New Zealand (1843) and then in the ornithological portion of the Zoology of the Voyage of H. M. S. Erebus' and Terror, begun in 1841, but left unfinished from the two-year interval during which Mr. Sharpe in 1876. A considerable number of valuable papers on this country by Sir W. L. Buller, Drs Hector and Von Haast, W. F. Hutton, Mr Potts and others are to be found in the Transactions and Proceedings of the New Zealand Institute. Sir W. L. Buller's Supplement to the Birds of New Zealand (1908-1909) completes the great work of this author.

Passing to Australia, we have the first good description of some of its birds in the several old voyages and in Latham's works before the time of Horsfield. It was only a method of adding those of a few more, as did J. W. Lewin's Natural History of the Birds of New South Wales (4to, 1822), which reached a third edition in 1838. Gould's great Birds of Australia has been already mentioned, and is, perhaps, the most important of the kind, with the text of that work under the title of Handbook to the Birds of Australia (2 vols 8vo, 1865). In 1866 Mr Diggle commenced a similar publication, The Ornithology of Australia, but the coloured plates were not completed, and are now to be expected from Mr. T. Deane, the successor. This is still incomplete, though the parts that have appeared have been collected to form two volumes and issued with title-pages. Some notices of Australian birds by Mr Ramsay and others are to be found in the Proceedings of the Royal Society of New South Wales and of the Royal Society of Tasmania.

Coming to British Indian possessions, and beginning with Ceylon, we have Kelaart's Prodromus faunca Zelandiae (8vo, 1852), and the Great British Birds (4to, 1878-1880), with coloured plates by Mr Keulemans of all the peculiar species. It is hardly possible to name a book that has been more conscientiously executed than this. Blyth's Manual of the Birds of Formosa contains valuable information. Jerdon's Birds of India (8vo, 1862-1864); reprinted 1877) is a comprehensive work on the ornithology of the peninsula. A very fairly executed compilation on the subject by an anonymous writer is to be found in a late edition of the Cyclopedia of India, published at Madras, and W. T. Blanford's Birds of British India (1868) remains the standard work.

Stray Feathers, an ornithological journal for India and its dependencies, contains many interesting and some valuable papers. In regard to South Africa, besides the well-known work of Le Vaillant, there is the second volume of Sir Andrew Smith's Illustrations of the Zoology of South Africa (4to, 1838-1842), which is devoted to this. This is an important but cannot be called a satisfactory work. Its one hundred and fourteen plates by Ford truthfully represent one-third of the birds. The other two-thirds are not worked upon by the author in his explorations into the interior. Layard's handy Birds of South Africa (8vo, 1867), though by no means free from faults, has much to recommend it. A so-called new edition of it by R. B. Shaw appears to have been little more than a reprint, and so wholly different that it must be regarded as a distinct work. C. J. Anderson's Notes on the Birds of Damara Land (8vo, 1872), edited by J. H. Gurney, was useful in its day, but has been superseded by a more comprehensive and extremely accurate volumes, the Birds of Africa, by G. E. Shelley (1900-1907), and the German work on the same subject by Anton Reichenow (1900-1905).

Of special works relating to the British West Indies, C. Waterton's well-known Wandering has passed through several editions, and has been executed by a nominal list, with references, of the birds of the island is contained in the Handbook of Jamaica.

The admirable series of Faunal Publications relating to North American Ornithology 1878 to 1878 has been begun by Elliott Coues as an appendix to his Birds of the Colorado Valley (pp. 567-784). Special mention should be made of the following works most of which have appeared since that time: S. F. Baird and C. R. Ridgway, History of North American Birds: The Land Birds (3 vols, Boston, 1875), The Water Birds (2 vols, Boston, 1884); Elliott Coues, Check List of North American Birds (Boston, 1882), Key to the Rarities of the British Birds (London, 1884); Audubon's Birds of North America, U.S. Geological Survey, Misc. publs, No. 3 (1874) and Birds of the Colorado Valley, ibid, No. 11 (1878); Robert Ridgway, Manual of North American Birds (Philadelphia, 1887); Frank M. Chapman, Collins's North American Birds (Boston, 1888); William H. Emory, Birds of Eastern North America (ibid, 1895) and The Warblers of North America (ibid, 1907), with notable coloured illustrations by L. A. Fuertes and Bruce Howald; Dr. A. K. Fisher, Hawks and Owls of North America and Their relations to Agriculture, U.S. Department of Agriculture, Bull. No. 3 (Washington, 1910). Further important work: D. G. Elliot, Gallinaceous Game Birds of North America (New York, 1897) and Wild Fowl of the United States and British North America (1898), and Robert Ridgway's learned and invaluable Birds of North and South America (New York, 1898) which is the work of the Ornithological Institution, Bull. No. 50 (Washington, 1901 sqq.). Among contempor-
The Prodomus der islaéischen Ornithologie (8vo, 1822), though the island has since been visited by several good ornithologists—

Proctor, Krüper and Wolley among them. A list of its birds, with some notes, bibliographical and biological, has been published, as an Appendix to Baring-Gould's Natural History of the Azores (8vo, 1850), and the account of the bird life of the American islands, by Mr. N. L. S. Barco da Fonseca, is contained in his Works (8vo, 1866-1872). The work in this field has been greatly extended by the publication of the Bulletin de la Société Ornithologique de France, which contains many important contributions, especially during the last few years. Among the most noteworthy of these is the paper of Mr. A. Smith, on the Fauna of the Azores (8vo, 1875), which contains a complete list of the birds of the island, with notes on their habits, distribution, and other interesting facts. The work is well illustrated, and is an important contribution to the knowledge of the ornithology of this interesting group of islands.
second edition is best. In 1828 Fleming brought out his History of British Animals (8vo), in which the birds are treated at considerable length (pp. 41-146), though not with great success. In 1835 Mr Jenyns (afterwards Blomefield) produced as excellent Manual of British Vertebrate Animals, a volume (8vo) executed with great scientific skill, the birds again receiving due attention (pp. 49-986), and the descriptions of the various species being as accurate as they are terse. In the same year began the Coloured Illustrations of British Birds and their Eggs of H. C. Lilford, which was completed in 1843, whereof a second edition (7 vols. 8vo, 1842-1850) was brought out, and subsequently (1852-1857) a reissue of the latter. In 1836 appeared Eyllon's History of the rarer British Birds, intended as a sequel to Bickw's well-known volumes, to which no important additions had been made since the issue of 1821. The year 1837 saw the beginning of two remarkable works by Macgillivray and Jarrett respectively, and each entitled A History of British Birds. Of Jarrett's work in three volumes, a second edition was published in 1854, a third in 1856, and a fourth, begun in 1857, and almost wholly rewritten. Of the compilations based upon this work, without which they could not have been composed, there is no need to speak. One of the few appearing since, with the same scope, that are not borrowed is Jardine's Birds of Great Britain and Ireland (4 vols. 8vo, 1838-1843), forming part of his Naturalist's Library; and Gould's Birds of Great Britain has been already mentioned. The local works on English birds are too numerous to be mentioned; almost every county has had its ornithological record. Of more recent general works there should be mentioned A. G. Butler's British Birds with their Nests and Eggs (6 vols. 1896), the various editions of Howard Saunders's Manual of British Birds, and Lord Lilloo's beautifully illustrated Coloured Figures of the Birds of the British Islands (1858-1897).

**Taxonomy.**

The good effects of "Faunal" works such as those named in the foregoing rapid survey none can doubt, but important as they are, they do not of themselves constitute ornithology as a science; and an inquiry, no less wide and far more recondite, still remains. By whatever term we choose to call it—Classification, Arrangement, Systematizing or Taxonomy—that inquiry which has for its object the discovery of the natural groups into which birds fall, and the mutual relations of those groups, has always been one of the deepest interest. It is now for us to trace the rise of the present more advanced school of ornithologists, whose labours yet give signs of far greater promise.

It would probably be unsafe to place its origin further back than a few scattered hints contained in the "Pterographische Fragmente" of Christian Ludwig Nitzsch, published in the Magazin für den neuesten Zustand der Naturkunde (edited by Voigt) for May 1766 (xi. pp. 393-417), and even these might be left to pass unnoticed, were it not that we recognize in them the germ of the great work which the same admirable zoologist subsequently accomplished. In these "Fragments," apparently his earliest productions, we find him engaged on the subject of groups by which his name will always be associated with the structure and arrangement of feathers. In the following year another set of hints—of a kind so different that probably no one then living would have thought it possible that they should ever be brought into correlation with those of Nitzsch—are contained in a memoir on Fishes contributed to the tenth volume of the Annales du Muséum d'histoire naturelle of Paris by Etienne Geoffroy St-Hilaire in 1807.1 Here we have it stated as a general truth (p. 100) that young birds have the sternum formed of five separate pieces—one in the middle, being its keel, and two "annexes" on each side to which the ribs are articulated—all, however, finally uniting to form the single "breast-bone." Further on (pp. 101, 102) we find observations as to the number of ribs which are attached to each of the "annexes"—there being sometimes more of them articulated to the anterior than to the posterior, and in certain forms no ribs belonging to one, all being applied to the other. Moreover, the author goes on to remark that in adult birds trace of the origin of the sternum from five centres of ossification is always more or less visible in the suture, and that these sutures had been generally regarded as ridges for the attachment of the sternum muscles, they indeed mark the extreme points of the five bony pieces of the sternum.

In 1810 appeared at Heidelberg the first volume of F. Tiedemann's carefully-wrought Anatomie und Naturgeschichte der Vögel, which Cuvier did not wait in 1809, and in some respects is superior to his later production of 1817. It is, however, only noticed here on account of the numerous references made to it by succeeding writers, for neither in this nor in the author's second volume (not published until 1814) did he pronounce any systematic arrangement of the Class. More germane to our present subject are the Osteographische Beiträge zur Naturgeschichte der Vögel of C. L. Nitzsch, printed at Leipzig in 1811—a miscellaneous set of detached essays on some peculiarities of the skeleton or portions of the skeleton of certain birds—one of the most remarkable of which is that on the component parts of the foot (pp. 101-105) pointing out the aberration from the ordinary structure exhibited by the Goat-sucker (Caprimulgus) and the Swift (Cypselus)—an aberration which, if rightly understood, would have conveyed a warning to those ornithological systematists who put their trust in birds for characters on which to erect a classification, that there was in them more of importance, hidden in the integument, than had hitherto been suspected; but the warning was of little avail, if any, till many years had passed. However, Nitzsch had not as yet seen his way to proposing any methodical arrangement of the various groups of birds, and it was not until some eighteen months later that a scheme of classification in the main anatomical was attempted.

This scheme was the work of Blasius Merrem, who, in a communication to the Academy of Sciences of Berlin on the 26th December 1812, which was published in its Abhandlungen for the following year (pp. 237-250), set forth a Tentamen systematis naturalis avium, no less modestly entitled than modestly executed. The attempt of Merrem must be regarded as the virtual starting-point of the latest efforts in Systematic Ornithology, and in that view its proposals deserve to be stated at length. Without pledging ourselves to the acceptance of all its details—some of which, as is only natural, cannot be sustained with our present knowledge—it is certainly not too much to say that Merrem's merits are almost incomparably superior to those of any of his predecessors. Premising then that the chief characters assigned by this systematist to his several groups have been drawn from almost all the parts of the structure of birds, and are supplemented by some others of their more prominent peculiarities, we present the following abstract of his scheme:—

1. AVES CARNATAE.
   a. Aves aereae.
      b. Aves amictae—
         1. Rapaces—
            b. Seriz.
         2. Hymenopodes—
            a. Chelidonex:—a. C. nocturnae—
               Caprimulgus; b. C. diurnae—Hirundo.
            b. Oeuncas:—a. O. centrostres—
               Loxia, Fringilla, Emberiza, Tangara; b. O. tetrostres—
               Alauda, Motacilla, Muscicapa, Todius, Lanius, Anempis, Tur- 
               mina, Parus, Luscinia, Strepera, Merivora, Myiorynchus,
               Oriolus, Gracula, Coracias, Corvus, Pycro, Parus, Sitta, 
               Certhia quoadem.
      b. C. Mellissae—
         3. Cherubinae—
            a. Trochilinae—
               Certhiae et Upupa plumiae plurimae.
               Dendrocolaptes.—Picus, Xyzz.
               E. Brevilignae.—a. Upupa; b. Ispidae.
         4. Levirostris—
            a. Ramphastis, Scyphoeas; b. Psitacae.
      b. C. Veneris—
         5. Procellariidae—
            a. Columna. 
            b. Gallinae.
         6. Aves terreræ—
            a. Odonatychini:—a. Boscades—Anas; b. Mergus; 
               c. Phoenicopetoma.

Footnotes:
1 The names of the genera are, he tells us, for the most part those of Linnaeus, as being the best-known, though not the best. To some of the Linnaean genera he dare not, however, assign a place, for instance, Bucerotis, Homatopus, Morops, glareola (Brison's genus by the by) and Palamedea.
ORNITHOLOGY

A. Platyrynchi.—**Pelecanus, Phaeton, Plotos.**
B. Apioenidiotes.
E. Scopelophycti.—**Procellaria, Diomedes, Larus, Serna, Rhynchops.**

4. Aves palustris.

5. Aves rattræe. — **Struthio.**

The most novel feature, and one the importance of which most ornithologists of the present day are fully prepared to admit, is the separation of the class **Aves** into two great divisions, which from one of the most obvious distinctions they present were called by its author **Carinatae** and **Rattæa,** according to the sternum possesses a keel (crista in the phraseology of many anatomists) or not. But Merrem, who subsequently communicated to the Academy of Berlin a more detailed memoir on the **"flat-breasted"** birds, was careful not to rest his divisions on the presence or absence of their sternal character alone. For though he admitted (op. cit. p. 288) that the peculiar characters of more or less value as peculiar to the Carinate Division, the first of which is that the feathers have their barbs furnished with hooks, in consequence of which the barbs, including those of the wing-quills, cling closely together; while among the rest may be mentioned the position of the furcula and coracoids, which keep the wing-bones apart; the limitation of the number of the lumbar vertebrae to fifteen, and of the carpals to two; as well as the divergent direction of the iliac bones—the corresponding characters peculiar to the Rattæa Division being the disconnected condition of the barbs of the feathers, through the absence of any hooks whereby they might cohere; the non-existence of the furcula, and the coalescence of the coracoids with the scapulae (or, as he expressed it, the extension of the scapulae to supply the place of the coracoids, which he thought were wanting); the lumbar vertebrae being twenty and the carpals three in number; and the parallelism of the iliac bones.

As for Merrem’s partitioning of the inferior groups there is less to be said in its praise as a whole, though credit must be given to his anatomical knowledge for leading him to the perception of several affinities, as well as differences, that had never before been suggested by superficial systematists. But it must be confessed that (chiefly, no doubt, from paucity of accessible material) he overlooked many points, both of alliance and the opposite, which since his time have gradually come to be admitted.

Notice has next to be taken of a Memoir on the Employment of Sternal Characters in establishing Natural Families among Birds, which was read by De Blainville before the Academy of Sciences of Paris in 1815; but not published in full for more than five years later (Journal de physique ... et des arts, xci. 185-215), though an abstract forming part of a Prodrome d’une nouvelle distribution du règne animal appeared earlier (op. cit. lxxxii. 252, 253, 258, 259; and Bull. soc. philomath. de Paris, 1816, p. 110).

This is a very disappointing performance, since the author observes that, notwithstanding his new classification of birds is based on a study of the form of the sternal apparatus, yet, because that lies wholly within the body, he is compelled to have recourse to such outward characters as are afforded by the proportion of the limbs and the disposition of the toes—even as if he had been the practice of most ornithologists before him. It is evident that the feature of the sternum of which De Blainville chiefly relied were those drawn from its posterior aspect, which no very extensive experience of specimens is needed to show are of comparatively slight value; for the number of "échancrures"—notches as they have sometimes been called in English—when they exist, goes but a very short way as a guide, and is so variable in some very natural groups as to be even in that short way occasionally misleading. There is no appearance of his having at all taken into consideration the far more trustworthy characters furnished by the anterior part of the sternum, as well as by the coracoids and the furcula. Still De Blainville made some advance in a right direction, as for instance by elevating the parrots and the pigeons as "Ordres," equal in rank to that of the birds of prey and some others. According to the testimony of L’Herminier (for whom see later) he divided the "Passereaux" into two sections, the "Faux" and the " vrais"; but, while the latter were very correctly defined, the former were most arbitrarily separated from the "Grimpeurs." He also split his Grallatores and Natatores (practically identical with the Grallæ and Anseres of Linnaeus) each into four sections; but he failed to see—as a general principle he ought to have seen—that each of these sections was at least as distinct from others as his own "Ordres." He had, however, the courage to act up to his own professions in collocating the rollers (Coracias) with the beecators (Merops), and had the sagacity to surmise that *Menura* was not a Gallinaceous bird. The greatest benefit conferred by this memoir is probably that it stimulated the efforts, presently to be mentioned, of one of his pupils, and that it brought more distinctly into sight that other factor, originally discovered by Merrem, of which it now clearly became the duty of systematizers to take cognizance.

Following the chronological order we are here adopting, we next have to recur to the labours of Nitzsch, who, in 1820, in a treatise on the nasal glands of birds—a subject that had already attracted the attention of Jacobson (Nov. Bull. soc. philomath. de Paris, iii. 267-269)—first put forth in Meckel’s Deutsches Archiv für die Physiologie (vi. 251-259) a statement of his general views on ornithological classification which were based on a comparative examination of those bodies in various forms. It seems unnecessary here to occupy space by giving an abstract of his plan, which hardly includes the full extent of his mean speculations on the subject. He was the first to attempt to base a new system of classification on a comparison of the internal structure of nearly every genus in conjunction with the author’s prefatory remarks, as each passed under consideration, *e.g.* *Cf. Merrem, Transact. (1820),* pp. 337, note. *This view of them had been long before taken by Willughby, but abandoned by all later authors.*

This plan, having been repeated by Schöps in 1829 (loc. cit. xii. p. 73), became known to Sir R. Owen in 1835, when then drew to the attention of Kirby (Seventh Bridgewater Treatise, ii. pp. 444, 445), and in the November year referred to it in his own article "Aves" in *Todd’s Cyclopaedia of Anatomy* (i. p. 266), so that Englishmen need no excuse for not being aware of one of Nitzsch’s labours, though his more advanced *op. cit. of 1839, presently to be mentioned,* was not referred to by Sir R. Owen.

---

1 From *carina,* a keel.
2 From *ratae,* a rait or flat-bottomed barge.
4 Merrem, as did many others in his time, calls the coracoids "alpecalois"; but it is now well understood that in birds the real *alpecaloia* form the furcula or "merry-thought."
5 Not 1812, as has sometimes been stated.
and these descriptions being almost without exception so drawn up as to be comparative are accordingly of great utility to the student of classification, though they have been so greatly neglected. Upon these descriptions he was still engaged till death, in 1837, put an end to his labours, when his place as Naumann's assistant for the remainder of the work was taken by Rudolph Wagner; but, from time to time, a few more, which he had already completed, made their posthumous appearance in it, and, in subsequent years, some selections from his unpublished papers were through the care of Giebel presented to the public. Throughout the whole of this series the same marvellous industry and scrupulous accuracy are manifested, and attentive study of it will show how many times Nitzsch anticipated the conclusions of modern taxonomers. Yet over and over again his determination of the affinities of several groups even of European birds was disregarded; and his labours, being contained in a bulky and costly work, were hardly known at all outside of his own country, and within it by no means appreciated so much as they deserved— for even Naumann himself, who gave them publication, and was doubtless in some degree influenced by them, utterly failed to perceive the importance of the characters offered by the song-muscles of certain groups, though their peculiarities were all duly described and recorded by his coadjutor, as some indeed had been long before by Cuvier in his famous dissertation on the Thiers (Leçons d'anatomie comparée, iv. 430-431). Nitzsch's name was subsequently dismissed by Cuvier without a word of praise, and in terms which would have been applicable to many another and inferior author, while Temminck, terming Naumann's work an "ouvrage de luxe"— it being in truth one of the cheapest for its contents ever published—effectually shut it out from the realms of science. In Britain it seems to have been positively unknown until quoted some years after its completion by a catalogue-complier on account of some peculiarities of nomenclature which it presented.

Now we must return to France, where, in 1827, L'Herminier, a creole of Guadeloupe and a pupil of De Blainville's, contributed to the Actes of the Linnaean Society of Paris for that year (vi. 3-93) the "Recherches sur l'appareil sternal des Oiseaux," which the precept and example of his master had prompted him to undertake, and Cuvier had found for him the means of executing. A second and considerably enlarged edition of this very remarkable treatise was published as a separate work in the following year. We have already seen that De Blainville, though fully persuaded of the general value as a method of classification, had been compelled to fall back upon the old pedal characters so often employed before; but now the scholar had learnt to excel his teacher, and not only to form an at least provisional arrangement of the various members of the Class, based on sternal characters, but to describe these characters at length, and so give a reason for the faith that was in him. There is no evidence, so far as we can see, of his having been aware of Merrem's views; but like that anatomist he without hesitation divided the class into two great "compés," to which he gave, however, no other names than "Oiseaux normaux" and "Oiseaux anomaux"— exactly corresponding with his predecessor's Carinatae and Rotilae—and, moreover, he had a great advantage in founding these groups, since he had discovered, apparently from his own investigations, that the mode of ossification in each class was distinct; for hitherto the statement of there being five centres of ossification in every bird's sternum seems to have been accepted as a general truth, without contradiction, whereas in the ostrich and the rhea, at any rate, L'Herminier found that there were but two such primitive points, and from analogy he judged that the same would be the case with the cassowary and the emu, which, with the two forms mentioned above, made up the whole of the "Oiseaux anomalux" whose existence was then generally acknowledged. To secure the forms which composed the family previously termed Curoseres by De Blainville; but L'Herminier was able to distinguish no fewer than thirty-four families of "Oiseaux normaux," and the judgment with which their separation and definition were effected must be deemed on the whole to be most creditable to him. It is to be remarked, however, that the wealth of the Paris Museum, which he enjoyed to the full, placed him in a situation incomparably more favourable for arriving at results than that which was occupied by Merrem, to whom many of the most remarkable forms were wholly unknown, while L'Herminier had at his disposal examples of nearly every type then known to exist. But the latter used this privilege wisely and well—not, after the manner of De Blainville and others subsequent to him, relying solely or even chiefly on the character afforded by the posterior portion of the sternum, but taking also into consideration those of the anterior, as well as of the in some cases still more important characters presented by the pre-sternal bones, such as the furcula, coracoids and scapulae. L'Herminier thus separated the families of "Normal Birds:"—

1. "Accipitres"—Accipitres, Linn.;
3. "Chouettes"—Strix, Linn.
5. "Perroquets"—Psittacus, Linn.
8. "Engoulents"—Caprimulgus, Linn.
9. "Coucous"—Cuculus, Linn.
11. "Rolliers"—Galbula, Gerv.
12. "Guêpiers"—Merops, Linn.
15. "Toucans"—Ramphastos, Linn.
17. "Eophides"—Eophides, Linn.
18. "Passereaux"—Passeres, Linn.;
19. "Pigeons"—Columbus, Linn.
22. "Foulques ou Poules d'eau"— Fulica, Linn.
25. "Grallæ"—Grollæ, Linn.
27. "Pétrons"—Procilla, Linn.
29. "Canards"—Anas, Linn.
31. "Flamants"—Columbus, Latham.
32. "Pélicans"—Pelecanus, Linn.
33. "Mouettes"—Mellisuga, Linn.
34. "Manchots"—Aptenodytes, Forster.

The preceding list is given to show the very marked agreement of L'Herminier's results compared with those obtained fifty years later by another investigator, who, without attaching the subject from an entirely different, though still osteological, basis. Many of the excellencies of L'Herminier's method could not be pointed out without too great a sacrifice of space, because of the details into which it would be necessary to enter; but the trenchant way in which he showed that the "Passereaux"—a group of which Cuvier had said, "Son caractère semble d'abord purement négatif," and had then failed to define the limits— differed so completely from every other assemblage, while maintaining among its own innumerable members an almost perfect essential homogeneity, is very striking, and shows how admirably he could grasp his subject. Not less conspicuous are his merits in disposing of the groups of what are ordinarily known as water-birds, his indicating the affinity of the rails (No. 22) to the cranes (No. 23), and the severing of the latter from the herons (No. 24). His union of the stipes, sandpipers and plovers into one group (No. 26) and the alliance, especially dwelt upon, of that group with the gulls (No. 27) are steps which, though indicated by Merrem, are here for the first time clearly laid down; and the separation of the gulls from the petrels (No. 28)—step in advance already taken; it is true, by Illiger—is here placed on indefeasible ground. With all this, perhaps on account of all this, L'Herminier's efforts did not

1 Cuvier's first observations on the subject seem to have appeared in the Magasin encyclopédique for 1795 (ii. pp. 330, 358).
2 This fact in the ostrich appears to have been known already to Geoffroy St-Hilaire from his own observation in Egypt, but does not seem to have been published by him.
find favour with his scientific superiors, and for the time things remained as though his investigations had never been carried on.

Two years later Nitzsch, who was indefatigable in his endeavour to discover the natural families of birds and had been pursuing a series of researches into their vascular system, published the result at Halle in Saxony, in his *Observations de avium arteriae carotides communiae*, in which is included a classification drawn up in accordance with the variation of structure which that important vessel, and it may be more expedient here to name the different groups which he thus thought himself entitled to consider established. They are as follows:

I. **AVES CARINATAE** [L’H. “Oiseaux normaux”]

A. **AVES CARINATAE** aerea e.

B. **AVES CARINATAE** terrestres.

C. **AVES CARINATAE** aquatica e.

Grallae.

Palmata.

II. **AVES RATITEAE** [L’H. “Oiseaux anormaux”].

To enable the reader to compare the several groups of Nitzsch with the families of L’Herminier, the numbers applied by the latter to his families are suffixed in square brackets to the names of the former. The arrangement of the order of sequence, which is here immaterial, the essential correspondence of the two systems is worthy of all attention, for it obviously means that these two investigators, starting from different points, must have been on the right track, when they so often coincided as to the limits of what they considered to be, and what we are now almost justified in calling, natural groups. But it must be observed that the classification of Nitzsch, just given, rests much more on characters furnished by the general structure than on those furnished by the cartilaginous only. Among all the species (188), he tells us, in number of which he examined specimens, he found only four variations in the structure of that vessel, namely:

1. That in which both a right carotid artery and a left are present. This is the most usual fashion among the various groups of birds, including all the “aerial” forms excepting *Passerinae*, *Macrochires* and *Picinae*.

2. That in which there is but a single carotid artery, springing from both right and left trunk, but the branches soon coalescing, to take a midway course, and again dividing near the head. This form Nitzsch was only able to find in the bittern (*Ardea stellersii*).

Whether Nitzsch was cognizant of L’Herminier’s views is in no way demonstrable; his name cannot be even mentioned by him, but Nitzsch was in Paris in the summer of 1827, and it is almost impossible that he should not have heard of L’Herminier’s labours, unless the relations between the followers of Cuvier to whom Nitzsch attached himself, and those of De Geerinville, whose pupil L’Herminier was, were such as to forbid any communication between the rival schools. Yet we have L’Herminier’s evidence that Cuvier gave him every assistance. Nitzsch’s silence, both on this occasion and afterwards, is very curious; but he cannot be accused of plagiarism, for the scheme given above is only an amplification of that foreshadowed by him (as already mentioned) in 1820—a scheme which seems to have been equally unknown to L’Herminier, perhaps through linguistic difficulty.

3. That in which the right carotid artery alone is present, of which, according to our author’s experience, the flamingo (*Phoenicopterus*) was an example.

That in which the left carotid artery alone exists, as found in all other birds examined by Nitzsch, and therefore as regards species and individuals much the most common—since into this category come the countless thousands of the passerine birds—a group which outnumbers all the rest put together.

Considering the enormous stride in advance made by L’Herminier, it is very disappointing for the historian to have to record that the next inquirer into the osteology of birds achieved a disastrous failure in his attempt to throw light on their arrangement—much more of classification of their system. This was Berthold, who devoted a long chapter of his *Beitrag zur Anatomie*, published at Göttingen in 1831, to a consideration of the subject. So far as his introductory chapter went—the development of the sternum—he was, for his time, right enough and somewhat instinctively. It was after a close examination of the sternal apparatus of one hundred and thirty species, which he carefully described, that he arrived (pp. 177-183) at the conclusion—astonishing to us who know of L’Herminier’s previous results—that the sternum of birds cannot be used as a help to their classification on account of the egregious anomalies that would follow the proceeding such anomalies, for instance, as the separation of *Cypselus* from *Hirundo* and its alliance with *Trochilus*, and the grouping of *Hirundo* and *Pringilla* together. At the very beginning of the year 1832 Cuvier laid before the *Academy of Sciences of Paris* a memoir on the progress of ossification in the sternum of birds, of which memoir an abstract will be found in the *Annales des sciences naturelles* (xxv. pp. 260-272). Herein he traced in detail, illustrating his statements by the preparations he exhibited, the progress of ossification in the sternum of the fowl and of the duck, pointing out how it differed in each, and giving his interpretation of the differences. It had hitherto been generally believed that the mode of ossification in the fowl was that which obtained in all birds—the ostrich and its allies (as L’Herminier, we have seen, had already shown) excepted. But it was now made to appear that the struthious birds in this respect resembled, not only the duck, but a great many other groups—waders, birds-of-prey, pigeons, passerines and perhaps all birds not gallinaceous—so that, according to Cuvier’s view, the five points of ossification observed in the Gallinae, instead of exhibiting the normal process, exhibited one quite exceptional, and that in all other birds, so far as he had been enabled to investigate the matter, ossification of the sternum began at two points only, situated near the anterior upper margin of the side of the sternum, and gradually crept towards the keel, into which it presently extended; and, though he allowed the appearance of the points of calcareous deposit in ducks at a certain age, he seemed to consider this individual peculiarity. This fact was fastened upon by Geoffroy in his reply, which was a week later presented to the Academy, but was not published in full until the following year, when it appeared in the *Annales du Muséum* (ser. 3, ii. pp. 1-22).

Geoffroy here maintained that the five centres of ossification existed in the duck just as in the fowl, and that the real difference of the process lay in the period at which they made their appearance, a circumstance which, though virtually proved by the preparations Cuvier had used, had been by him overlooked or misinterpreted. The fowl possesses all five ossifications at birth, and for a long while the middle piece forming the keel is by far the largest. They all grow slowly, and it is not until the animal is about six months old that they are united into one firm bone. The duck, on the other hand, when newly hatched, and for nearly a month after, has the sternum wholly cartilaginous. Then, in true, two lateral points of ossification appear at the margin, but subsequently the remaining three are developed, and when once formed they grow with much greater rapidity than in the fowl, so that by the time the young duck is quite independent of its parents, and can shift for itself, the whole sternum is completely bony. Nor, argued Geoffroy, was it true to say, as Cuvier had said, that the like occurred in the pigeons and true passerines. In their case the sternum begins to ossify from three very distinct points—one of which is the centre of ossification of
the keel. As regards the struthious birds, they could not be likened to the duck, for in them at no age was there any indication of a single growth of this bone which in the adult bird had already reached a size good for the purpose.

The points at issue between Cuvier and Étienne Geoffroy St-Hilaire before mentioned naturally attracted the attention of L'Herminier, who in 1836 presented to the French Academy and Academy of Sciences of that country a report on the results of his investigations into the mode of growth of the keel bone in the adult bird he had already studied, so much the better, as the latter's full account of his diligent investigations was never published. We can best judge of his labours from an abstract reprinted in the Comptes rendus (iii. pp. 12-20) and reprinted in the Annales des sciences naturelles (ser. 2, vol. vi. pp. 107-115), and from the report upon them by Isidore Geoffroy-St-Hilaire, to whom with others they were referred. This report is contained in the Comptes rendus for the following year (iv. pp. 565-574), and is very critical in its character.

L'Herminier arrived at the conclusion that, so far from there being any proof or indication of a single growth of ossification in the sternum as carried on, the number of different modes is very considerable—almost each natural group of birds having its own. The principal theory which he hence conceived is justified in the following words: "As (unto the one being as had been stated) the maximum number of centres of ossification in the sternum, there are no fewer than nine entering into the composition of the perfect sternum of birds in general, though in every some or other nine are wanting, whatever be the condition of development at the time of ossification the same number of ossification centres or "pieces" L'Herminier deemed to be disposed in three transverse series (rangées), namely the anterior or "prosternal", the middle or "mesosternal" and the posterior or "metasternal"—each series consisting of three portions, one median piece and two side-pieces. At the same time he seems, according to the abstract of his memoir, to have made some very contradictory assertion that sometimes there are more than three pieces in each series, and sometimes more of birds as many as six. It would occupy more space than can here be allowed to give even the briefest abstract of the numerous observations which follow the statement of his theory and on which it professedly rests. They extend to more than a thousand observations, grouped so as to present some peculiar characteristics. Thus of the first series of pieces he says that when all exist they may be developed simultaneously, or that the two side pieces may precede the median, or again that the posterior pieces may precede according to the group of birds, but that the second mode is much the more general. Further variations are observable in the second or middle series, but side-pieces are said to exist in all groups of birds without exception. The third or posterior series, when it is complete the three constituent pieces are developed almost simultaneously; but its median piece is said often to originate in two, which soon unite, especially when the side-pieces are wanting. By way of examples of L'Herminier's observations, what he says of the two groups that immediately succeed to the subject of Cuvier and the elder Geoffroy's contest may be mentioned. In the Gallinae the five well-known pieces or centres of ossification are said to consist of the two side-pieces of the second or middle series, and the three of the posterior. On two occasions however he observed the median piece, now taken for a representation of the first series, a little "noyau" situated between the coracoids—forming the only instance of all three series being present in the same bird. As regards the ducks, L'Herminier says that those of the same order, but with Cuvier that there are essentially two centres of ossification—the side-pieces of the middle series; but these grow to meet one another a distinct median "noyau," also of the same series, sometimes appears, which soon forms a connexion with each of the others. In the Oscines the same trace of this median centre of ossification ever occurs; but with this exception its existence is invariable in all other birds. Here the matter must be left; but it is undoubtedly a subject which demands further investigation, and finally by any future investigator it should consult the abstract of L'Herminier's memoir and the criticisms upon it of the younger Geoffroy.

Hitherto our attention has been given wholly to Germany and France, for the chief ornithologists of Britain were occupying themselves at this time in a very isolated way, but that there were several distinguished men who were paying due heed at this time to the internal structure of birds, and some excellent descriptive memoirs on special forms had appeared from their pens, to say nothing of more than one general treatise on ornithic anatomy. Yet no one in Britain

---

1 See from Oen's Naturgeschichte für Schulen, published in 1821, but the division is to be found in that author's Lehrbuch der Zoologie (ii. p. 371), which appeared in 1816.

2 Macgillivray.
seems to have attempted to found any scientific arrangement of birds on other than external characters until, in 1837, William Macgillivray issued the first volume of his History of British Birds, wherein, though professing (p. 19) "not to set up a new system to the many already in partial use, or that have passed away like their authors," he propounded (pp. 16-18) a scheme for classifying the birds of Europe at least founded on a "consideration of the digestive organs, which merit special attention, on account, not so much of their great importance in the economy of birds, as the nervous, vascular and other systems are not behind them" in this respect; but because, exhibiting great diversity of form and structure, in accordance with the nature of the food, they are more obviously qualified to afford a basis for the classification of the numerous species of birds" (p. 52). Fuller knowledge has shown that Macgillivray was ill-advised in laying stress on the systematic value of adaptive characters, but his contributions to anatomy were valuable, and later investigators, in particular H. Gadow and P. Chalmers Mitchell, have shown that useful systematic information can be obtained from the study of the alimentary canal. Macgillivray himself it was, apparently, who first detected the essential difference of the organs of voice presented by some of the New-World Passerines (subsequently known as Clamatorides), and the earliest intimation of this seems to be given in his anatomical description of the Arkansas Flycatcher, Tyrannus verticalis, which was published in 1836 (Ornitol. Biograph., v. 42, p. 67). It must be admitted that he did not—because he then could not—perceive the bearing of their difference, which was reserved to be shown by the investigation of a still greater anatomist, and of one who had fuller facilities for research, and thereby almost revolutionized, as will presently be mentioned, the views of systematists as to this order of birds. There is only space here to say that the second volume of Macgillivray's work was published in 1839, and the third in 1840; but it was not until 1852 that the author, in broken health, found an opportunity of issuing the fourth and fifth. His scheme of classification, being as before stated partial, need not be given in detail. Its great merit is that it proved the necessity of combining another and hitherto much-neglected factor in any natural arrangement, although vitiated as so many other schemes have been by being based wholly on one class of characters.

But a bolder attempt at classification was that made in 1838 by Blyth in the New Series (Charleworth's) of the Magazine of Natural History (ii. pp. 256-268, 314-319, 351-361, 420-426, 586-601; iii. pp. 76-84). It was limited, however, to what he called Passores, being the group upon which that name had been conferred by Vigors (Trans. Linn. Soc. London, iv. 1822, p. 215), and drawn from external characters only. The classification of this order, as it is known to us now, was drawn from the evidence of Raphores, and it will be unnecessary to enter into particulars concerning it, though it is as equally remarkable for the insight shown by the author into the structure of birds as for the philosophical breadth of his view, which comprehends almost every kind of character that had been at that time brought forward. It is plain that Blyth saw, and perhaps he was the first to see it, that geographical distribution was not unimportant in suggesting the affinities and differences of natural groups (pp. 258, 259); and, under the precepts and practice of the hitherto dominant English school of Ornithologists, he declared that "anatomy, when aided by every character which the manner of propagation, the progressive changes, and other physiological data supply, is the only sure basis of classification." He was quite aware of the taxonomic value of the vocal organs of some groups of birds, presently to be especially mentioned, and he had himself ascertained the presence and absence of caeca in a not inconsiderable number of groups, drawing thence very justifiable inferences. He knew at least the earlier investigations of L'Herminier, and, though the work of Nitzsch, even if he had ever seen it (in many instances through ignorance of the language in which it was written) had been to him a sealed book, he had followed out and extended the hints already given by Temminck as to the differences which various groups of birds display in their moult. With all this it is not surprising to find, though the fact has been generally overlooked, that Blyth's proposed arrangement in many points anticipated conclusions that were subsequently reached, and were then regarded as fresh discoveries. It is proper to add that at this time the greater part of his work was carried on in conjunction with A. Bartlett, the superintendent of the London Zoological Society's Gardens, and that, without his assistance, Blyth's opportunities, slenderness as they were compared with those which others have enjoyed, must have been still smaller. Considering the extent of their materials, which was limited to the bodies of such animals as they could obtain from dealers and the several menageries that then existed in or near London, the progress made in what has since proved to be the right direction is very wonderful. It is obvious that both these investigators had the genius for recognizing and interpreting the value of characters; but their labours do not seem to have met with much encouragement; and a general arrangement of the class laid by Blyth before the Zoological Society at this time 1 does not appear in its publications. The scheme could hardly fail to be a crude performance—a fact which nobody would know better than its author; but it must have presented much that was objectionable to the opinions then generally prevalent. Its line to some extent may be partly made out—very clearly, for the matter of that, so far as its details have been published in the series of papers to which reference has been given—and some of the analyses and comparisons are, even to the present day, treated of in the Zoological Society's Proceedings in connection with the specimens of birds in the museum of the Asiatic Society of Bengal, which, after several years of severe labour, made its appearance at Calcutta in 1849; but, from the time of his arrival in India, the onerous duties imposed upon Blyth, together with the want of sufficient books of reference, seem to have hindered him from seriously continuing his former researches, which, interrupted as they were, and born out of due time, had no appreciable effect on the views of systematists generally.

Next must be noticed a series of short treatises communicated by Johann Friedrich Brandt, between the years 1836 and 1839, to the Academy of Sciences of St. Petersburg, and published in its Mémoires. In the year last mentioned the greater part of these was privately issued under the title Beiträge zur Kenntniss der Natursgeschichte der Vögel. Herein the author first assigned anatomical reasons for rearranging the order Anseres of Linnaeus and Nataires of Illiger, who, so long before as 1811, had proposed a new division of it into six families, the definitions of which, as was his wont, he had drawn from external characters only. Brandt now obtained nearly very nearly the same arrangement as his predecessor; but, notwithstanding that he could trust to the former foundation of internal framework, he took at least two retrogrades. First, he did not distinguish between the penguins (which Illiger had placed as a group, Impennes, of equal rank to his other families) and the auks, divers and grebes, Pygopodes—combining all of them to form a "Typus" (to use his term) Utrinque; and secondly he admitted among the Passeres, though as a distinct "Typus" Podidae, the genera Podoa and Fulica, which are now known to belong to the Railidae—the latter indeed (see Coot) being but very slightly removed from the moorhen. At the same time he corrected the error of Blyth in associating the Phalaropes with these forms, rightly declaring their relationship to Tringa (see Sandpiper), a point of order which other systematists were long in admitting. On the whole Brandt's labours were but moderately valuable, and the consideration must be paid to osteology: for his position was such as to gain more attention to his views than some of his less favourably placed brethren had succeeded in doing.

A somewhat more advanced work was made in the classification of the true Passerines. Keyserling and Blasius briefly pointed out in the Archiv für Naturgeschichte (v. pp. 332-334) that, while all the other birds provided with perfect wing-muscles had the "planta" or hind part of the "baseis" covered with feathers, the passerines, the larks (g.s.) had this part divided by many transverse sutures, so as to be scutellated behind as well as in front; just as is the case in many of the passerines which have not the singing-wings of a different class, as in the hoopoe (g.s.). The importance of this singular but superficial departure from the normal structure has been so needlessly exaggerated as a character that at the present time its value is apt to be unduly depreciated. In so large and so homogeneous a group as that of the true Passerines, a constant

1 An abstract is contained in the Minute-book of the Scientific Meetings of the Zoological Society, 26th June and 10th July 1838. The class was to contain fifteen orders, but only three were dealt with in any detail.
character of this kind is not to be despised as a practical mode of separating the birds which possess it; and, more than this, it would appear that the discovery thus announced was the immediate means of leading to a series of investigations of a much more important and lasting nature—that of Johannes Müller to be presently mentioned.

Again we must recur to that indefatigable and most original investigator Nitzsch, who, having never interrupted his study of the particular subject of his first contribution to science, long ago noticed, in 1833 brought out at Halle, where he was professor of Zoology, an essay with the title *Pterylographiae Asias Pars prior*. It seems that this was issued as much with the object of inviting assistance from others in view of future labours, since the materials at his disposal were comparatively scanty, as with that of making known the results to which his researches had already led him. Indeed, he only communicated copies of this essay to a few friends, and examples of it are comparatively scarce. Moreover, he stated subsequently that he thereby hoped to excite other naturalists to share with him the investigations he was making on a subject which had hitherto escaped notice or had been wholly neglected, since he considered that he had proved the disposition of the feathered tracts in the plumage of birds to be the means of furnishing characters for the discrimination of the various natural groups as significant and important as they were new and unexpected. There was no need for us here to quote this essay in its chronological place, since it dealt only with the generalities of the subject, and did not enter upon any systematic detailed subject, the author reserved for a second and a third book what was destined never to complete. He kept on diligently collecting materials, and as he did so was constrained to modify some of the statements he had published. He consequently fell into a state of doubt, and before he could make up his mind on some questions which he deemed important he was overtaken by death.

Burmeister, his friend and successor Professor Burmeister, now and for many years past of Buenos Aires, who, with much skill, elaborated from them the excellent work known as Nitzsch's *Pterylographie*, which was published at Halle in 1840, and translated into English for the Ray Society in 1867. There can be no doubt that Professor Burmeister discharged his editorial duty with the most conscientious scrupulosity; but, from what has been just said, it is certain that there were important points on which Nitzsch was as yet undecided—some of them perhaps of which no trace appeared in his manuscripts, and therefore as in every case of works posthumously published, unless (as rarely happens) they have received their author's "imprimatur," they cannot be implicitly trusted as the expression of his final views. It would consequently be unsafe to ascribe positively all that appears in this volume to the result of Nitzsch's mature consideration. Moreover, as Professor Burmeister states in his preface, Nitzsch by no means regarded the natural sequence of groups as the highest problem of the systematist, but rather their correct limitation. Again, the arrangement followed in the *Pterylographie* was of course based on pterylographical considerations, and we have its author's own word for it that he was persuaded that the limitation of natural groups could only be attained by the most assiduous research into the species of which they are composed from every point of view. The combination of these three facts will of itself explain some defects, or even retrogressions, observable in Nitzsch's later systematic work when compared with that which he had formerly done. On the other hand, some manifest improvements are introduced, and the abundance of details into which he enters in his *Pterylographie* render it far more instructive and valuable than the older performance. As an abstract of that has already been given, it may be sufficient here to point out the chief changes made in his newer arrangement. To begin with,

Though not relating exactly to our present theme, it would be improper to dismiss Nitzsch's name without reference to his extraordinary labours in investigating the insect and other external parasites of birds, a subject which as regards British species was subsequently elaborated by Denny in his *Monographia Anaplastorium Britanniae* (1842) and in his list of the specimens of British Anaplas in the collection of the British Museum.

The three great sections of aerial, terrestrial, and aquatic birds are abolished. The "Accipites" are divided into two groups, Diurnal and Nocturnal; but the first of these divisions is separated into two sections: (1) the Vultures of the New World, (2) those of the Old World, and (3) the genus Falco of Linnaeus. The "Passerines," that is to say, the true Passers, are split into eight families, not wholly with judgment, but of their taxonomy more is to be said presently. Then a new order "Picariae" is instituted for the reception of the families Picinae, Picidae, Psittacidae, and Amphilidae of his old arrangement, to which are added three others—Caprimulgidae, Todidae, and Lipophognae—the last consisting of the genera Bucerus, U. p. and Alcedo. The association of Alcedo with the other two is no doubt a misplacement, but the alliance of Bucerus to U. p. is already suggested by Gould and Blyth in 1838 (Mag. Nat. History, ser. 2, ii. pp. 422 and 589), though apparently unnatural, has been corroborated by many later systematists; and as a whole the establishment of the Picariae was certainly a commendable proceeding. For the rest there is only one considerable change, and that forms the greatest blot on the whole scheme. Instead of recognizing, as before, a subclass in the Rattiae of Merrem, Nitzsch now reduced them to the rank of an order under the name "Platysaenae," placing them between the "Galinaeae" and "Grallae," though admitting that in their pterylosia they differ from all other birds, in ways that he is at great pains to describe, in each of the four genera examined by him—Struthio, Rheas, Dromaeus, and Ostriches. It is significant of the standing of this new order that he did not figure the pterylosis of any one of them, and the thought suggests itself that, though his editor assures us he had convinced himself that the group must be here shoved in ('eingeschoben' is the word used), the intrusion is rather due to the necessity which Nitzsch, in common with most men of his time (the Quinarians excepted), felt for deploying the whole series of birds into line, in which case the proceeding may be defensible on the score of convenience. The extraordinary merits of this book, and the admirable fidelity to his principles which Professor Burmeister showed in the difficult task of editing it, were unfortunately overlooked for many years, and perhaps are not sufficiently recognised now. Even in Germany, the author's own country, there were few to notice seriously what is certainly one of the most remarkable works ever published on the science, much less to pursue the investigations that had been so laboriously begun. Andreas Wagner, in his report on the progress of the systematics, has accused Nitzsch of misusing his own name and of having been the first to discover the "imprimatur"; they cannot be implicitly trusted as the expression of his final views. It would consequently be unsafe to ascribe the work to the result of Nitzsch's mature consideration. Moreover, as Professor Burmeister states in his preface, Nitzsch by no means regarded the natural sequence of groups as the highest problem of the systematist, but rather their correct limitation. Again, the arrangement followed in the "Pterylographie" was of course based on pterylographical considerations, and we have its author's own word for it that he was persuaded that the limitation of natural groups could only be attained by the most assiduous research into the species of which they are composed from every point of view. The combination of these three facts will of itself explain some defects, or even retrogressions, observable in Nitzsch's later systematic work when compared with that which he had formerly done. On the other hand, some manifest improvements are introduced, and the abundance of details into which he enters in his "Pterylographie" render it far more instructive and valuable than the older performance. As an abstract of that has already been given, it may be sufficient here to point out the chief changes made in his newer arrangement. To begin with,
ornithology, as might be expected from such a man as he was, placed the *Pierioptera* at the summit of those publications the appearance of which he had to record for the years 1839 and 1840, and which, for "Systematics" it was of the greatest importance. On the other hand Oken (*Jsis*, 1842, pp. 156-234), though giving a summary of Nitzsch's results and classification, was more sparing of his praise, and prefaced his remarks by asserting that he could not refrain from laughter when he looked at the plates in Nitzsch's work, since they reminded him of the plucked fowls hanging in a poulterer's shop, and goes on to say that, as the author always had the luck to engage in researches of which nobody thought, so had he the luck to print them where nobody sought them. In Sweden Sundevall, without accepting Nitzsch's views, accorded them a far more appreciative greeting in his annual reports for 1840-1842 (i.e. pp. 132-160); but, of course, in England and France2 nothing was known of them beyond the scantiest notice, generally taken at second hand, in two or three publications. Thanks to Mr Sclater, the Ray Society was induced to publish, in 1867, an excellent translation by Mr Dallas of Nitzsch's *Pierioptera*, and thereby, however tardily, justice was at length rendered by British ornithologists to one of their greatest foreign brethren.3

Nitzsch's work on feathers has been carried farther by many later observers, and its value is now generally accepted (see Feather). There is no need, here, to go into further detail for the present, beyond the fact that the peculiarities of the feathers, as exhibited by the quills, the barbs, and the barbules, are essentially natural, and that in this respect they are no less real; and that the quills and quill-like structures found in the systematist's need to look beneath the integument, even in parts that are comparatively little hidden as birds' feet, is once more made beyond all question apparent.

It has already been mentioned that Macgillivray contributed to Audubon's *Ornithological Biography* a series of descriptions of some parts of the anatomy of American birds, from subjects supplied to him by that enthusiastic naturalist, whose zeal and prescience, it may be called, in this respect, formed the ground-work for the systematist's need to look beneath the integument, even in parts that are comparatively little hidden as birds' feet, is once more made beyond all question apparent.

It is generally admitted that Macgillivray published an account of the anatomy of American birds, from subjects supplied to him by that enthusiastic naturalist, whose zeal and prescience, it may be called, in this respect, formed the ground-work for the systematist's need to look beneath the integument, even in parts that are comparatively little hidden as birds' feet, is once more made beyond all question apparent.

The first of this series of anatomical descriptions appeared in the fourth volume of his work, published in 1838, but they were continued until its completion with the fifth volume in the following year, and the whole was incorporated into what may be termed its second edition, *The Birds of America*, which appeared between 1840 and 1844. Among the many species whose anatomy Macgillivray thus partly described from autopsy were at least half a dozen[1] of those now referred to the family Tyrannidae (see King-Robinson, 1849), and (as before mentioned) *T. verticalis*, *Myiarchus crinitus*, *Sayanornis fuscus*, *Contopus venos* and *Empidonax acadicus* (as well as many others, according to the irrational, vague and rudimentary notions of classification of the time, in what was termed the family)4 *Muscinæa*5. In all these species he found the vocal organs to differ essentially in structure from those of other birds of the Old World, which work is now called Passerine, or, to be still more precise, Oscinean. But by him these last were most arbitrarily severed, dissociated from their allies, and wrongly combined with other forms by no means nearly related to them (Brut. Birds, i. pp. 17-18) which he also examined; and he practically, though not literally,6 asserted the truth, when he said that the general structure, but especially the muscular appendages, of the lower larynx was "similarly formed in all other birds of this family"7 described in Audubon's work. Macgillivray did not, however, assign to this essential difference any systematic value. Indeed he was so much prepossessed in favour of a classification based on the structure of the digestive organs that he could not bring himself to consider vocal muscles to be of much taxonomic use, and it was reserved to Johannes Müller to point out that the contrary was the fact. This the great German comparative anatomist did in two communications to the Academy of Sciences of Berlin, one on the 26th June 1845 and the other on the 14th May 1846, which, having been first briefly published in the Academy's *Monatsbericht*, were afterwards printed in full, and of which I have been led by his successors, in his *Abhandlungen*, though in this latter and complete form the most important parts (pp. 391-394) it has been possible to quote until 1847.7

This very remarkable treatise forms the groundwork of almost all later or recent researches in the comparative anatomy and consequent arrangement of the *Passeres*, and, though it is certainly not free from imperfections, many of them, it must be said, arise from want of material, notwithstanding that its author had command of a much more abundant supply than was at the disposal of Nitzsch. Carrying on the work from the anatomical point at which he had left it, correcting his errors, and utilizing to the fullest extent the observations of Keyserling and Blasius, to which reference has already been made, Müller, though hampered by mistaken notions of which he seems to have been unable to rid himself, propounded a scheme for the classification of this group, the general truth of which has been admitted by all his successors, based, as the title of his treatise expressed, on the hitherto unknown different types of the vocal organs in the Passerines. He freely recognized the prior discoveries of, as he thought, Audubon, though really, as has since been ascertained, of Macgillivray; but Müller was able to perceive their systematic value, which Macgillivray had failed to, and taught others to know it. At the same time Müller showed his conspicuous assumption notwithstanding, to fall behind Nitzsch in one very crucial point, for he refused to the latter's *Picariae* the rank that had been claimed for them, and imagined that the groups associated under that name formed but a third "tribe"—*Picarii*—of a great order *Insessores*, the others being (1) the *Oscines* or *Polyptychus*—the singing birds by emphasis, whose inferior larynx was endowed with the full number of five pairs of song-muscles, and (2) the *Tachyptophores*, composed of some South-American families. Looking on Müller's labours as we now can, we see that such errors as those committed are chiefly due to his want of special knowledge of ornithology, combined with the absence in several instances of sufficient materials for investigation. Nothing whatever is to be said against the composition of his first and second "tribes"; but the third is an assemblage still more heterogeneous than that which Nitzsch brought together under a name so like that of Müller—for the fact must never be allowed to go out of sight that the extent of the *Picarii* of the latter is not at all that of the *Picariae* of the former8.

For it is not needless to point out this fine distinction, for more than one modern author would seem to have overlooked it.
instance, Müller places in his third "tribe" the group which he called *Amphiloes*, meaning thereby the peculiar forms of South America that are now considered to be more properly named *Cotingidae*, and herein he was clearly right, while Nitzsch, who (mired by their supposed affinity to the genus *Amphiloes*—peculiar to the Northern Hemisphere, and a purely Passerine form) had kept them among his *Passerinae*, was as clearly wrong. But again Müller made his third "tribe" *Picarri* also to contain the *Tyrannidae*, of which mention has just been made, though it is so obvious as now to be generally admitted that they have no very intimate relationship to the other families with which they are there associated. There is no need here to criticise more minutely this projected arrangement, and it must be said that, notwithstanding his researches, he seems to have had some misgivings that, after all, the separation of the *Insectores* into those "tribes" might not be justifiable. At any rate he wavered in his estimate of their taxonomic value, for he gave an alternative proposal, arranging all the genera in a single series, a proceeding in those days thought not only defensible and possible, but desirable or even requisite, though now utterly abandoned. Just as Nitzsch had laboured under the disadvantage of never having any example of the abnormal *Passeres* of the New World to dissect, and, therefore, was wholly ignorant of their abnormality, so Müller never succeeded in getting hold of an example of the genus *Pitta* for the same purpose, and yet, acting on the clue furnished by Keyserling and Blasius, he did not hesitate to predict that it would be found to fill one of the gaps he had to leave, and this to some extent it has been since proved to do.

It must not be supposed that the vocal muscles were first discovered by Müller; on the contrary, they had been described long before, and by many writers on the anatomy of birds. To say nothing of foreigners, or the authors of general works on the subject, an excellent account of them had been given to the Linnean Society by W. Yarrell in 1820, and published with elaborate figures in its Transactions (xvi. 305-321, pls. 17, 18), an abstract of which was subsequently given in his "History of British Birds," and Macgillivray also described and figured them with the greatest accuracy ten years later in his work with the same title (ii. 21-37, pls. x-xii.), while Blithy and Nitzsch had (as already mentioned) seen some of their value in classification. But Müller has the merit of clearly outstanding his predecessors, and with his accustomed perspicacity made the way even plainer for his successors to see than he himself was able to see it. What remains to add is that the extraordinary celebrity of its author actually procured for the first portion of his researches notice in England (Ann. Nat. History, xvii. 490), though it must be confessed not then to any practical purpose; but more than thirty years after there appeared an English translation of his treatise by F. Jeffrey Bell, with an appendix by Garrod containing a summary of the latter's own continuation of the same line of research.1

It is now necessary to revert to the year 1842, in which Dr. Cornay of Rochefort communicated to the French Academy of Sciences a memoir on a new classification of birds, of which, however, nothing but a notice has been preserved (Comptes rendus, xiv. p. 164). Two years later this was followed by a second contribution by the same author, in which several of his conclusions appeared in the official organ of the Academy (sit supra, xvi. pp. 95, 95), though an abstract was inserted in one scientific journal (L'Institut, xii. p. 21), and its first portion in another (Journal des Deux Mondes, March 1843). This work, which contained the whole, and enabled naturalists to consider the merits of the author's project, which was to found a new classification of birds on the form of the anterior palatal bones, which he declared to be the character on which the proper classification of the families has to be founded, has always been placed in certain fixed laws. These laws were formulated by him, are that (1) there is a coincidence of form of the anterior palatal and of the cranium in birds of the same order; (2) there is a likeness between the anterior palatal bones in birds of the same order; (3) there are relations of likeness between the anterior palatal bones in groups of birds which are near to one another. These laws, he added, exist in regard to all parts that offer characters fit for the methodical arrangement of birds, but it is in regard to the anterior palatal bone that they were probably most evident. In the evolution of these laws Dr. Cornay had more labour, and his position has been proved, a vast number of different types, and the upshot of his whole labours, though not very clearly stated, was such as to wholly subvert the classification at that time generally adopted by French ornithologists. He of course of course is subjected to the same criticism as Müller and De Blainville on eternal formation, and he also seems to have been aware of some pterylogically differences exhibited by birds—whether those of Nitzsch or those of Jacquinot is not stated. True palatal bones were never preserved in the wrong way, and it is perfectly possible that Dr. Cornay may have known their drift. Be that as it may, he declares that characters drawn from the sternum or the pelvis—hitherto deemed to be, next to the bones of the head, the most important that any ornithologist had been worth, more, from a classificatory point of view, than characters drawn from the bill or the legs; while pterylogically considerations, together with many others to which some systematists had attached unreasonably importance, and apparently must never be taken to control, the force of evidence furnished by this bone of all bones—the anterior palatal. That Dr. Cornay was on the brink of making a discovery of considerable magnitude, we think, cannot be doubted. He was led to regard his investigations favourably, it cannot be said that he accomplished it. Whatever proofs Dr. Cornay may have had to satisfy himself of his being on the right track, these proofs were not sufficient to persuade any skilful man to the belief that he had accomplished it for the views—for it was a generation whose leaders, in France at any rate, looked with suspicion upon any one who professed to go beyond the species which the genius of Cuvier had been unable to overpass, and regarded the notion of upsetting any natural scheme propounded by him as verging almost upon profanity. Moreover, Dr. Cornay's scheme was not given to the world with any of those adjuncts that now, and so unfortunately, are of so little utility. Further examination also revealed the fact that in certain groups the number of "primaries," or quill-feathers growing from the manus or distal segment of the wing, formed another characteristic easy of observation. This was discovered by the French, Polydori of Müller the number was either nine or ten—and if the former, the bird was generally very small. In two of the other groups of which Professor Cabanis especially treated—groups which had been hitherto more or less condemned with the Oiseaux—the number of primaries was invariably nine, and the bird usually weaker than the species. This observation was also hailed as the discovery of a fact of extraordinary importance; and, from the results of these investigations, taken altogether, ornithology was declared by Sundevall, unreasonably improved by the system of Müllers, and the system was made greater progress than had been achieved since the days of Cuvier. The final disposition of the "Sub-class Insectes"—all the

1 The title of the English translation is Johannes Muller on Certain Variations in the Vocal Organs of the Passerines that have hitherto escaped notice. It was published at Oxford in 1878. By some unaccountable accident, the date of the original communication to the Academy of Berlin is wrongly printed. It has been rightly given above.

2 On the other hand, Müller makes several references to the labours of Professor Cabanis. The investigations of both authors must have proceeding simultaneously, and it matters little which actually appeared first.

3 This seems to have been made known by Professor Cabanis the preceding year to the Gesellschaft der Naturforschender Freunde (cf. Müller, Stimmenorgane der Pterois, p. 65). Of course the variation to which the number of primaries was subject had not escaped the observation of Nitzsch, but he had scarcely used it as a classificatory character.
ORNITHOLOGY [TAXONOMY]

perching birds, that is to say, which are neither birds of prey nor pigeons—proposed by Professor Cabanis, was into four "Orders," as follows:—

1. Ostrinae, equal to Miller's group of the same name;
2. Monotremata, that is to say, the majority of the division of the Picae, so called by Andreas Wagner, in 1834,1 which have their feet perfectly constructed;
3. Strisores, a group now separated from the Clamatores, and containing those forms which have their feet abnormal.
4. Scansores, being the Grimpers of Cuvier, the Zygoclasty of several other systematists.

The first of these four "Orders" had been already indefeasibly established one naturally perfect, but its details more must presently be said. The remaining three are now seen to be obviously artificial associations, and the second of them, Clamatores, in particular, containing a very heterogeneous assemblage of forms; but we are told that the interrelationships of some of them was at that time still more imperfectly known than now.

This will perhaps be the most convenient place to mention another kind of classification of birds, which, based on a principle wholly different, was of the greatest importance. The system of Bonaparte, requires a few words, though it has not been productive, nor is likely, from all that appears, to be productive of any great effect. So long ago as 1831, Prince C. L. Bonaparte, in his "Essai de une distribution medicale des Animaux," published at Rome, and in 1837 communicated to the Linnean Society of London, "A new Systematic Arrangement of Vertebrated Animals," which was subsequently printed in that Society's Transactions, and adopted by the learned author. It was founded on the principle that the several species of the Zoological families of the Zoological binomial system are united by the same name; and usually to the same extent as they may be at the first aspect, they have been found to be practically useless, though such of their characters as their upholders have advanced with truth deserve attention. Physiology may one day very likely assist the systematist; but it must be real physiology and not a sham.

In 1835 Paul Gervais, who had already contributed to the Zoology of M. de Castelnau's "Expedition dans les parties centrales de l'Amérique du Nord," published a more important work on ornithology, the zoochnict and certain other birds of doubtful or anomalous position, published some remarks on the characters which could be drawn from the sternum of birds (Ann. Sci. Nat. Zoologie, ser. 4, vol. 5, pp. 519-661, or the "Histoire naturelle de l'Amérique du Nord," published in 1831, and it is a certain merit of that work, that the author has made the first attempt to recognize publicly that characters drawn from the posterior part of the sternum, and particularly from the "pelican", can by physiological "notations," are of comparatively little importance, since their number is apt to vary in forms that are closely allied, and even in species that are usually associated in the same genus or unquestionably belong to the same family, while these "notches" sometimes become simple foramina, in certain cases should place the other hand foramina may exceptionally change to "notches," and not infrequently disappear wholly. Among his chief systematic determinations we may mention that he refers thelinamous to the family of the herons, and considers the pelican as a member of the "pelecanids," which it only resembles in its feet having all the toes connected with a web. Finally divers, auks and penguins, according to him, form the last term in the series. The concept of forming a separate order. It is a curious fact that even at a date so late as this, and by an investigator so well informed, doubt should still have existed whether Apteryx (see Kewi) should be referred to the "eider," or the "swan," as he also seems to think. The remarks of this esteemed author do not go much beyond such as might occur to any one who had made a study of a good series of specimens; but many of them are published for the first time, and the author earnestly insists on the necessity of not resting solely on sternal characters, but associating with them those drawn from other parts of the body.

Three years later in the same journal (xi. 11-145, pls. 2-4) he published some remarks more descriptive than physiological on some birds "ostéologiques des oiseaux appliquées à la classification naturelle de ces animaux," strongly urging the superiority of such characters over those drawn from the bill or feet, which, he remarks, though they may have sometimes given correct notions, have never, especially when led by the "foramen sternale" and food to have sometimes afforded happy results, they have often been deceptive; so that, should more be wanted than to draw up a mere inventory of creation or trace the distinctive outline of each species, he recommends, at least he recommends, to avoid these characters. At the same time he states that authors who have occupied themselves with the sternum alone have often produced uncertain results, especially when they have neglected its anterior for its posterior part; for in truth the characters of the sternum are not essentially connected with the "pelican". But he adds that, still, one is not likely to be deceived if one is careful in his observations. Yet this distinguished zoologist selects the sternum as furnishing the key to his primary groups or "Orders" of the class, adopting, as Merrem has done before, the same two divisions Carinate and Extinct, and subdivides the latter Homalosterni. Some unknown fate has hitherto hindered

1 Archiv für Naturgeschichte, vii. 2, pp. 93. 94. The division seems to have been instituted by this author a couple of years earlier in the second edition of his Handbuch der Naturgeschichte (a work not seen by the present writer), but not then to have received a scientific name. It included all Picariae which had not "zygodactyl feet," that is to say, toes placed in pairs, two before and two behind.

2 Thus he cites the cases of Mochetes paganus and Scolopax rusticola among the "limicoles," and Lorus cataractes among the "laridés," as differing from their nearest allies by the possession of only one "notch" on either side of the keel. Several additional instances are cited in Philos. Transactions (1869), p. 337. note.

3 These terms were explained in his great work L'organisation du règne animal, oiseaux, begun in 1855, to mean exactly the same as those applied by Merrem to his two primary divisions.
ORNITHOLOGY

his from making known to the world the rest of his researches in regard to the other bones of the skeleton till he reached the head, and in the memoir cited he treats of the sternum of only a portion of his first "Order." This is the more to be regretted by all ornithologists, for he contented himself to consider what to do with the sternum, but that it might have been a very great boon—the showing in what way external characters coincided with those presented by osteology. It was also within the scope of his plan to have continued on a more extended scale, and to have presented to ornithologists, as Hermann in his Supplement, the results of M. Blanchard's investigations, if completed, would obviously have taken extraordinary high rank among the highest contributions to ornithology. As it is, so much of them as we have are of considerable importance; for, in this unfortunately unhappy memoir, he has described and determined the chief differences which the sternums of a great many different groups of his "Tropidosterni" presents, and to some extent makes a methodical disposition of them accordingly.

Thus he separates the birds of prey into three groups: (1) the Aquilinae, Falconidae and Vivulidae of the systematicist of his time, but distinguishing the whole Vultures of the fossil from those of his; (2) Gypogeronus, the secretary-bird (q.v.); and (3) the owls (q.v.). Next he places the races (q.v.), and then the vast assemblage of genera of which he declares to be all of one type, even genera like Pirro (manakin, q.v.) and Pifio—and concludes with the somewhat heterogeneous conglomeration of forms, beginning with Cypaeus (q.v.) and ending with the systematists' established order, 

Des Murs. d'elogie ornithologique au point de vue de la classification, which contains (pp. 529-538) a "Systema Oologicum" as the final result of his labours. In this scheme birds are arranged according to the author considered to be their natural method and sequence; but the result exhibits some unities as illogical as can well be met with in the whole range of tentative arrangements of the class, together with some very unjustifiable divorces. Its basic principle of classification of Cuvier, the modifications of which by Des Murs will serve to demonstrate the feebleness of that system, the opinion is generally deemed worth having. Few, if any, of the faults of that classification are removed, and the improvements suggested, if not established by his successors, especially of other countries than France, are, as far as known to the author, as arbitrary as the modifications of Cuvier, L'Herminier, are only cited to be set aside. Ornithologists have no reason to be thankful to Des Murs, notwithstanding his zeal in behalf of his study. It is perfectly true that in several or even in many instances, his conclusions are not reached, and the result, according to the evidence on which they are based, need not have been reached, but this does not excuse him for making assertions (and such assertions are not infrequent) based on evidence that is either wholly trustworthy or needs further inquiry before it can be accepted as the truth. For it is not only the power of the pen, but also the ability to stand up and be counted, which is needed to establish the truth.

This is the case of "the evolution" of which the author speaks, and may also be said of the evolutionists, who, unless they are well informed, may have found it more convenient to follow the lead of the author in the use of the terms and ideas of natural history, instead of being led by the ideas and the application of terms which are better known to them. Indeed, the power of the pen has probably been the only influence at work in this respect, and the only way of procuring a better knowledge of the subject is by the disuse of the terms and ideas which are not known to the author, and by the introduction of terms and ideas which are known to him.

Results of Doctrine of Evolution.

Until about this time systematists, almost without exception, may be said to have been wandering with no definite purpose. At least their purpose was indefinite compared with that which they now have before them. No doubt they all agreed in saying that they were prosecuting a search for what they could call the true system of natural classification, but they were not nearly at the end of their agreement, for in what true system consisted the opinions of scarcely any two would coincide, unless to own that it was some shadowy idea beyond the present power of mortals to reach or even comprehend.

The Quinians, who boldly asserted that they had fathomed the mystery of creation, had been shown to be no wiser than other men, if indeed they had not utterly befooled themselves; for their theory at best could give no other explanation of things than that they were because they were. The conception of such a process as has now come to be called by the name of evolution was certainly not novel; but except to two men the way in which that process was or could be possible had not been revealed. Here there is no need to enter into details of the history of evolution; but there was possibly no branch of zoology in which so many of the best informed and consequently the most advanced of its workers sooner accepted the principles of evolution than ornithology, and of course the effects were not restricted to any other line of investigation.

Ornithologists now felt they had something before them that was really worth investigating. Questions of affinity, and the details of geographical distribution, were endowed with a real interest, in comparison with which any interest that had hitherto been taken was a trifling pastime. Classification assumed a wholly different aspect. It had up to this time been more than the shuffling of cards, the ingenious arrangement of counters in a pretty pattern. Henceforward it was to be the serious study of the workings of nature in producing the beings we see around us from beings more or less like them, that had existed in bygone ages and had been the parents of a varied and varying offspring—our fellow-creatures of to-day. Classification for the first time was something more than the expression of a fancy, not that it had not also its imaginative side. Men's minds began to figure to themselves the original type of some well-marked genus or family of birds. They could even imagine themselves as having been one of them, and to which whole groups that now differed strangely in habits and appearance— their discernment aided, may be, by some isolated form which yet retained undeniable traces of a primitive structure. More dimly still visions of what the first bird may have been like could be reasonably entertained; and, passing even to a higher antiquity, the reptilian parent whence all birds have sprung was brought within reach of man's consciousness. But, relieved as it may be by reflections of this kind—dreams some may perhaps still call them—the study of ornithology has unquestionably become harder and more serious; and a corresponding change in the style of investigation, followed in the works that remain to be considered, will be immediately perceptible.

That this was the case is undeniably shown by some remarks of Canon Tristram, who, in treating of the Alaudidae and Saxicolinae of Algeria (whence he had recently brought a large collection of specimens of his own making), says, "I do not think that we could "not help feeling convinced of the truth of the views set forth by Messrs Darwin and Wallace," adding that it was "hardly possible, I should think, to illustrate this theory better than by the larks and chats of North Africa." It is unnecessary to continue the

1 M. Blanchard's animadversions on the employment of external characters, and on trusting to observations on the habits of birds, called forth a rejoinder from A. R. Wallace (Ibis, 1864, pp. 36-41), who successfully showed that they are not altogether to be despised.

2 The more general term of "ornithologist" is sometimes used to include the naturalist who studies the habits of birds, as well as the zoologist who studies their structure.

3 Neither Lamarck nor Robert Chambers (the now acknowledged author of Vestiges of Creation), though both systematists, rationally indicated any means, to use the old phrase, the "transmutation of species" could be effected.
ORNITHOLOGY

[TAXOMONY]

quotation; the few words just cited are enough to assure to their author the credit of being (so far as is known) the first ornithological specialist who had the courage publicly to recognize and receive the new and at that time unpopular idea of the natural classification of birds. But greater work was at hand. In June 1866 W. K. Parker brought to the meeting of the Zoological Society a memoir "On the Ornithology of Balneicetes," subsequently published in that Society's Transactions (iv. 266-351). Of this contribution to science, as of all the rest which have since proceeded from him, may be said in the words he himself has applied (ut supra, p. 271) to the work of another labourer in a not distant field: "This is a model paper for unbiased observation, and freedom from that pleasant mode of supposing instead of ascertaining what is the true nature of an anatomical element." Indeed, the study of this memoir, limited though it be in scope, could not fail to convince any one that it proceeded from the mind of one who taught with the authority derived directly from original knowledge, and not from association with the scribes—a conviction that has become strengthened as, in a series of successive memoirs, the stores of more than twenty years' silent observation and unremitting research were unfolded, and, more than that, the hidden forces of the science of morphology were gradually brought to bear upon almost each subject that came under discussion. These different memoirs, being technically monographs, have strictly no right to be mentioned in this place; but there is scarcely one of them, if one indeed there be, that does not deal with the generalities of the study; and the influence they have had upon contemporary investigation is so strong that it is impossible to refrain from noticing them here, though want of space forbids us from enlarging on their contents.

For some time past rumours of a discovery of the highest interest had been agitating the minds of zoologists, for in 1861 Wagner, Andreas Wagner had sent to the Academy of Sciences of Munich (Sitzungsberichte, pp. 146-154; Ann. Nat. History, series 3, ix. 261-267) an account of what he conceived to be a feathered reptile (assigning to it the name Grifosaurus), the remains of which had been found in the lithographic beds of Solenhofen; but he himself, through failing health, had been unable to see the fossil. In 1862 the slabs containing the remains were acquired by the British Museum, and towards the end of that year Sir R. Owen communicated a detailed description of them to the Philosophical Transactions (1863, pp. 33-47), proving their bird-like nature, and referring them to the genus Archaeopteryx of Herrmann von Meyer, hitherto known only by the impression of a single feather from the same geological beds. Wagner foresaw the use that would be made of this discovery by the adherents of the new philosophy, and, in the usual language of its opponents at the time, strove to ward off the "misinterpretations" that they would put upon it. His protest, it is needless to say, was unavailing, and all who respect his memory must regret that the outset of life failed to give him that insight into the future which is poetically ascribed to it. To Darwin and those who believed with him scarcely a day might have been more welcome; but Sir R. Owen's researches of its orithic affinity saw that it must belong to a type of birds wholly unknown before, and one that in any future for the arrangement of the class must have a special rank reserved for it.1

It behoves us next to mention the "Outlines of a Systematic Review of the Class of Birds," communicated by W. Lillieborg to the Zoological Society in 1866, and published in its Proceedings for that year (pp. 5-20), since it was immediately reprinted by the Smithsonian Institution, and with that authorization has exercised a great influence on the opinions of American ornithologists. It is probable that the higher groups could hardly need notice here. This paper is indeed little more than an English translation of one published by the author in the annual volume (Arsskrift) of the Scientific Society of Upsala for 1864, and addressed to the pre-Darwinian epoch should perhaps have been more properly treated before, but that at the time of its original appearance it failed to attract attention. The chief merit of the scheme perhaps is that, contrary to nearly every precedent, it attempts to subdivide the lowest and richest to the higher groups, which is of course the natural mode of proceeding, and one therefore to be commended. Otherwise the "principles" on which it is founded are not clear to the ordinary zoologist. One of them is said to be incomparability; and, though this is explained to mean, not "muscular strength alone, but vivacity and activity generally,"2 it does not seem to form a character that can be easily appreciated either as to quantity or quality; in fact, most persons would deem it quite immeasurable, and, as such, removed from practical consideration.

Moreover, Professor Lillieborg's scheme, being actually an adaptation of that of Sundevall, of which we shall have to speak at some length almost immediately, may possibly be left for the present with these remarks.

In the spring of the year 1867 Professor T. H. Huxley, to the delight of an appreciative audience, delivered at the Royal College of Surgeons of England a course of lectures on birds, and a few weeks after presented an abstract of his researches to the Zoological Society, in whose Proceedings for the year, it will be found printed (pp. 415-472) as a paper upon "The Classification of Birds, and on the taxonomic value of the modifications of certain of the cranial bones observable in that Class." Starting from the basis "that the phrase 'birds are generally modified reptiles' would hardly be an exaggerated expression of the closeness" of the resemblance between the two classes, which he had previously bridged under the name of Sauropsida (as he had bridged the Piscæ and Amphibia as Ichthyopsida), he drew in bold outline both their likenesses and their differences, and then proceeded to inquire how the Aves could be most appropriately subdivided into orders, sub-orders and families. In this course of lectures he had already dwelt at some length on the insufficiency of the characters on which such groups as had hitherto been thought to be established were founded; but for the consideration of this part of his subject there was no room in the present paper, and the reasons why he arrived at the conclusion that the existing classifications of philosophically homologous features of the class must be sough are here left to be inferred. The upshot, however, admits of no uncertainty: the class Aves is held to be composed of three "orders"—

I. SAURURAe, Hæckel; II. RATTIAE, Merrem; and III. CARINATAE, Merrem.

The Saururae have the metacarpals well developed and not ankylosed, and the caudal vertebrae are numerous and large, so that the caudal region of the spine is longer than the body. The skull is complete and strong, the feet very passercine in appearance. The skull and sternum were at the time unknown, and indeed the whole order, without doubt entirely extinct, rested exclusively on the celebrated fossil, but for the consideration of this part of his subject there was no room in the present paper, and the reasons why he arrived at the conclusion that the existing classifications of philosophically homologous features of the class must be sought are here left to be inferred. The upshot, however, admits of no uncertainty: the class Aves is held to be composed of three "orders"—

1 It is fair to state that some of Professor Parker's conclusions regarding Balneicetes were contested by the late Professor J. T. Reinhardt (Oevers. K. D. Vid. Selsk. Forhandlinger, 1861, pp. 135-154; Ibid. 1862, pp. 158-175), and as it seems to the present writer not ineffectually. Professor Parker replied to his critic (Ibis, 1862, pp. 297-299).

2 This was done shortly afterwards by Professor Haeckel, who proposed the name Saururæ for the group containing it.

3 On this ground it is stated that the Passeres should be placed highest in the class.

4 This peculiarity had led some zoologists to consider the struthious birds more nearly allied to the Mammalia than any others.
The Carinae are divided, according to the formation of the palate, into four "Suborders," and named (i.) Dromaeognathae, (ii.) Schizognathae, (iii.) Desmognathae, and (iv.) Aegithognathae. The Dromaeognathae resemble the Rattiae, and especially the genus Dromaeus, whose palatal structures and are composed of the Tinamous (q.v.). The Schizognathae include a great many of the forms belonging to the Linnæan Orders Gallinae, Grallae, and Anseres. In them the vomer, however variable, always tapers to a point anteriorly, while behind it includes the basipatalia branched between the palatals; but neither these nor the pterygoids are borne by its posterior divergent ends. The maxillo-palatals are usually elongated and lamellar, uniting with the palatals, and, bending backward along their inner edge, leave a clear shelf at the name given to the "Suborder") between the vomer and themselves. In the Desmognathae, the vomer is either abortive or so small as to disappear from the skeleton. When it exists, it is always slender, and projects from the inner end of the maxillo-palatals, as a kind of shelf, which is not to be mistaken for the "Suborder" which is between the vomer and themselves. The posterior ends of the palatals and anterior of the pterygoids articulate directly with the vomer. The Schizognathae, the fourth and last of the "Suborders," is characterized by a form of palate in some respects intermediate between the two preceding. The vomer is broad, abruptly truncated in front, and deeply cleft behind, so as to embrace the rostrum of the sphenoid; the palatals have produced postero-external angles; the maxillo-palatals are slender at their origin, and extend obliquely inwards and forwards over the palatals, ending beneath the vomer in expanded extremities, not united either with one another or with the vomer, nor does the latter unite with the nasal septum, though that is frequently ossified.

The above abstract shows the general drift of this very remarkable contribution to ornithology, and it has to be added that for by far the greater number of his minor groups Huxley relied solely on the form of the palatal structure, the importance of which Dr Cuvier had before urged, though to so little purpose. That the palatal structure must be taken into consideration by taxonomers as affording hints of some utility there can no longer be a doubt; but perhaps the characters drawn thence owed more of their worth to the extraordinary perspicuity with which they were presented by Huxley than to their own intrinsic value, and if the same power had been employed to elucidate in the same way other parts of the skeleton—say the bones of the sternal apparatus or even of the pelvic girdle—either set might have been made to appear quite as instructive and perhaps more so. Adventitious value would therefore seem to have been acquired by the bones of the palate through the fact that so great a master of the art of exposition selected them as field of investigation to which to exercise his skill.

At the same time it must be stated this selection was not premeditated by Huxley, but forced upon him as his investigations proceeded. In reply to some critical remarks (Ibis, 1868, pp. 85-96), chiefly aimed at showing the inexpediency of relying solely on one set of characters, especially when those afforded by the palatal bones were not, even within the limits of families, wholly diagnostic, the author (Ibis, 1868, pp. 357-362) announced a slight modification of his original scheme, by introducing three more groups into it, and concluded by indicating how its bearings upon the great question of "genetic classification" might be represented so far as the different groups of Carinae are concerned:

1 These names are compounded respectively of Dromaeus, the generic name of one of the one series of genera, Dromaeus, a bond or tying, sphylos, a finch, and, in each case, eydos, a jaw.

2 The notion of the superiority of the palatal bones to all others for purposes of classification has pleased many persons, from the fact that "no other bones preserve their shapes and are suitable for the reconstruction of the skull, and therefore for the classification of birds sent home by collectors in foreign countries, and are therefore available for study, while such bones as the sternum and pubis are rarely preserved. The common practice of ordinary collectors to at least vestige of the zygodactylous feet which, when one and only one has been properly described as being to "shoot a bird, take off its skin, and throw away its characters."

3 Perhaps this may be partially explained by the fact that the Muscles of the Surgeon, in which these investigations were chiefly carried on, like most other museums of the time, contained a much larger series of the heads of birds than of their entire skeletons, or of any other part of the skeleton. Consequently the materials available for the comparison of different forms consisted in great part of heads only.

4 It is true that from the time of Buffon, though he scorned any regular classification, geographical distribution had been occasionally held to have something to do with systematic arrangement; but the way in which the two were related was never clearly put forth, though people who could read between the lines might have guessed the secret from Darwin's Journal of Researches, as well as from his introduction to the Zoology of the "Beegee" Voyage.
beating on our knowledge of ornithology will be most conveniently treated here.

In November 1870 O. C. Marsh, by finding the imperfect fossilized tibia of a bird in the middle cretaceous shale of Kansas, began a series of wonderful discoveries of great importance to ornithology. Subsequent visits to the same part of North America, often performed under circumstances of discomfort and occasionally of danger, brought to this intrepid and energetic explorer the reward he had so fully earned. Brief notices of his spoils appeared from time to time in various volumes of the American Journal of Science and Arts (Silliman's), but it is unnecessary here to refer to more than a few of them. In that Journal for May 1872 (ser. 3, iii. p. 356) the remains of a large swimming bird (nearly 6 ft. in length, as afterwards appeared) having some affinity, it was thought, to the Cylindroptilidae were described under the name of Hesperornis regalis, and a few months later (iv. p. 344) a second fossil bird from the same locality was indicated as Ichthyornis Regalis. In a later examination of the enormous collections gathered by the author, and preserved in the Museum of Yale University at New Haven, Connecticut, he showed him that this last bird, and another to which he gave the name of Apatornis, possessed well-developed teeth implanted in sockets in both jaws, and induced him to establish (v. pp. 161, 162) for their reception a "sub-class Odontornithes and an order Ichthyornithes. Two years more and the originally found Hesperornis was discovered also to have teeth, but these were inserted in a groove. It was accordingly regarded as the type of a distinct order Odontolcae (x. pp. 403-408), to which were assigned as other characters vertebrae of a saddle-shape and not biconcave, a keelless sternum, and wings consisting only of the humerus. In 1880 Marsh brought out Odontornithes, a monograph of the extinct toothed birds of North America. Herein remains attributed to Hesperornis a score of species, which were referred to eight different genera, are fully described and sufficiently illustrated, and, instead of the ordinal name Ichthyornithes previously used, that of Odontolotomae was proposed. In the author's concluding summary he remarks on the fact that, while the Odontolae, as exhibited in Hesperornis, had teeth inserted in a continuous groove—a low and generalized character as shown by reptiles, they had, however, the strongly differentiated saddle-shaped vertebrae such as all modern birds possess. On the other hand the Odontolotomae, as exemplified in Ichthyornis, having the primitive biconcave vertebrae, yet possessed the highly specialized feature of teeth in distinct sockets. Hesperornis too, with its keelless sternum, had aborted wings but strong legs and feet adapted for swimming, while Ichthyornis had a keeled sternum and powerful wings, but diminutive legs and feet. These and other characters separate the two forms so widely as quite to justify the establishment of as many orders for their reception. Marsh states that he had fully satisfied himself that Archaeopteryx belonged to the Odontornithes, which he thought it advisable for the present to regard as a subclass, separated into three orders—Odontolae, Odontolotomae and Saurisaurae—all well marked, but evidently not of equal rank, the last being clearly much more widely distinguished from the first two than they are from one another. But that these three oldest-known forms of birds should differ so greatly from each other unmistakably points to a great antiquity for the class.

The former efforts at classification made by Sundeavall have already several times been mentioned, and a return to their consideration was promised. In 1872 and 1873 he brought out at Stockholm a Methodia naturalis avium dispositionem tentamen, two portions of which (those relating to the diurnal birds-of-prey and the Corvidae, or forms related to the thrushes) he found himself under the necessity of revising and modifying in the course of 1874, in as many communications to the Swedish Academy of Sciences (K. V.-Ak. Förhandlingar, 1874, No. 2, pp. 21-30; No. 3, pp. 27-30). This Tentamen, containing his complete method ofclassifying birds in general, naturally received much attention, the more so perhaps, since, with its appendices, it was nearly the last labour of its respected author, whose industrious life came to an end in the course of the following year. From what has before been said of his works it may be gathered that, while professedly basing his systematic arrangement of the groups of birds on their external features, he had hitherto striven to make his schemes harmonize if possible with the dictates of internal structure as evinced by the science of anatomy, though he uniformly and persistently protested against the inside being better than the outside. In thus acting he proved himself a true follower of his great countryman Linnaeus; but, without disparagement of his efforts in this respect, it must be said that when internal and external characters appeared to be in conflict he gave, perhaps with unconscious bias, a preference to the latter, for he belonged to a school of zoologists whose natural instinct was to believe that such a conflict always existed. Hence his efforts, praiseworthy as they were from several points of view, and particularly so in regard to some details, failed to satisfy the philosophic taxonomer when generalizations and deeper principles were concerned, and in his practice in respect of certain technicalities of classification he was, in the eyes of the orthodox, a transgressor. Thus instead of contenting himself with terms that had met with pretty general approval, such as class, subclass, order, sub-order, family, subfamily, and so on, he introduced into his final scheme other designations, "agmen," "cohors," "phalanx," and the like, which to the ordinary student of ornithology convey an indefinite meaning, if any meaning at all. He also carried to a very extreme limit his views of nomenclature, which were certainly not in accordance with those held by most zoologists, though this is a matter so trifling as to need no details in illustration. His Tentamen was translated into English by F. Nicholson in 1889, and had a considerable influence on later writers, especially in the arrangement of the smaller groups. In the main it was an artificial system. Birds were divided into "Orders," and among the "Orders," as Dasyptera, according as the young were hatched naked or clothed. The Gymnobaedae are divided into two "orders"—Oscines and Valtures—the former intended to be identical with the group of the same name established by other authors, and, in accordance with the observations of Keyserling and Blasius already mentioned, divided into two "series"—Laminipalntes, having the hinder part of the "tarsus" covered with two horny plates, and Scutellipalntes, in which the same part is scutellated. These Laminipalntes are composed of six cohorts as follows:

Cohors 1. Cichlomorphae.
Cohors 2. Controstrae.
Cohors 3. Coliornithomorphae.
Cohors 4. Certhiomorphae.
Cohors 5. Scutelliplantares.
Cohors 7. Pycnaspideae.
Cohors 8. Taxtaspideae.
Cohors 10. Rapaces and Saprophiagi—the latter include the vultures. Next stands the order Gallinae with 4 "cohors".
In the article "Ornithology" in the ninth edition of this encyclopedia, A. Newton accepted the three subclasses of Huxley, Saururae, Ratitae and Carinidae, and made a series of cautious but critical observations on the minor divisions of the Carinates. In 1888 A. Reichenow in *Die Vögel der zoologischen Gärten* published a classification of birds with a phylogenetic tree. In this he departed considerably from the lines that had been made familiar by English workers, and made great use of natural characteristics. The next attempt of importance appeared in the American *Standard Natural History*, published in Boston in 1885. The volume on birds was written by Dr L. Stejneger and was founded on Elliot Coues's *Key to North American Birds*. Apart from its intrinsic merits as a learned and valuable addition to classification, this work is interesting in the history of ornithology because of the wholesale changes of nomenclature it introduced as the result of much diligence and zeal in the application of the strict rule of priority to the names of birds.

In 1888 there was published the huge monograph by Max Fürbringer entitled *Untersuchungen zur Morphologie und Systematik der Vögel*. In addition to an enormous body of new information chiefly on the shoulder girdle, the alar muscles and the nerve plexuses of birds, this work contained a critical and descriptive summary of practically the whole pre-existing literature on the structure of birds, and it is hardly necessary for the student of ornithology to refer to earlier literature at first hand. Fürbringer supposes that birds must have begun with toothed forms of small or moderate size, with long tails and four lizard-like feet and bodies clothed with a primitive kind of down. To these succeeded forms where the down had developed into body feathers for warmth, not flight, whilst the fore-limbs had become organs of prehension, the hind-limbs of progression. In such bipedal creatures the legs and pelvis became transformed to a condition similar to that of Dinosaurian reptiles. Many of them were climbing animals, and from these true birds with the power of flight were developed. In the course of this evolution there were many cases of arrest or degradation, and one of the most novel of the ideas of Führbringer, and one now accepted by not a few anatomists, was that the ratites or ostrich-like birds were not a natural group but a set of stages of arrested development or of partial degradation. It is impossible to reproduce here Fürbringer's elaborate details and phylogenetic trees with their various horizontal sections, but the following table gives the main outlines:

Whilst Fürbringer was engaged on his gigantic task, Dr Hans Gadow was preparing the ornithological volume of Bronn's *Thier-Reich*. The two authors were in constant communication, and the classifications they adopted had much in common. It is unnecessary here to discuss the views of Gadow, as that author himself has contributed the article *Bird* to this edition of the *Encyclopædia Britannica*, and has there set forth his revised scheme.

(A. N.; P. C. M.)

**ORODES** (also called **Hyrodes**, Pers. *Hurauda*), the name of two Parthian kings.

1. ORODES I., son of Phraates III., whom he murdered in 57 B.C., assisted by his brother Mithradates III. This Mithradates was made king of Media, but soon afterwards was expelled by Orodes and fled into Syria. Thence he invaded the Parthian kingdom, but having reigned for a short time (55) was besieged by Surenas, general of Orodes, in Seleucia, and after a prolonged resistance was captured and slain. Meanwhile Crassus had begun his attempt to conquer the east, but he was defeated and killed in 53 at Carrhae by Surenas, while Orodes himself invaded Armenia and forced King Artavasdes, the son of Tigranes, to abandon the Romans. By the victory of Carrhae the countries east of the Euphrates were secured to the Parthians. In the next year they invaded Syria, but with little success, for Surenas, whose achievements had made him too dangerous, was killed by Orodes (Plut. *Crass.* 33), and Pacorus, the young son of the king, was defeated by C. Cassius in 51. During the civil war the Parthians sided first with Pompey and then with Brutus and Cassius, but took no action until 40 B.C., when Pacorus, assisted by the Roman deserter Labienus, conquered a great part of Syria and Asia Minor, but was defeated and killed by Ventidius in 38 (see *Pacorus*). The old king, Orodes, who was deeply afflicted by the death of his gallant son, appointed
his son Phraates IV, successor, but was soon afterwards killed by him (37 B.C.; Dio. Cass. 40. 23; Justin 42. 4; Plut. Crassus, 33). Plutarch relates that Crassus understood Greek very well; after the death of Crassus the Bacchae of Euripides were represented at his court (Plut. Crass. 33).

2. Orodes II, raised to the throne by the magnates after the death of Phraates V. about a.d. 5, was killed after a short reign “on account of his extreme cruelty” (Joseph. Ant. xviii. 2, 4). (Ed. M.)

**OROGRAPHY** (Gr. ὄρος, mountain, γραφεῖν, to write), that part of physical geography which deals with the geological formation, the surface features and description of mountains. The terms “orography,” “orology” and “oreology” are also sometimes used.

**ORONTE,** the ancient name of the chief Syrian river, also called Draco, Typhon and Axius, the last a native form, from whose revival, or continuous employment in native speech, has proceeded the modern name Ἀξίου (“rebel”), which is variously interpreted by Arabs as referring to the stream’s impetuosity, to its unproductive channel, or to the fact that it flows away from Mount Atlas. The Orontes rises in the great springs of Labwah on the east side of the Buka’s, or inter-Libanon district, very near the fountains of the southward-flowing Litani, and it runs due north, parallel with the coast, falling 2000 ft. through a rocky gorge. Leaving this it expands into the Lake of Homs, having been dammed back in antiquity. The valley now widens out into the rich district of Hamah (Hamah-Ephiphania), below which lie the broad meadow-lands of Ghâb, containing the sites of ancient Apamea and Jarissa. This central Orontes valley ends at the rocky barrier of Jisr al-Hadid, where the river is diverted to the west, and the plain of Antioch opens. Two large tributaries from the N., the Afrîn and Kara Su, here reach it through the former Lake of Antioch, which is now drained through an artificial channel (Nahr al-Kowst). Passing N. of the modern Antakia (Antioch) the Orontes plunges S.W. into a gorge (compared by the ancients to Tempe), and falls 150 ft. in 10 mi. at the mouth of the Suezis (anc. Seleucia Pieria), after a total course of 170 m. Mainly un navigable and of little use for irrigation, the Orontes derives its historical importance solely from the convenience of its valley for traffic from N. to S. Roads from N. and E., converging at Antioch, follow the course of the stream up to Homs, where they fork to Damascus and to Cœle-Syria and the S.; and along its valley have passed the armies and traffic bound to and from Egypt in all ages. (See Antioch and Homs.)

**OROPUS,** a Greek seaport, on the Euripus, in the district Ἱππαῖα, opposite Eretria. It was a border city between Boeotia and Attica, and its possession was a continual cause of dispute between the two countries; but at last it came into the final possession of Athens, and is always alluded to under the Roman empire as an Attic town. The actual harbour, which was called Delphinium, was at the mouth of the Euripus, about a mile north of the city. A village still called Oropo occupies the site of the ancient town. The famous oracle of Amphiaras was situated in the territory of Oropus, 12 stadia from the city. The site has been excavated by the Greek Archaeological Society; it contained a temple, a sacred spring, into which coins were thrown by worshippers, altars and porticoes, and a small theatre, of which the proscenium is well preserved. Worshippers used to consult the oracle of Amphiaras by sleeping on the skin of a slaughtered ram within the sacred building.

**OROSIUS, PAULUS** (fl. 415), historian and theologian, was born in Spain (possibly at Braga in Galicia) towards the close of the 4th century. Having entered the Christian priesthood, he naturally took an interest in the Priscillianist controversy then going on in his native country, and it may have been in connexion with this that he went to consult Augustine at Hippo in 413 or 414. After staying for some time in Africa as the disciple of Augustine, he was sent by him in 415 to Palestine with a letter of introduction to Jerome, then at Bethlehem. The ostensible purpose of his mission (apart, of course, from those of pilgrimage and perhaps relic-hunting) was that he might gain further instruction from Jerome on the points raised by the Priscillianists and Origenists; but in reality, it would seem, his business was to stir up and assist Jerome and others against Pelagius, who, since the synod of Carthage in 411, had been living in Palestine, and finding some acceptance there. The result of his arrival was that John, bishop of Jerusalem, was induced to summon him at his capital in June 415 a synod at which Orosius communicated the decisions of Carthage and read such of Augustine’s writings against Pelagius as had at that time appeared. Success, however, was scarcely to be hoped for amongst Orientals who did not understand Latin, and whose sense of reverence was unshocked by the question of Pelagius, _et quis est mihi Augustinus?_ All that Orosius succeeded in obtaining was John’s consent to send letters and deputations to Innocent of Rome; and, after having waited long enough to learn the unfavourable decision of the synod of Diospolis or Lydda in December of the same year, he returning to north Africa, where he is believed to have died. According to Gennadius he carried with him recently discovered relics of the protomartyr Stephen from Palestine to Minorca, where they were efficacious in converting the Jews.

The earliest work of Orosius, _Consultatio sive commenitorium ad Augustinum de errore Priscillianistarum et Origenitarum_, explains his title to Augustine, 4th B.C.; and is usually printed in the works of Augustine along with the reply of the latter, _Contra Priscillianistas et Origenistas librum_ Orosium. His next treatise, _Liber apologeticus de arbitrio libertate_, was written during his stay in Palestine, and, in connexion with the controversy of his time, is a keen but not always fair criticism of the Pelagian position from that of Augustine. The _Historiae adversus Paganos_ was undertaken at the suggestion of Augustine, to whom it is dedicated. When Augustine proposed this task, he had already planned and made some progress with his own _De civitate Dei_; it is the same argument that is elaborated by his disciple, namely, the evidence from history that the circumstances of the world had not really become worse since the introduction of Christianity, and that, from the historical chronicle of the calamities that have happened to mankind from the fall down to the Gothic period, has little accuracy or learning, and even less of literary charm to commend it; but it was the first attempt in the West of the polemic against paganism in the name of humanity. Its purpose gave it value in the eyes of the orthodox, and the _Hormesta, Ormesta, or Orimista_ as it was called, no one knows why (from Orfosi) [M[undl] Historia] or from de minera mundi? (Vit. Met.) 150, and speedily attained a wide popularity. Nearly two hundred MSS. of it have survived. A free abridged translation by King Alfred is still extant (Old English text, with original in Latin, edited by H. Sweet, 1835). The _editio princeps_ appeared in Aug. 1472, at the press of Haverkamp (Leiden, 1738 and 1767) has now been superseded by C. Zangemeister, who has edited the _Hist._ and also the _Lib. apol._ in vol. v. of the _Corpus sax. eccles. Lat._ (Vienna, 1882), as well as an edit. min. (Leipzig, Teubner, 1890). The sources used are those of Orosius have been investigated by T. de Mörner (De Orosio vita ejusque hist. libr. vii. adversus Paganos, 1844); besides the Old and New Testaments, he appears to have consulted Caesar, Livy, Justin, Tacitus, Suetonius, Plutarch; he also gives great value to Jerome’s translation of the _Chronicles_ of Eusebius.

**ORPHAN,** the term used of one who has lost both parents by death, sometimes of one who has lost father or mother only. In law, an orphan is such a person who is under age. The Late Lat. _orphans_, from which the word, chiefly owing to its use in the Vulgate, was adopted into English, is a transliteration of ὀρφάνος, in the same sense, the original meaning being “ bereft of,” “ destitute,” classical Lat. _orbus_. The Old English word for an orphan was _stæfæld_, stepchild. By the custom of the city of London, the lord mayor and aldermen, in the Court of Orphans, have the guardianship of the children still under age of deceased freemen. Orphans’ courts exist for the guardianship of orphans and administration of their estates in Delaware, Maryland, New Jersey and Pennsylvania in the United States. In other states these are performed by officers of the Probate Court, known as “surrogates,” or by other titles.

**ORPHEUS,** in Greek legend, the chief representative of the art of song and playing on the lyre, and of great importance in the religious history of Greece. The derivation of the name is uncertain, the most probable being that which connects it with
ORPHEUS

ορφής ("dark," ὀρφαῖος, ὀρφης). In accordance with this, Orpheus may have originated as a god of darkness, or the liberator of the powers of darkness by his gift of song; or he may have become so-called because his rites were celebrated by night (cf. Dionysus, Nyctelius). It is possible, but very improbable, that Orpheus was an historical personage; even in ancient times his existence was denied. According to Maass, he was a chthonian deity, the counterpart of Dionysus, with whom he is closely connected; J. E. Harrison, however, regards him as a religious reformer from Crete, who introduced the doctrine of ecstatics without intoxication amongst the Thracians and was slain by the votaries of the frenzied ritual. S. Reinach sees in him the fox roaming "in the darkness," to the Thracians a personification of the wine-god, torn in pieces by the Bassaroi (fox-madmen). Although by some he was held to be a Greek, the tradition of his Thracian origin was most generally accepted. His name does not occur in Homer or Hesiod, but he was known in the time of Ibycus (c. 550 B.C.), and Findar (322-442 B.C.) speaks of him as "the father of songs." From the 6th century onwards he was looked up to as one of the chief poets and musicians of antiquity, the inventor or perfector of the lyre, who by his music and singing was able not only to charm the wild beasts, but even to draw the trees and rocks from their places, and to arrest the rivers in their course. As one of the pioneers of civilization, he was supposed to have taught mankind the arts of medicine, writing and agriculture. As closely connected with religious life, he was an augur and seer, practised magical arts, especially astrology; founded or rendered accessible many important cults, such as those of Apollo and Dionysus; instituted mystic rites, both public and private; prescribed initiatory and purificatory ritual. He is said to have visited Egypt, and to have become acquainted there with the writings of Moses and with the doctrine of a future life.

According to the best-known tradition, Orpheus was the son of Oeagrus, king of Thrace, and the muse Calliope. During his residence in Thrace he joined the cult of Dionysus, whose leader Jason had been invested by Chiron that only by the aid of Orpheus would they be able to pass by the Sirens unscathed. His numerous services during the journey are described in the Argonautica that goes under his name. But the most famous story in which he figures is that of his wife Eurydice. While fleeing from Aristaeus, she was bitten by a serpent and died. Orpheus went down to the lower world and by his music softened the heart of Pluto and Persephone, who allowed Eurydice to return with him to earth. But the condition was attached that he should walk in front of her and not look back until he had reached the upper world. In his anxiety he broke his promise, and Eurydice vanished again from his sight. The story in this form belongs to the time of Virgil, who first introduces the name of Aristaeus. Other ancient writers, however, speak of his visit to the underworld; according to Plato, the infernal gods only "presented an apparition" of Eurydice to him.

After the death of Aristaeus, Orpheus rejected the advances of the Thracian women, who, jealous of his faithfulness to the memory of his lost wife, tore him to pieces during the frenzy of the Bacchic orgies. His head and lyre floated "down the swift Hebrus to the Lesbian shore," where the inhabitants buried his head and a shrine was built in his honour near Antissa. The lyre was carried to heaven by the Muses, and was placed amongst the stars. The Muses also gathered up the fragments of his body and buried them at Leibethra below Olympus, where the nightingales sang over his grave, while yet another legend places his tomb at Diom, near Fydna in Macedonia. Other accounts of his death are: that he killed himself from grief at the failure of his journey to Hades; that he was struck with lightning by Zeus for having revealed the mysteries of the gods to men; or he was torn to pieces by the Maenads for having abandoned the cult of Dionysus for that of Apollo.

According to the Gruppe, the legend of the death of Orpheus is a late imitation of the Adonis-Osiris myth. Osiris, like Orpheus, is torn in pieces, and his head floats down every year from Egypt to Byblus; the body of Atis, the Phrygian counterpart of Adonis, like that of Orpheus, does not suffer decay. The story is repeated of Dionysus; he is torn in pieces, and his head is carried down to Lesbos. Without going so far as to assert that Orpheus is a hypothesis of Dionysus, there is no doubt that a close connexion existed between them from very early times. According to Frazer, these supposed "distorted reminiscences" of the practice of human sacrifice, especially of divine kings, the object of which was to ensure fertility in the animal and vegetable worlds. Orpheus, in the manner of his death, was considered to personate the god Dionysus, and was thus the representative of the god torn to pieces every year, a ceremony enacted by the Bacchae in the earliest times with a human victim, afterwards with a bull to represent the bull-formed god. A distinct feature of this ritual was ἄρμοφαγία, the flesh of the victim raw, whereby the participants imagined that they consumed and assimilated the god represented by the victim, and thus became filled with the divine ecstasy. A. W. B. Simpson (Journ. Hell. Stud., xiv. p. 254) sees in the myth an anachronistic restatement of the old myth of the Dionysiac sacrifice of a Phrygian king in the 6th century B.C. (cf. Paus. ii. 8. 1) to the latest modern writers. Both inculcated a peculiar kind of ascetic life, both had a mystical speculative theory of religion, with purificatory rites, abstinence from beans, &c., but Orpheus was more especially religious, while Pythagoreanism, at least originally, inclined more to be a political and philosophical creed.

The rules of the Orphic life prescribed abstinence from beans, flesh, certain kinds of fish, &c., the wearing of a special kinds of clothes, and numerous other practices and abominences. The ritual of worship was peculiar, not admitting bloody sacrifices. The belief was taught in the homogeneity of all living things, in the doctrine of original sin, in the transmigration of souls, in the doctrine that the soul is entombed in the body (ρηματοσωματικόν), and that it may gradually attain perfection during connexion with a series of bodies. When completely purified, it will be freed from this "circle of generation" (κύκλος γενετόμος), and will again become divine, as it was before its entrance into a mortal body.

The chief ceremonies of the nightly ritual were sacrifice and libation; prayer and purification; the representation of sacred deities, as the god of love, who was identified with most of the numerous gods of the Orphic pantheon; the rape of Persephone; and the descent into Hades. These were introduced as a "sacred explanation" (ἰερός λόγος) of the rules and prescriptions. To these also belong the rite of ἄρμοφαγία, and the communication of liturgical formulæ for the guidance of the soul of the dead man on his way to the underworld, which also served as credentials to the gods below. Some of the so-called "formulae," or magical inscriptions engraved on small plates of gold, chiefly dating from the 4th and 3rd centuries B.C., have been discovered in inscriptions in southern Italy, Crete and Rome.

It does not appear, however, that a regularly organized or numerous Orphic sect ever existed, nor that Orphism ever became popular; it was too abstract, too full of symbolism. On the other hand, the genuine Orphics, a fraternity of religious ascetics, found unscrupulous imitators and impostors, who preyed upon the credulous and ignorant. Such were the Orphoeotelestae or Metagyrtae, wandering priests who went round the country with an awn carrying the sacred properties (Aristophanes, Fraggs. 159) and a bundle of sacred books. They promised an easy expiation for crimes to both living and
dead on payment of a fee, undertook to punish the enemies of their clients, and held out to them the prospect of perpetual banqueting and drinking-bouts in Paradise.

A large number of writings in the tone of the Orphic religion were ascribed to Orpheus. They were in such subjects as the origin of the gods, the creation of the world, the ritual of purification and initiation, and oracular responses. These poems were recited at rhapsoic contests together with those of Homer and Hesiod, and Orphic hymns were used in the mysteries of Egypt. The most familiar to moderns is that of Oномакритос (g.p.), who, in the course of the Peisistratidae, made a collection (including forgeries of his own) of Orphic songs and legends. In later times, Orphic theology engaged the interest of part of Greek mythology, and in particular the so-called "rhapsoic theogony" in particular exercised great influence on Neoplatonism. The Orphic literature (of which only fragments remain) was united in a corpus, called Ἐρωταί, the chief poem in which was a good part, and also included a collection of Orphic hymns, liturgic songs, practical treatises, and poems on various subjects. The so-called Orphic Poems, still extant, are of much later date, probably belonging to the 4th century A.D.; they consist of 1) a work by Orphos, the "Ars, a didactic poem on the magic powers of stones, called Lithika, (a) eighty-seven hymns on various divinities and personified forces of nature. Some of these hymns are probably earlier (1st and 2nd centuries). They form part of the important controversy between Christian and pagan writers in the 3rd and 4th centuries after Christ; pagan writers quoted them to show the real meaning of the multitude of gods, while Christians retorted by reference to the obscene and disgraceful fictions by which the former degraded their gods.

BIBLIOGRAPHY.—C. A. Lobeck's Ἀργαλοφασία (1829) is still indispensable. Of more modern writings on Orpheus and Orphism the most widely used have been edited by O. Gruppe in Roscher's Lexicon der Mythologie and by P. Monceux in Darmen and Baglio's Dictionnaire des anciens; "Orphica" in Smith's Dictionary of Greek and Roman Antiquities (3rd ed., 1891); L. C. Purtscher's "Orpheus," vol. i. (Leipzig, 1891, vol. 2nd ed., 1908, with a critical appendix by Gilbert Murray on the Orphic tablets); E. Rohde, Psyche, ii. (1907), and article in Heidelberger Jahrbiicher (1896); E. W. Maass, Orpheus (1895); S. Reinach, "Orphisme," in Dictionnaire des antiquités grecques et romaines, (1899); O. Gruppe, Griechische Mythologie, ii. (1906), pp. 1028-1041; T. Gompertz, Greek Thinkers, i. (Eng. trans., 1901), pp. 84-90, 123-147; E. Gerhard, Uber Orpheus und die Orphiker (1861); A. Dieterich, Neleia (1893), pp. 72-108, 136-162, 225-231; A. Knauth, Die Theogonie der Orphischen Schule, (1908); A. Dieterich, De hymnici Orphici, (1891); G. F. Schömann, Griechische Alterthümer, ii. (Ed. H. Lipsius, 1902), p. 379; F. Stengel, Die griechischen Kultusväter, (1898), p. 63.

There is an edition of the Orphic Fragments and of the poems by E. Abel (1885). The Argaflontia has been edited separately by J. R. Loeber and E. Lornitz (1903). The Lysistrata by T. Tyrwhitt (1791). In the French language there is an English translation of the Hymns by T. Taylor (reprinted, 1896).

On the representations of Orpheus in heathen and Christian art (in which he is finally transformed into the archetypal god) with his sheep see A. Baumeister, Denkmaler des classischen Altertums, ii. p. 125; K. Krüger, Vor- und Alterthumschaften (Tübingen, 1855); F. X. Kraus, Realencyclopaedie des christlichen Alterthums, ii. (1880); J. A. Martigny, Die jüdischen mystischen Charaktere (1889); A. Heiss and A. Neisser, Die antiken Orphischen Vor- und Erlebnisse (Leipzig, 1893); and the articles in Roscher's and Darmen and Baglio's Lexicons.

The observance of Orpheus, as was to be expected of a legend told both by Ovid and Boeotius, retained its popularity throughout the middle ages and was transformed into the likeness of a northern fairy tale. In English medieval literature it appears in three somewhat different versions: Sir Orfeo, a "lay of Britanny" printed from the Drury MS. by J. R. Ritson's Ancient English Metrical Romances, vol. ii. (1802); Orfeo and Neumand from the Auchinleck MS. in David Laing's Select Remains of the Ancient Popular Poetry of Scotland (new ed., 1885); and Kyng Orfeo from the Ashmole MS. 996, as Orpheus in the Metrical Delineation of Orpheus the Mythographer (Oxford, 1804). The poems show traces of French influence.

(TH. F. ; X.)

ORPHRY, gold or other richly ornamented embroidery, particularly an embroidered border on an ecclesiastical vestment, (see VESTMENTS). The word is from O. Fr. orf레, mod. orf레, from med. Lat. aurifriscium, aurifrigium, &c., for aurifrigium, 1

1 For Orphism in relation to the Eleusinian and other mysteries see MYSTERY.

curnum, gold, and phrygium, a name given to gold-embroidered tissues, also known as estes phrygiae, the Phrygians being famous for their skill in embroidering in gold.

ORPIMENT (auripigmentum), arsenic trisulphide, As₂S₃, or yellow realgar (g.p.), occurring in small quantities as a mineral crystallizing in the rhombic system and of a brilliant yellow-orange colour in Bohemia, Peru, &c. For industrial purposes an artificial orpiment is manufactured by subliming one part of sulphur with two of arsenic trioxide. The sublimate varies in colour from yellow to red, according to the intimacy of the combination of the ingredients; and by varying the relative quantities used many intermediate tones may be obtained. These artificial preparations are highly poisonous. Formerly, under the name of "king's yellow," a preparation of orpiment was in considerable use as a pigment, but now it has largely superseded by chrome-yellow. It was also at one time used in dyeing and calico-printing, and for the unhairing of skins, &c.; but safer and equally efficient substitutes have been found.

ORPINGTON, a town in the Dartford parliamentary division of Kent, England, 13 m. S.E. of London, and 25 m. S. by E. of Chislehurst, on the South-Eastern & Chatham railway. Pop. (1901), 4259. The church (Early English) contains some carved woodwork and ancient brasses. An old mansion called the Priory dates in part from 1393. The oak-panelled hall and the principal rooms are of the 15th century. In 1873 John Ruskin set up at Orpington a private publishing house for his works, in the hands of his friend George Allen. Fruit and hops are extensively grown in the neighbourhood. From its pleasant situation in a hilly, wooded district near the headwaters of the Cray stream, Orpington has become in modern times a favourite residential locality for those whose business lies in London. A line of populous villages extends down the valley between Orpington and Bexley—St Mary Cray (pop. 1894), St Paul's Cray (1897), Foots Cray (an urban district, 5871), and North Cray.

ORREY; CHARLES BOYLE, 4TH EARL OF (1676-1731); the second son of Roger, 2nd earl, was born at Chelsea in 1676. He was educated at Christ Church, Oxford, and soon distinguished himself by his learning and abilities. Like the first earl, he was an author, soldier and statesman. He translated Plutarch's Life of Lysander, and published an edition of the epistles of Phalaris, which engaged him in the famous controversy with Bentley. He was three times member for the town of Huntington; and on the death of his brother, Lionel, 3rd earl, in 1703, he succeeded to the title. He entered the army, and in 1709 was raised to the rank of major-general, and sworn one of her Majesty's privy council. At the battle of the Wood he acted with distinguished bravery. He was appointed queen's envoy to the states of Brabant and Flanders; and having discharged that trust with credit, he created an English peer, as Baron Boyle of Marston, in Somersetshire. He received several additional honours in the reign of George I; but having had the misfortune to fall under the suspicion of the government he was committed to the Tower, where he remained six months, and was then admitted to bail. On a subsequent inquiry it was found impossible to criminate him, and he was discharged. He died on the 28th of August 1731. Among the works of Roger, earl of Orrey, will be found a comedy, entitled As you find it, written by Charles Boyle. His son John (see CORK, EARLS OF), the 5th earl of Orrey, succeeded to the earldom of Cork on the failure of the elder branch of the Boyle family, as earl of Cork and Orrey.

ORREY, ROGER BOYLE, 1ST EARL OF (1621-1679), British soldier, statesman and dramatist, 3rd surviving son of Richard Boyle, 1st earl of Cork, was born on the 25th of April 1621, created baron of Broghill on the 28th of February 1657, and educated at Trinity College, Dublin, and, according to Wood,

1 The orrey, an astronomical instrument—consisting of an apparatus which illustrates the motions of the solar system by means of the revolution of balls moved by wheelwork—invented, or at least constructed, by Graham, was named after the earl.
also at Oxford. He travelled in France and Italy, and coming home took part in the expedition against the Scots. He returned to Ireland on the outbreak of the rebellion in 1641 and fought at the battle of Liscarril in September 1642. On the resignation of the marquis of Ormonde, Lord Broghill consented to serve under the parliamentary commissioners till the execution of the king, when he retired altogether from public affairs and took up his residence at Marston in Somerseter. Subsequently he originated a scheme to bring about the Restoration, but when on his way abroad to concert measures with Charles he was unexpectedly visited by Cromwell in London, who, after informing him that his plans were well known to the council, and warning him of the consequence of persisting in them, offered him a command in Ireland against the rebels, which, as it entailed no obligations except faithful service, was accepted. His assistance in Ireland proved invaluable. Appointed master of the ordnance, he soon assembled a body of infantry and horse, and drove the rebels into Kilkenny, where they surrendered.

On the 10th of May 1650 he completely defeated at Maccam a force of Irish advancing to the relief of Clonmel, and joining Cromwell assisted in taking the latter place. On the anticipated departure of Cromwell from Ireland, and with Ireland, whom he joined, in the siege of Limerick, and defeated the force marching to its relief under Lord Muskerry, thus effecting the capture of the town. By this time Broghill had become the fast friend and follower of Cromwell, whose stern measures in Ireland and support of the English and Protestants were welcomed after the policy of concession to the Irish initiated by Charles I.

He was returned to Cromwell's parliaments of 1654 and 1656 as member for the county of Cork, and also in the latter assembly for Edinburgh, for which he elected to sit. He served this year as lord president of the council in Scotland, where he won much popularity; and when he returned to England he was included in the inner cabinet of Cromwell's council, and was nominated in 1657 a member of the new house of Lords. He was one of those most in favour of Cromwell's assumption of the royal title, and proposed a union between the Protector's daughter Frances and Charles II. On Cromwell's death he gave his support to Richard; but as he saw no possibility of maintaining a government he left for Ireland, where by resuming his command in Munster he secured the island for Charles and anticipated Monk's overtures by inviting him to land at Cork. He sat for Arundel in the Convention and in the parliament of 1661, and at the Restoration was taken into great favour. On the 4th of September 1666 he was created earl of Orrery. The same year he was appointed a lord justice of Ireland and drew up the Act of Settlement. He continued to exercise his office as lord president of Munster till 1668, when he resigned it on account of disputes with the duke of Ormonde, the lord-lieutenant. On the 23rd of November he was impeached by the House of Commons for "raising of money by his own authority upon his majesty's subjects," but the provocation of parliament by the king interrupted the proceedings, which were afterwards renewed. He died on the 26th of October 1670. He married Lady Margaret Howard, 3rd daughter of Theophilus, 2nd earl of Suffolk, whose charms were celebrated by Suckling in his poem "The Bride." By her he had besides five daughters, two sons, and five grandsons, the eldest, Roger (1646-1681 or 1682), succeeded as 2nd earl of Orrery.

In addition to Lord Orrery's achievements as a statesman and administrator, he gained some reputation as a writer and a dramatist. He was the author of An Answer to a Scandalous Letter ... A Full Discovery of the Treachery of the Irish Rebels (1662), printed with the letter to which it was addressed. In 1663 his brother, an officer in the army, wrote a pamphlet entitled Irish Colours Displayed ... being also ascribed to him; Parthenissa, a novel (1654); English Adventures by a Person of Honour (1656), whence Otway drew his tragedy of the Orphan; Travels and Adventures of a Young Man (1657), a work of considerable merit; poems, of little interest, including verses On His Majesty's Happy Restoration (unprinted), On the Death of Abraham Cowley (1677), The Dream (unprinted), on most of the Festivals of the Church (1681); plays in verse, of some literary but no dramatic merit, of which Henry V. (1664), Mustapha (1668), Tryphon (acted 1668), The Black Prince (1669), Herod the Great (published 1694), and Alemira (1702) were tragedies, and Guzman (1669) and Mr Anthony

comedy. A collected edition was published in 1737, to which was added the comedy As you find it. The General is also attributed to him.

AUTHORITIES.—State Letters of Roger Boyle, 1st Earl of Orrery, ed. with his life by Th. Morrice (1742); Add. MSS. (Brit. Mus.) 25,287 (letter-book when governor of Munster), and 32,065 sqs. 109-188 (letters); article in the Dict. of Nat. Biog. and authorities there collected; Wood's Athenae Oxonienses, iii. 1200; Biographia Britannica (Kippen); Ormondo, ed. by Lady Cork; Orrery's Treatise (1693) (Preface): Contemporaries Hist. of Affairs in Ireland, ed. by John T. Gilbert (1879-1880); Cal. of State Pap., Irish and Domestic.

ORRIS-ROOT (apparently a corruption of "iris root"), the rhizomes or underground stems of three species of Iris, I. germanica, I. florentina and I. pallida, closely allied plants growing in subtropical and temperate latitudes, but principally identified with North Italy. The three plants are indiscriminately cultivated in the neighbourhood of Florence as an agricultural product under the name of "ghiaugnulio." The rhizomes are in August dug up and freed of the rootlets and brown outer bark; they are then dried and packed in casks for sale. In drying they acquire a delicate but distinct odour of violets. As it comes into the market, orris-root is in the form of contorted sticks and irregular knots, and is sold in length, of a compact chalyca, and is of a white or greyish-cream colour. It is principally powdered for use in dentifrices and other scented dry preparations.

ORSEOLO, the name of a Venetian family, three members of which filled the office of doge.

PIETRO ORSEOLO I. (c. 928-937) acted as ambassador to the emperor Otto I. before he was elected doge in August 976. Just previous to this event part of Venice had been burned down and Pietro began the rebuilding of St Mark's church and the ducal palace. He is chiefly celebrated, however, for his piety and his generosity, and after holding office for two years he left Venice secretly and retired to a monastery in Aquitaine, where he passed his remaining days. He was canonized in 1731.

PIETRO ORSEOLO II. (d. 1609), a son of the previous doge, was himself elected to this office in 991. He was a great builder, but his chief work was to crush the pirates of the Adriatic Sea and to bring a long stretch of the Dalmatian coast under the rule of Venice, thus relieving the commerce of the republic from a great and pressing danger. The fleet which achieved this result was led by the doge in person; it sailed on Ascension Day, the 9th of May 1000, and its progress was attended with uninterrupted success. In honour of this victory the Venetians instituted the ceremony which afterwards grew into the spasso di salto del mar, or marriage of the sea, and which was celebrated each year on Ascension Day, while the doge added to its title that of duke of Dalmatia. In many other ways Pietro's services to the state were considerable, and he may be said to be one of the chief founders of the commercial greatness of Venice. The doge was on very friendly terms with the emperor Otto III. and also with the emperors at Constantinople, and in 1003 he sailed against the Saracens and compelled them to raise the siege of Bari. In 1003 his son Giovanni was associated with him in the dogeship, and on Giovanni's death in 1007 another son, Ottone, succeeded to this position.

OTTONE ORSEOLO (d. 1032), whose godfather was the emperor Otto III., became sole doge on his father's death in 1000. He murdered his sister, queen of Hungary, but the growing wealth and influence of the Orseolo family soon filled the Venetians with alarm. About 1024 Ottone and Orso were driven from Venice, but when Orso's rival, Poppo, patriarch of Aquileia, seized Grado, the exiled doge and his brother was recalled and Grado was recovered. In 1026 Ottone was banished; he found a refuge in Constantinople, where he remained until his death, although in 1030 an embassy invited him to return to Venice, where his brother Orso acted as agent for fourteen months. Orso remained patriot of Grado until his death in 1045, and another member of the Orseolo family, Domenico, was doge for a single day in 1031. After the fall of the Orseoli the Venetians decreed that no doge should name his successor, or associate any one with in the
dogeship. Ottone's son, Pietro, was king of Hungary for some time after the death of his uncle, St Stephen, in 1038. So the Kolohe family later dem Herrn Peter II. Orsolo (Cottin, 1688); H. F. Brown, Venice (1895); F. C. Hodgson, The Early History of Venice (1901); and W. C. Hazlitt, The Venetian Republic (1900).

**ORSHA** (Polish Orsa), a town of Russia, in the government of Mogilev, 74 m. by rail W.S.W. of Smolensk on the Moscow-Warsaw railway, and on the Dnieper. Pop. (1897), 13,641. It is an important entrepôt for grain, seeds and timber. It is a very old town, mentioned in the annals under the name of Rasa in 1067. In the 13th century it was taken by the Lithuanians, who fortified it. In 1604 the Poles founded there a Jesuit college. The Russians besieged Orsha more than once in the 16th and 17th centuries, and finally annexed it in 1657.

**ORSINI,** the name of a Roman princely family of great antiquity, and whose temporal and spiritual feuds with the Colonna are one of the dominant features of the history of medieval Rome. According to tradition the popes Paul I. (757) and Eugenius II. (824) were of the Orsini family, but the probable founder of the house was a certain Ursus (the Bear), about whom very little is known, and the first authentic Orsini pope was Giacinto Orsini, son of Petrus Bobo, who assumed the name of Celestine III. (1191). The latter endowed his nephews with church lands and founded the fortunes of the family, which alone of the Guelf families was able to confront the Ghibelline Colonna. "Orsini for the Church" was their war-cry in opposition to "Colonna for the people." In the 13th century the "Sons of the Bear" were already powerful and rich, and under Innocent III. they waged incessant war against other families, including that of the pope himself (Conti). In 1241 Matteo Orsini was elected senator of Rome, and sided with Pope Gregory IX. against the Colonna and the Emperor Frederick II., saving Rome for the Guelfic cause. In 1266 the family acquired Marino, and in 1277 Giovanni Orsini was elected pope as Nicholas III. However, in 1279, despite the fact that he was a crusader, the Colonna in 1297, the Orsini played a conspicuous part in the expedition and captured Naples, which the pope granted them as a fief. On the death of Benedict XI. (1304) fierce civil warfare broke out in Rome and the Campagna for the election of his successor, and Cardinal Napoleon Orsini appears as the leader of the French faction at the conclave. The Campagna was laid waste by the feuds of the Orsini, the Colonna, and the Caetani. At this time the Orsini held the castle of S. Angelo, and a number of palaces on the Monte Giordano, which formed a fortified and walled quarter. In 1332, during the absence of the popes at Avignon, the feuds between Orsini and Colonna, in which even Giovanni Orsini, although cardinal legate, took part, reduced Rome to a state of complete anarchy. We find the Orsini again at war with the Colonna at the time of Rienzi. In 1435 Francesco Orsini was appointed prefect of Rome, and created duke of Gravina by Pope Eugenius IV. In 1483 war between the Orsini and the Colonna broke out once more, the former supporting the pope (Sixt IV.). Virginio Orsini led his faction against the rival house's strongholds, which were stormed, the Orsini family being thereby completely destroyed; the Orsini fortunes waxed and waned, and the family was often considered, but they always remained a powerful family and gave many soldiers, statesmen, and prelates to the church. The title of prince of Solofra was conferred on them in 1620, and that of prince of the Holy Roman Empire in 1629. In 1724 Vincenzo Maria Orsini was elected pope (Benedict XIII.) and gave his family the title of Roman princes.

**ORSINI, FELICE** (1810–1868), Italian revolutionist, was born at Meldone in Romagna. He was destined for an ecclesiastical career, but he soon abandoned that prospect, and became an ardent liberal, joining the Giovane Italia, a society founded by Giuseppe Mazzini. Implicated together with his father in revolutionary plots, he was arrested in 1844 and condemned to imprisonment for life. The new pope, Pius IX., however, set him free, and he led a company of young Magonists in the first war of Italian independence (1848), distinguishing himself in the engagements at Treviso and Vicenza. He was elected member of the Roman Constituent Assembly in 1849, and after the fall of the republic he conspired against the papal autocracy once more in the interest of the Mazzinian party. Mazzini sent him on a secret mission to Hungary, but he was arrested in 1854 and imprisoned at Mantua, escaping a few months later. In 1857 he published an account of his prison experiences in English under the title of Austrian Dangers in Italy, which led to a rupture between him and Mazzini. He then entered into negotiations with Ausonio Franchi, editor of the Ragione di Turin, which he proposed to make the organ of the pure republicans. But having become convinced that Napoleon III. was the chief obstacle to Italian independence and the principal cause of the anti-liberal reaction throughout Europe, he went to Paris in 1857 to conspire against him. On the evening of the 14th of January 1858, while the emperor and empress were on their way to the theatre, Orsini and his accomplices threw three bombs at the imperial carriage. The intended victims were unhurt, but several other persons were killed and wounded. Orsini himself was wounded, and was only arrested; on the 11th of October he wrote a famous letter to Napoleon, in which he exhorted him to take up the cause of Italian freedom. He addressed another letter to the youth of Italy, stigmatizing political assassination. He was condemned to death and executed on the 15th of March 1858, meeting his fate with great calmness and bravery. Of his accomplices Pieri also was executed, Rudio was condemned to death but obtained a commutation of sentence, and Gomez was condemned to hard labour for life. The importance of Orsini's attempt lies in the fact that it terrified Napoleon, who came to believe that unless he took up the Italian cause other attempts would follow and that sooner or later he would be assassinated. This fear contributed not a little to the emperor's subsequent Italian policy.

(Milan, 1861); Enrico Montazio, I contemporanei Italiani-Felice Orsini (Turin, 1862); La verità sulle Orsini, par un ancien proscrit (1879); Angelo Arbott, Tufo e la fuga di Felice Orsini (Cagliari, 1893).**

**ORTA, LAKE OF,** in N. Italy, W. of Lago Maggiore. It has been so named since the 16th century, but was previously called the Lago di San Giulio because of the region—Cusio is a poetic name. Its southern end is about 22 m. by rail N.W. of Novara on the main Turin-Milan line, while its north end is about 4 m. by rail S. of the Gravellona-Toce railway station, half-way between Ornavasso and Omegna. It has an area of about 61 sq. m., it is about 8 m. in length, its greatest depth is 46 ft., and the surface is 935 ft. above sea-level, while its width varies from 1/2 to 14 m. Its scenery is characterized by Italian, while the large island of San Giulio (just W. of the village of Orta) has some very picturesque buildings, and takes its name from the local saint, who lived in the 4th century. The chief place is Orta, built on a peninsula projecting from the east shore of the lake, while Omegna is at its northern extremity. It is supposed that the lake is the remnant of a much larger sheet of water by which originally the waters of the Toce or Tosa flowed south towards Novara. As the glaciers retreated the waters flowing from them sank, and were gradually diverted into Lago Maggiore. This explanation why no considerable stream feeds the Lake of Orta, while at its north end the N. Tosa, Colpo, and other streams flow out of it, but in about 3 m. it falls into the Strona, which in turn joins the Toce or Tosa, a short distance before this river flows into Lago Maggiore. (W. A. B. C.)

**ORTELIUS ORTELS, WORTELS, ABRAHAM,** next to Mercator the greatest geographer of his age, was born at Antwerp on the 14th of April 1527, and died in the same city on the 4th of July 1598. He was of German origin, his family coming from Augsburg. He travelled extensively in western Europe, especially in the Netherlands; and west Germany (e.g. 1550, 1575, 1578); France (1550-1560, &c.); England and Ireland
ORTHEZ—ORTHOCLOSE

(1577), and Italy (1578, and perhaps twice or thrice between 1580 and 1588). Beginning as a map-engraver (in 1547 he enters the Antwerp guild of St Luke as adsoetor van tekenen), his early career is that of a business man, and most of his journeys before 1560 are for commercial purposes (such as his yearly visits to the Frankfort fair). In 1560, however, when travelling with Gerhard Kremer (Mercator) to Trier, Lorraine and Poitiers, he seems to have been attracted, largely by Mercator's influence, towards the career of a scientific geographer; in particular he now devoted himself, at his friend's suggestion, to the compilation of that atlas or Theatre of the World by which he became famous. In 1564 he completed a mappemonde, which afterwards appeared in the Theatrum. He also published a map of Egypt in 1565 a plan of Britenburgh Castle on the coast of Holland, and perhaps a map of Asia, before the appearance of his great work. In 1570 (May 20) was issued, by Gilles Coppens de Diest at Antwerp, Ortelius' Theatrum Orbis Terrarum, the "first modern atlas" (of 53 maps). Three Latin editions of this (besides a Flemish, a French and a German) appeared before the end of 1572; twenty-five editions came out before Ortelius' death in 1598, and several others were published subsequently, for the vogue continued till about 1612. Most of the maps were admittedly reproduced (a statement of Ortelius and, in the text, of the editors, Ortelii et Plantin). Of the discrepancies of delineation or nomenclature occur. Errors, of course, abound, both in general conceptions and in detail; thus South America is very faulty in outline, and in Scotland the Grampians lie between the Firth and the Clyde; but, taken as a whole, this atlas with its accompanying text was a monument of rare erudition and industry. Its immediate precursor and prototype was a collection of thirty-eight maps of European lands, and of Asia, Africa, Tartary and Egypt, gathered together by the wealthy and enterprise, and through the agents of Ortelius' friend and patron, Gilles Hoofman, lord of Cleydael and Aertselaer: most of these were printed in Rome, eight or nine only in Belgium. In 1573 Ortelius published seventeen supplementary maps under the title of Additamentum Theatris Orbis Terrarum. By this time he had formed a fine collection of coins, medals and antiquities, and this produced (also in 1573, published by Philippe Galle of Antwerp) his Deorum dea rumque capta ... ex Museo Ortelii (reprinted in Gronovius, Thes. Gr. Ant. vol. vii.). In 1575 he was appointed geographer to the king of Spain. Philip II, on the recommendation of a Monsieur de Morppy, who wished for his orthodoxy (his family, as early as 1535, had fallen under suspicion of Protestantism). In 1578 he laid the basis of a critical treatment of ancient geography by his Synonymia geographica (issued by the Plantin press at Antwerp and republished as Thessarum geometricus in 1596). In 1584 he brought out his Nomenclator Ploteaematis, his Porpergon (a series of maps illustrating ancient history, sacred and secular), and his Itinerarium per nonnullas Galliae Belgicae partes (published at the Plantin press, and reprinted in Hegenitius, Itin. Frisio-Holl.), a record of a journey in Belgium and the Rhineland made in 1575. Among his last works were an edition of Caesar (C. I. Caesaris omnia quae extant, Leiden, Raphaelingen, 1593), and the Aurei saeclii image, sive Germanorum veterum vita (Philippe Galle, Antwerp, 1596). He also aided Welser in his edition of the Peutingen Table in 1598. In 1598 he received a presentation from Antwerp city, similar to that afterwards bestowed on Rubens; his death and burial (in St Michael's Abbey church) in 1598 were marked by public mourning.

ORTHÉZ, a town of south-western France, capital of an arrondissement in the department of Basses-Pyrénées, 25 m. N.W. of Pau on the Southern railway to Bayonne. Pop. (1906) town 4159; commune 6254. It is finely situated on the right bank of the Gave de Pau which is crossed at this point by a bridge of the 14th century, having four arches and surmounted at its centre by a tower. Several old houses, and a church of the 12th, 13th and 15th centuries, are of interest, but the most remarkable building is the Tour de Moncade, a pentagonal tower of the 13th century, once the keep of a castle of the viscounts of Béarn, and now used as a meteorological observatory. A building of the 16th century is all that remains of the old Calvinist university (see below). The hôtel de ville is a modern building containing the library.

Orthez has a tribunal of first instance and is the seat of a suburb. The spinning and weaving of cotton, especially of the fabric called toile de Béarn, flour-milling, the manufacture of paper and of leather, and the preparation of hams known as jambons de Bayonne and of other delicacies are among its industries. There are quarries of stone and marble in the neighbourhood, and the town has a thriving trade in leather, hams and limes.

At the end of the 12th century Orthez passed from the possession of the viscounts of Dax to that of the viscounts of Béarn, whose chief place of residence it became in the 13th century. Froissart records the splendour of the court of Orthez under Gaston Phoebus in the latter half of the 14th century. Jeanne d'Albret, reigned of the Calvinist university in the town and Theodore Beza taught there for some time. An envoy sent in 1569 by Charles IX. to revive the Catholic faith had to stand a siege in Orthez which was eventually taken by assault by the Protestant captain, Gabriel, count of Montgomery. In 1684 Nicholas Foucault, intendant under Louis XIV., was more successful, as the inhabitants, ostensibly at least, renounced Protestantism, which is nevertheless still strong in the town. In 1814 the duke of Wellington defeated Marshal Soult on the hills to the north of Orthez.

ORTHOCLOSE, an important rock-forming mineral belonging to the felspar group (see FELSITP). It is a potash-felspar, KAlSi$_3$O$_8$, and crystallizes in the monoclinic system. Large and distinctly developed crystals are frequently found in the crussy cavities of granites and pegmatites. Crystals differ somewhat in habit; for example, they may be prismatic with an orthorhombic aspect (fig. 1), as in the variety adularia (from the Adular Mountains in the St Gotthard region); or tabular (fig. 2), being flattened parallel to the clino-pinacoid or plane of symmetry $b$ (010), as in the variety sandline (cavos, cavid, a board); or again the crystals may be elongated in the direction of the edge between $b$ and the basal plane $c$ (001), which is a characteristic habit of orthoclase from the granite quarries at Baveno in Italy. Twinning is frequent, and there are three well-defined twin-laws: (1) Carlsbad twins (fig. 4). Here the two individuals of the twin interpenetrate or are united parallel to the clino-

![Fig. 1][fig1]
![Fig. 2][fig2]
![Fig. 3][fig3]
The angle between these two cleavages is 90°, hence the name orthoclase (from the Gr. ὀρθός, right, and κλαίνω, to break), given by A. Breithaupt in 1833, who was the first to distinguish orthoclase from the other feldspars. There are also imperfect cleavages parallel to the faces of the prism m (110).

The hardness is 6, and the sp. gr. 2-56. Crystals are sometimes colourless and transparent with a glassy aspect, as in the varieties adularia, sanidine and the rhyacolite of Monte Somma, Vesuvius.

The optical characters are somewhat variable, the plane of the optic axes being perpendicular to the plane of symmetry in some crystals and parallel to it in others; further, when some crystals are heated, the optic axes gradually change from one position to the other. In all cases, however, the acute negative bisectrix of the optic axes lies in the plane of symmetry and is inclined to the edge b/c at 3-7°, or, in varieties rich in soda, at 10-12°. The mean refractive index is 1.524, and the double refraction is weak (0.006).

Analyses of orthoclase usually prove the presence of small amounts of soda and lime in addition to potash. These constituents are, however, probably present as plagioclase (albite and oligoclase) intergrown with the orthoclase. The two minerals are interlaminated parallel to the ortho-pinacoid (100) or the pinacoid (001), and they may readily be distinguished in the fresh hand specimen: felspar, known as perthite, from Perth in Lanark county, Ontario. Frequently, however, as in microphtehite and cryptoperthite, this is on a microscopic scale or so minute as to be no longer recognizable. These directions (100) and (001) are planes of parting in orthoclase, and along them alteration frequently takes place, giving rise to schiller effects. Moonstone (q.e.) shows a pearly opalescent reflection on these planes; and brilliant coloured reflections in the same directions are exhibited by the labradorite orthoclase from the augite-syenite of Fredriksvern and Laarvik in southern Norway, which is much used as an ornamental stone. The same effect is shown to a lesser degree by murchisonite, named in honour of Sir R. I. Murchison, from the Trissler conglomerate of Heavitree near Exeter.

Orthoclase is a principal constituent of many acido-igneous rocks (granite, syenite, porphyry, trachyte, phonolite, &c.) and of crystalline schists and gneisses. In porphyries and in some granites (e.g., those of Shap in Westmorland, Cornwall, &c.) it occurs as embedded crystals with well-defined outlines, but usually it presents no crystalline form. In the trachyte of Drachenfels and the Laacher See in Rhenish Prussia there are large porphyritic crystals of glassy sandine. The best crystals are those found in the crystalline cavities and veins of granites, pegmatites and gneisses, for example in Iceland and Elba in Italy. Alabashka near the town of Breithaupt in the Ural, Hirschberg in Silesia, Tanokami-yama in the province of Omi, Japan, and the Mourn Mountains in Ireland. As a mineral of secondary origin orthoclase is sometimes found in cavities in basaltic rocks, and its occurrence in metamorphic mineral veins has been observed. It has been formed artificially in the laboratory and is sometimes met with in furnace products.

The commonest alteration product of orthoclase is kaolin (q.e.): the frequent cloudiness or opacity of crystals is often due to partial alteration to kaolin. Mica and epidote also result by the alteration of orthoclase.

ORTHODOX EASTERN CHURCH (frequently spoken of as the Greek Church, &c., and described officially as "The Holy Orthodox Eastern Church") is the historical representative of the churches of the ancient East. It consists of (a) those churches which have accepted all the decisions of the first seven general councils, and have remained in full communion with one another, (b) such churches as have derived their origin from these by missionary activity, or by absorption without loss of communion. The Eastern Church is both the source and background of the Western. Christianity arose in the East, and Greek was the language of the Scriptures and early services of the church, but when Latin Christianity established itself in Europe and Africa, and when the old Roman empire fell in two, and the eastern half became separate in government, interests and ideas from the western, the term Greek or Eastern Church acquired gradually a fixed meaning. It denoted the church which included the patriarchates of Antioch, Alexandria, Jerusalem and Constantinople, and their dependencies. The ecclesiastical division of the early church, at least within the empire, was based upon the civil. Constantine introduced a new partition of the empire into dioceses, and the church adopted a similar division.

The bishop of the chief city in each diocese naturally rose to a pre-emience, and was commonly called exarch, a title borrowed from the civil jurisdiction. ruins were given to a man of such title patriarch was restricted to the most eminent of these exarchs, and councils decided who were worthy of the dignity. The council of Nicea recognized three patriarchs—the bishops of Rome, Alexandria and Antioch. To these were afterwards added the bishops of Constantinople and Jerusalem. When the empire was divided, there was one patriarch in the West, the bishop of Rome, while in the East there were at first two, then four and latterly five. This geographical fact has had a great deal to do in determining the character of the Eastern Church. It is not a despotic monarchy governed from one centre and by a monarch in whom plenitude of power resides. It is an oligarchy of patriarchs. It is based, of course, on the great body of bishops; but episcopal rule, through the various grades of metropolitan, primate, exarch, attains to sovereignty only in the five patriarchal thrones. Each patriarch is, within his diocese, what the Gallican theory makes the pope in the universal church. He is supreme, and not amenable to any of his brother patriarchs, but is within the jurisdiction of an occasional council. This makes the Eastern Church quite distinct in government and traditions of polity from the Western. It has ever been the policy of Rome to efface national distinctions, but under the shadow of the Eastern Church national churches have grown and flourished. Revolts against Rome have always implied a repudiation of the ruling principles of the papal system; but the schismatic churches of the East have always reproduced the ecclesiastical polity of the church from which they ascended.

The Greek Church, like the Roman, soon passed beyond the imperial dioceses which at first fixed its boundaries, but it was far less successful than the Roman in preserving its conquests for Christianity. This was due in the main to the differing quality of the forces by which the area covered by the two churches was respectively invaded. The northern barbarians by whom the Western empire was overrun had long stood in awe of the power and the civilization of Rome, which they recognized as superior; but the barbarians were so long exposed to and conquered by the heritage of the law and the religion of the conquered empire and, whether they were pagans or Arian heretics, became in the end Catholic Christians. In the East it was otherwise. The empire maintained itself long, and died hard; but its decline and fall meant not only the overthrow of the emperors of the East, but largely that of the civilization and Christianity which they represented. The Arabs, and after them the Turks, attacked the empire as the armed missionaries of what they regarded as a superior religion; Christianity survived in the vast territories they

Holy Images to the churches after the downfall of Iconoclasm (February 19, 842); but it has gradually assumed a wider significance as the celebration of victory over all heresies, and is now one of the most characteristic festivals of the Eastern Church.
ORTHODOX EASTERN CHURCH

conquests only as a despised and tolerated superstition, its ecclesiastical organisation only as a convenient mechanism for governing a subject and tributary population. It is true that the Eastern Church made up in some sort for her losses by missionary conquests elsewhere. Greek Christianity became the religion of the Slavs as Latin Christianity became that of the Germans; but the Orthodox Church never conquered her conquerors, and the historian is too apt to enrol on her past glories and forget her present strength.

Early History.—The early history of the Eastern Church is outlined in the article CHURCH HISTORY. Here it is proposed only to give in somewhat more detail the causes of division which led (1) to the formation of the schismatic churches of the East, and (2) to the open rupture with Latin Christianity.

The great dogmatic work of the Eastern Church was the definition of that portion of the creed of Christendom which concerns theology proper—the doctrines of the essential nature of the Godhead, and the doctrine of the Godhead in relation with manhood in the incarnation, while it fell to the Western Church to define anthropology, or the doctrine of man’s nature and needs. The controversies which were all at once Eastern, the Theanthropoi, for they alone are represented in the schismatic churches of the East. These controversies will be best described by reference to the oecumenical councils of the ancient and undivided church.

All the churches of the East, schismatic as well as orthodox, accept unreservedly the decrees of the first two councils. The schismatic churches protest against the additions made to the creeds of Nicaea and Constantinople by succeeding councils. The Nicaeo-Constantinopolitan creed declared that Christ was consubstantial (homoousios) with the Father, and that He had become man (hominousios). Disputes arose when theologians tried to explain the latter phrase. These differences took two separate and extreme types, the one of which forcibly separated the two natures so as to deny anything like a real union, while the other insisted upon a mixture of the two, or an absorption of the human in the divine. The former was the creed of Chaldaea and the latter the creed of Egypt. Chaldaea was the home of Nestorianism, Egypt the land of Monophysitism. The controversy between the Monophysites and the Monothelites, the schismatics of the first two councils, and reject the decrees of all the rest as unwarranted alterations of the creed of Nicaea. The Monophysites accept the first three councils, but reject the decree of Chalcedon and all that come after it.

The council of Ephesus (a.d. 431), the third oecumenical, had interested upon applying the term Theotokos to the Virgin Mary, and this was repeated in the symbol of Chalcedon, which says that Christ was born of the Virgin Mary, the Theotokos, "according to the manhood." The same symbol also declares that Christ is "to be acknowledged in two natures . . . indivisibly and inseparably." Hence the Nestorians, who insisted upon the duality of the natures to such a degree as to lose sight of the unity of the person, and who rejected the term Theotokos, repudiated the decrees both of Ephesus and of Chalcedon, and upon the promulgation of the decrees of Chalcedon formally separated from the church. Nestorianism had sprung from an exaggeration of the doctrine of the schism weakened that patriarchate and its dependencies. It took root in Chaldaea, and became very powerful. No small part of the literature and science of the Mahomedan Arabs came from Nestorian teachers, and Nestorian Christianity spread far and wide through Asia (see NESTORIANS).

The council of Chalcedon (451), the fourth oecumenical, declared that Christ is to be acknowledged "in two natures—unconfusedly, unchangeably," and therefore decided against the opinions of all who either believed that the divinity is the essence nature of Christ, or who, rejecting this, taught only one composite nature of Christ (one nature and one person, instead of two natures and one person). The advocates of the one nature theory were called Monophysites (q.v.), and they gave rise to numerous sects, and to at least three separate national churches—the Jacobites of Syria, the Copts of Egypt and the Abyssinian Church, which are treated under separate headings. The decision of the Roman Church, without the sanction of the Council, by the middle of the 5th century, was adopted by the Latins, and has ever since been the established Church of Rome; and the Councils of Constantinople, of Nicaea, of Chalcedon, and of Ephesus, were, in the East, the foundations on which the Church of the East was built.

Later History.—The relation of the Byzantine Church to the Roman may be described as one of growing estrangement from the 5th to the 11th century, and a series of abortive attempts at reconciliation since the latter date. The estrangement and final rupture may be traced to the increasing claims of the Roman bishops and to Western influence in the doctrine of the Holy Spirit, accompanied by an alteration of creed which the Eastern Church never accepted.

Three bishops stood forth prominently, principally from the political eminence of the cities in which they ruled—the bishops of Rome, Alexandria and Antioch. The transfer of the seat of empire from Rome to Constantinople gave the bishops of Rome a possible rival in the patriarch of Constantinople, but the absence of an overawing court and of meddling statesmen did more than recoup the loss to the head of the Roman Church. The theological calmness of the West, amid the violent theological disputes which troubled the Eastern patriarchates, and the statesmanlike wisdom of Rome’s greater bishops, combined to give a unique position to the pope, which councils in vain strove to shake, and which in time of difficulty the Eastern patriarchs were fain to acknowledge and make use of, however they might protest against it and the conclusions deduced from it. But this pre-eminence, or rather the Roman idea of what was involved it, was never acknowledged in the East; to press it upon the Eastern patriarchs was to prepare the way for separation. The desire of the West to have and in times of irritation was to cause a schism. The theological genius of the East was that of the West. The Eastern theology had its roots in Greek philosophy, while a great deal of Western theology was based on Roman law. The Greek fathers succeeded the Sophists, the Latin theologians succeeded the Roman advocates (Stanley’s Eastern Church, ch. 1.). This gave rise to misunderstandings, and at last led to two widely separate ways of regarding and defining one important doctrine—the procession of the Holy Spirit from the Father or from the Father and the Son. Political jealousies and interests intensified the disputes, and at last, after many premonitory symptoms, the final break came in 1054, when Pope Leo IX smeared Michael Cerularius and the whole of the Eastern Church with an excommunication. There had been mutual excommunications before, but they had not resulted in permanent schisms. Now, however, the separation was final, and the ostensibly cause of its finality was the introduction by the Latins of two words Filioque into the creed.1 This is the addition which was and which still remains the permanent cause of separation. Filius, which is pointed out in his second volume (ch. 3–5) that there was a restoration, and which still remains the permanent cause of separation. Filius, which is pointed out in his second volume (ch. 3–5) that there was a restoration, and which still remains the permanent cause of separation. Filius, which is pointed out in his second volume (ch. 3–5) that there was a restoration, and which still remains the permanent cause of separation.
The “Filioque” controversy involved a very small one, but it brings out clearly the opposing characteristics of Eastern and Western theology, and so has acquired an importance far beyond its own worth. The question is really one about the relations subsisting between the persons of the Trinity and their hypostatical properties. The Western Church affirms that the Holy Spirit “proceeds from” the Father and from the Son. It believes that the Spirit of the Father must be the Spirit of the Son also. Such a theory seems alone able to satisfy the practical instincts of the West, which did not concern itself with the metaphysical aspect of the Trinity, but with Godhead in its relation to redeemed humanity. The Eastern Church affirms that the Holy Spirit proceeds from the Father only, and takes its stand on John xvi. 26. The Eastern theologian thinks that the Western double procession degrades the Deity and destroys the perfection of the Trinity. The double procession, in his eyes, means two active principles (αύται) in the Deity, and it means also that there is a confusion between the hypostatical properties; a property possessed by both distinctive of the First Person is attributed also to the Second. This is the theological, and there is conjoined with it an historical and moral dispute. The Easterns allege that the addition of the words Filioque was made, not only without authority, and therefore unwarrantably, but also for the purpose of forcing a rupture between East and West in the interests of the barbarian empire of the West.

Attempts at reconciliation were made from time to time afterwards, but were always wrecked on the two points of papal supremacy, when it meant the right to impose Western usages on the East, and of the addition to the creed. First there was the negotiation between Pope Gregory IX. (1227-1241) and Germanus, patriarch of Constantinople. The Roman conditions were practically recognition of papal jurisdiction, the use of unleavened bread and permission to omit Filioque if all books written against the Western doctrine were burnt. The patriarch refused the terms. Then, later in the 13th century, came negotiations under Innocent IV. and Clement IV., in which the popes proposed the same conditions as Gregory IX. to Church in the East. These proposals were rejected by the Easterns, who regarded them as an attempt to enforce new creeds on their church.

The negotiations at the council of Lyons (1274) were, strictly speaking, between the pope and the Byzantine emperor, and were more political than ecclesiastical. Michael Palaeologus ruled in Constantinople while Baldwin II., the last of the Latin emperors, was an exile in Europe. Palaeologus wished the pope to acknowledge his title to be emperor of the East, and in return promised submission to the papal supremacy and the union of the two churches on the pope’s own terms. This enforced union lasted only during the lifetime of the emperor. The only other attempt at union which requires to be mentioned is that made at the council of Florence. It was really suggested by the political weakness of the Byzantine empire and the dread of the approach of the Turks. John Palaeologus the emperor, Joseph the patriarch of Constantinople, and several Eastern bishops came to Italy and appeared at the council of Florence—the papal council, the rival of the council of Basel. As on former occasions the representatives of the East were at first deceived by false representations; they were betrayed into recognition of papal supremacy, and tricked into signing what could afterwards be represented as a submission to Western doctrine. The natural consequences followed—a repudiation of what had been done; and the Eastern bishops on their way home took care to make emphatic their ritualistic differences from Rome. Soon after came the fall of Constantinople, and with this event an end to the political reasons for the submission of the Orthodox clergy. Rome’s schemes for a union which meant an unconditional submission on the part of the Orthodox Church did not cease, however, but they were no longer attempted on a grand scale. Jesuit missionaries after the Reformation stirred up schisms in some parts of the Eastern Church, and in Austria, Poland and elsewhere large numbers of Orthodox Christians submitted, either willingly or under compulsion to the see of Rome (see Roman Catholic Church, section Unitarian Churches).

Doctrines and Creeds.—The Eastern Church has no creeds in the modern Western use of the word, no normative summaries of what must be believed. It has preserved the older idea that a creed is an adorning confession of the church engaged in worship; and, when occasion called for more, the belief of the church was expressed more by way of public testimony than in symbolical books. Still the doctrines of the church can be gathered from these confessions of faith. The Eastern creeds may thus be roughly placed in two classes—the oecumenical creeds of the early undivided church, and later testimonies defining the position of the Orthodox Church of the East with regard to the belief of the Roman Catholic and of Protestant Churches. These testimonies were called forth mainly by the protest of Greek theologians against Jesuitism on the one hand, and against the reforming tendencies of the patriarch Cyril Lucaris on the other. The Orthodox Greek Church adopts certain of the doctrinal and confessional decisions of the modern synods, councils, together with the canons of the Conciliar Quinisextum or second Trullan council (692); and they further hold that all these definitions and canons are simply explanations and enforcements of the Nicaeo-Constantinopolitan creed and the decrees of the first council of Nicaea. The first four councils settled the orthodox faith on the doctrines of the Trinity and of the Incarnation; the fifth supplemented the decisions of the first four. The sixth declared against Monothelitism; the seventh sanctioned the worship (δοξα, not ἀδιάβροχη λατρεία) of images; the council held in the Trullus (a saloon in the palace at Constantinople) supplemented by canons of discipline the doctrinal decrees of the fifth and sixth councils.

The Reformation of the 16th century was not without effect on the Eastern Church. Some of the Reformers, notably Melanchthon, expected to effect a reunion of Christendom by means of the Easterns, cherishing the same hopes as the modern Old Catholic divines and their English sympathizers. Melanchthon himself sent a mission to the august council of Florence (1512), and Joasaph, patriarch of Constantinople, and subsequently Jacob Andreæ and Martin Crusius began a correspondence with Ieremlaia, patriarch of Constantinople, in whose church they asked an official expression of his opinions about Lutheran doctrine. The result was that Ieremlaia answered in his Censura Orientalis Ecclesiae condemning the distinctive principles of Lutheranism.

The reformatory movement of Cyrillos Lucaris (q.v.), patriarch of Constantinople (1621), brought the Greek Church face to face with Reformation theology. Cyril conceived the plan of reforming the Eastern Church by bringing its doctrines into harmony with those of Calvinism, and by sending able young Greek theologians to Switzerland, Holland and England to study Protestant theology. His scheme of reform was opposed chiefly by the intrigues of the Jesuits, who in the end brought about his death. The Church anathematized his doctrines, and in its later testimonies repudiated his confession on the one hand and Jesuit ideas on the other. The most important of these testimonies are (1) the Orthodox confession or catechism of Peter Mogila, confirmed by the Eastern patriarchs and by the synod of Polotsk (1643), and (2) the patriarch of Jerusalem’s reasons for the condemnation of Dositheus (1672). Besides these, the canons and catechisms of the Russian Church should be consulted, especially the catechism of Philaret, which since 1839 has been used in all the churches and schools in Russia. Founding on these doctrinal sources the teaching of the Orthodox Eastern Church is 1:

---
1 This summary has been taken, with corrections, from G. B. Winer, Comparative Darstellung des Lehrbegriffs der verschiedenen Kirchenritten (Leipzig, 1824, Eng. tr., Edin., 1837). Small capitals denote differences from Roman Catholic, italics differences from Protestant doctrine.
Christianity is a Divine revelation communicated to mankind through Christ; its saving truths are to be learned from the Bible and tradition, the former having been written, and the latter maintained uncorrupted through the influence of the Holy Spirit, who, by His inspiration, guided the Church in all its deductions.

The Church is one, holy, catholic, and apostolic; its head is Christ; its solemnities, which are religious observances observed in the Church, belong to the Church, which is taught by the Holy Spirit, but every believer may read the Scriptures.

According to the Christian revelation, God is a Trinity, that is, one God with three persons. These persons are equal in nature and dignity, the Father, the Son, and the Holy Ghost. The Holy Ghost proceeds from the Father only. Besides the Divine and the Holy Spirit, there is also another person, the Virgin Mary, and reverence (books) to their pictures and relics.

Man is born with a corrupt bias which was not his at creation; the first man, created, possessed immortality, perfect wisdom, and a will regulated by reason. Through the first sin Adam and all his descendants lost immortality, and he will receive a bias towards evil.

In this natural state, man, who even before he actually sins is a sinner before God by original or inherited sins, commits manifold actual transgressions; but he is not absolutely wicked, for God wills towards good, and the Holy Ghost, the divine help is offered to all men without distinction, and may be rejected. In order to attain to salvation, man is justified, and when so justified can do no more than the commands of God. He may fail, but he is justified through faith.

Regeneration is offered by the word of God and in the sacraments, which, under visible signs communicate God's invisible grace to Christians as commanded in the New Testament. There are seen mysteries or sacraments. Baptismally destroys original sin. In the Eucharist the body and blood of Christ are truly present. Other sacraments are administered to Christians, when they have satisfied the Church of their case. Repentance, which is not merely (i) sincere sorrow, but also (ii) confession of each individual sin to the priest, and (iii) the discharge of penances imposed by the priest for the removal of the temporal punishment, is conferred by the priest, and God and the Church, Penance accompanied by the judicial absolution of the priest makes a true sacrament.

The Church of Christ is the fellowship of all those who accept and transmit all the articles of faith as transmitted by the Apostles and approved by the General Synods. Without this visible Church there is no salvation. It is under the abiding influence of the Holy Ghost, and therefore cannot err in matters of faith. Spiritual services are celebrated in the name of the Lord Jesus Christ, at the command of Christ, and under the authority of the Church, and they form a threefold order, distinct jaws divine from other Christians, of Bishops, Priests and Deacons. The four Patriarchs, of equal dignity, have the highest rank among the bishops, and the patriarch of Rome, called the pope, is head of the Church and infallibly decides, under the guidance of the Holy Ghost, all matters of faith and ecclesiastical life. All ministers of Christ must be regularly called and appointed to their office, and are consecrated. Bishops must be unmarried, and Priests and Deacons must not be clerks in marriage. All priests in common belong, besides the preaching of the word, the administration of the six sacraments—baptism, confirmation, penance, eucharist, matrimony, and orders of the priests. Bishops and priests can receive penance. Ecclesiastical ceremonies are part of the divine service; most of them have apostolic origin; and those connected with the sacrament must not be omitted by priests under pain of mortal sin.

Liturgy and Worship.—The ancient liturgies of the Eastern Church were very numerous, and have been frequently classified.

J. M. Neale makes three divisions—the liturgy of Jerusalem or of St Irenaeus, that of Alexandria or of St Mark, and that of Edessa or of St Thaddaeus; and Daniel substantially agrees with him. The same precision for uniformity which suppressed the Gallican and Mozarabic liturgies in the West led to the almost exclusive use of the liturgy of St James in the East. It is used in two forms, a shorter revised by Chrysostom, and a longer called the liturgy of St Basil. This liturgy and the service generally are either in Old Greek or in Old Slavonic, and frequent disputes have arisen in particular districts about the language to be employed. Both sacred languages differ from the language of the people, but it cannot be said that in the Eastern Church worship is conducted in an unknown tongue—"the actual difference," says Neale, "may be about that between Chaucer's English and our own." There are eleven chief service books, and no such compendium as the Roman breviary. Fasting is frequent and severe. Besides Wednesdays and Fridays, there are four fasting seasons, Lent, Pentecost to SS. Peter and Paul, August 1-15 preceding the Feast of the Sleep of the Theotokos, and the six weeks before Christmas. Indulgences are not recognized; an intermediate and purificatory state of the dead is held but not systematized into a doctrine of purgatory. The Virgin receives homage, but the dogma of her Immaculate Conception is not admitted. While icons of the saints are found in the churches there is no "graven image" apart from the crucifix. There is plenty of singing but no instrumental music. Prayer is offered standing towards the East; at Pentecost, kneeling. The celebration of the Eucharist is an elaborate symbolical representation of the Passion. The consecrated bread is broken into the wine, and both elements are given together in a spoon.

The ritual generally is as magnificent as in the West, but of a monastic type. (For the liturgical dress see Vestments and subsidiary articles.)

Monastic Life.—Monasticism is, as it has always been, an important feature in the Eastern Church. An Orthodox monastery is perhaps the most perfect extant relic of the 4th century. The simple idea that possesses the monks is that of fleeing the world; they have no distinctions of orders, and though they follow the rule of St Anthony, K. Lake in Early Days of Monasticism on Mount Athos (1909) traces the development through three well-delineated stages in the 9th and 10th centuries—

(a) the hermit period, (b) the loose organization of hermits in laurias, (c) the stricter rule of the monastery, with definite buildings and fixed rules under an n holyer or abbot.

The monasteries now have taken over the name laurias. They are under the jurisdiction of the metropolitan; a few of the most important have a patriarch and are called Skautoepigia. The courts on Mt Sinai are absolutely independent. Apart from hermitages there are (1) קוספואיקא, monks who possess nothing, live and eat together, and have definite tasks given them by their superiors; (2) διαφρευκα, monks who live apart from each other, each receiving from the monastery fuel, vegetables, cheese, wine and a little money. They only meet for the Divine Office and on great feasts, and are the real successors of the laur system. The most famous monasteries are those on Mount Athos; in 1902 there were twenty lauras with many dependent houses and 7522 monks there, mainly Russian and Greek. The monks are, for the most part, ignorant and unlettered, though in the dark days of Mahomedan persecution it was in the monasteries that Greek learning and the Greek nationality were largely preserved. Since priests must be married and bishops must not, only monks are eligible for appointment to bishoprics in the Eastern Church. See further, Monasticism.

The Branches of the Church.—In addition to the ancient churches which have separated themselves from the Orthodox faith, many have ceased to have doctrinal or important connection, owing either to the conquests of Islam or to their absorption by other churches. For example, the Church of Mount Sinai may be regarded as all that survives of the ancient church of northern Arabia; the autocephalous Slavonic churches of Ipek and Okhrida, which derived their ultimate origin from the missions of Cyril and Methodius, were absorbed in the patriarchate of Constantinople in 1766 and 1767 respectively; and the Church of Georgia has been part of the Russian Church since 1801-1802. At the present day, then, the Orthodox Eastern Church consists of twelve mutually independent churches (or thirteen if we reckon the Bulgarian Church), using their own language in divine service (or some ancient form of it, as in Russia) and varying not a little in points of detail, but standing in full communion with one another, and united as equals in what has been described as one great ecclesiastical federation. However, in using such
language it must be remembered that we are not dealing with bodies which were originally separated from one another and have now entered into fellowship, but with bodies which have grown naturally from a single origin and have not become estranged.

A. THE FOUR ANCIENT PATRIARCHATES

1. The Patriarchate of Constantinople or New Rome.—The ancient patriarchate of Constantinople included the imperial dioceses of Pontus, Asia, Thrace and Eastern Illyricum—i.e. speaking roughly, the Byzantine province, a minor, and parts of the Aesernian and a small portion of Austria. The imperial diocese of Pontus was governed by the exarch of Caesarea, who ruled over thirteen metropolitans with more than 100 suffragan bishops. Asia was governed by the exarch of Ephesus, who ruled over twenty metropolitans with more than 350 suffragan bishops. In Asia Minor the church maintains but a small remnant of its former greatness; in Europe it is otherwise. The old outlines, however, are effaced wherever the Christian races have been settled. The national churches of Greece, Servia and Rumania have reorganized themselves on a new basis. Where the Turkish rule still prevails the church retains her old organization, but greatly impaired. Still the Oriental Patriarchates of Antioch and Alexandria, though called early in the 6th century, is the most exalted ecclesiastical of the Eastern churches, and his influence reaches far outside the lands of the patriarchate. His jurisdiction extends over the dominions of the Caliph of Bagdad, and his authority reaches the islands of the Aegean; there are eighty-two metropolitanos under him, and the "monastic republic" of Mount Athos. He has great privileges and responsibilities as the recognized head of the Greek community in Turkey, and enjoys many personages which have been lost since the end of the 6th century.

The patriarchate under the old Ottoman system had his own court at Phanar, and his own prison, with a large civil jurisdiction over, and responsibility for, the Greek community. In ecclesiastical affairs, the patriarch as head of the Holy Synod (Ιερό Συνόδος τῆς Ἑκκλησίας Κωνσταντινουπόλεως), consisting of twelve metropolitanos, six of whom are re-elected every year from the whole number of metropolitanos, arranged in three classes, has a precedence over the twenty-five members of the Patriarchal Mixed Council (Διεύθυνσις Ἐβδομάδος Συμβουλίων), a remarkable assembly, which is at once the source of great power by introducing a strong law element into the administration, and of a certain amount of influence in the liturgy, and by having the universal feeling. It consists of four metropolitanos, members of the Holy Synod, and eight laymen. All of these are chosen by an electoral body, consisting of all the members of the Holy Synod and the National Mixed Council, and two additional representatives are invited from the patriarchates of Constantinople. The election of the patriarch is also, to a considerable extent, popular. An electoral assembly is formed for the purpose consisting of the twelve members of the Holy Synod and the National Mixed Council. The election consists of a vote of eight representatives of as many dioceses (the remaining dioceses having only the right to nominate a candidate by letter), ten representatives of the patriarchates of Constantinople, ten representatives of all patriotic independence, two representatives of the Orthodox Christian trades of Constantinople, the two representatives of the secretariat of the patriarchate, and such metropolitanos, to the number of ten but no more, as happen to be in Constantinople at the time for representing the patriarch from the Deacon and deaconess of the patriarch, the Holy Synod and the National Mixed Council at once meet and elect a temporary substitute for the patriarch (Τυποφόρος). Forty days afterwards the electoral assembly meets, under his presidency, and proceeds to make a list of two by candidates (at the present day they must be metropolitanos), who may be proposed either by the members of the electoral assembly or by any of the metropolitanos of the patriarchate by letter. This list is sent to the sultan, who has by prescription the right to strike a name off the list before the rest in his discretion. The electoral assembly chooses three. These names are then submitted to the clerical members of the assembly, i.e. to the members of the Holy Synod and the πατριαρχικός συνέδριον, who meet in church, and in the usual order of ecclesiastical procedure, each one of the three is presented to the Porte, which thereupon grants the biretta or diploma of investiture and several customary presents; after which the new ruler is enthroned. The patriarch has the assistance and support of the sultan. He has a civil and military service (he is called a camel). The sultan has also a personal residence in the patriarchal residence, and he is also entitled to receive presents from the patriarch. The sultan can also attack the patriarch's property, but only in districts under his jurisdiction. The sultan cannot introduce a new candidate without the permission of the patriarch. In the form of the assembly the patriarch is supported by his chancellor, the biretted metropolitanos (πατριάρχης), who receives him as delegate in the liturgy and presents candidates for orders; the grand visier (μεγάλος σελερλόφ), who superintends the administration of the empire; the director of the mint (σελερλόφ), who superintends the fiscal and commercial concerns of the empire; the biretted metropolitanos (πατριάρχης), who superintends the ecclesiastical concerns; the deputy, who is the master of the ceremonies (πρωτοκόλλογος), who supervises the nomenclature; the prothonotary (πρυτανήπορος), who supervises the notaries (πρυτανήπορος); the archdeacon, who superintends the ecclesiastical concerns; the biretted metropolitanos (πατριάρχης); the secretary (ευφυεμονημονήτης); and the chief synod (πρυτανήπορος).

2. The Patriarchate of Alexandria, consisting of Egypt and its dependencies, was at one time more powerful, but it is now the most centralized, of all, and the patriarch still preserves his ancient titles of "pope" and "father of fathers, pastor of pastors, archbishop, archpriest, thirteenth apostle, and eccumenical judge." The patriarchate of Alexandria is composed of the metropolitanos of Alexandria, Thessalonica, and the rest of Greece, Thessaly, Epirus, and the islands of the Aegean. The patriarch is the head of the community of the Coptic Church, and the Mahomedan conquest of Egypt, have left him but the shadow of his former greatness; and at the present time he has only the bishop of Libya under him, and rules over about 100,000 people at the outside, most of whom are settlers from elsewhere.

3. The Patriarchate of Antioch has undergone most changes in extent of jurisdiction, arising from the transfer of sees to Jerusalem, when the progress of the Saracens forced the flight of the patriarch from the conquests of the Mahomedans. At the height of his power the patriarch of Antioch ruled over 12 metropolitanos and 250 suffragan bishops. In the time of the first crusade 153 still survived; while in the days of the Mahomedans 50 were suffragan bishops. The patriarch, though he is "father of fathers and pastor of pastors, thus retains little of his old importance. His jurisdiction includes Cilicia, Syria (except Palestine) and Mesopotamia. Cyprus has been added to the diocese of Antioch under the council of Ephesus.

4. The Patriarchate of Jerusalem is the last of the patriarchates of the church, ecclesiastical followed civil divisions so closely that Jerusalem, in spite of the sacred associations connected with it, was, at the time of the Crusades, the ordinary bishopric dependent on the patriarchate of Jerusalem. Ambitious peculiarities, however, were permitted to advance the pretensions of their see, but it was not until the council of Chalcedon, in 451, that Jerusalem was made a patriarchate with jurisdiction over Palestine. From this time on to the inroad of the Saracens the patriarchate of Jerusalem was largely proscripted. It ruled over three metropolitanos with eighty suffragan bishops. The modern patriarch has under his jurisdiction 5 archbishops and 5 bishops. The chief importance of the patriarchate is derived from the position of Jerusalem, as the place of pilgrimage.

B. THE NINE NATIONAL CHURCHES

G. Finlay, in his History of Greece, has shown that there has been always a very close relation between the church and national life. Christianity from the first connected itself with the social organization of the people, and therefore in every province assumed the character of that region. In this way it was able to command at once individual attachments and group loyalty. This feeling died down to some extent when Constantine made use of the church to consolidate his empire. But it revived under the persecution of the Arianic emperors. The struggle against Arianism was not merely a struggle against theological orthodoxy, but quite naturally, it restored to the church the lost national supremacy. Dean Stanley was probably correct when he described the heretical churches of the East as the ancient national church of Egypt, Syria, and Armenia in revolt against the predominating church of the Greek-speaking Empire. This supremacy, in the East, as in Scotland, the history of the church is the key to the history of the nation, and in the freedom of the church the Greek saw the freedom and supremacy of his race. Whenever the Christian Empire of Crete (Theodosius I), which is already acknowledged as a Christian state, but is not the Byzantine Empire, includes various small Christian churches which are independent of the patriarchate, it is still a power to be reckoned with.

1. The ancient Church of Cyprus (see CYPRIAN, CHURCH OF).

2. The Church of Mount Sinai, consisting of little more than the monastery of St Catherine, under an archbishop who frequently resides in Egypt, but is in the possession of the patriarches of Sinai (μοναστήριον) in Turkey and Greece. The archbishop is chosen, from a list of candidates submitted by the monks of St Catherine, by the patriarch of Jerusalem and his Synod; and the patriarch consecrates him.

3. The Hellenic Church.—The constitution of the Church of the Hellenic Church is the result of the peculiar position of the patriarchate of Constantinople. The war of liberation was sympathized in, not by the indigenous population, but by the Greek-speaking Christians in the East. But the patriarch was in the hands of the Turks; he had been appointed by the sultan, and he was compelled...
by the Turkish authorities to ban the movement for freedom.

When the Greeks achieved independence they refused to be subject ecclesiastically to a patriarch who was nominated by the sultan (June 9, 1825); and, to add to their difficulties, there were in the country twenty-two bishops who had been consecrated by a patriarch in Constantinople to whom the Russians were opposed and who continued their episcopal jurisdiction irregularly during the war, and about twenty bishops who had been deprived of their sees during the troubles—i.e. fifty-three bishops claimed to be provided for. In these circumstances the government and people resolved to establish a college of bishops and make the patriarchal see an additional provisional see. They also resolved that the church should be governed after the fashion of the Russian Church by a synod; and they decreed that the king of Greece was to be head of the church, and that the synod was to convene independently and gradually. The patriarch of Constantinople in 1830 acknowledged the independence of the church, which gradually grew to be more independent of the state. By the Greek constitution of 1836 the Orthodox Church of Greece became indisputably united, as regards dogmas, to the Great Church of Constantinople, and to every other church professing the same doctrines, and, like these churches, it preserves in its integrity the strong influence of the patriarch, as it is more or less independent of state and the Tsar of Russia.

Patriarch Constantine in 1830 acknowledged the independence of the church, which gradually grew to be more independent of the state. The Holy Synod of Moscow refused to recognize the patriarchal independence and consecrated a bishop in Russia. Nevertheless, the Great Church of Constantinople dares not excommunicate Russia, but the chief of its many grievances against that country is its patronage of the Bulgarian exarchate. The Bulgarians of course say they are not subject to such official co-operation, but the bishop of a see subject to such spiritual and temporal co-operation has no right to say that he is independent; it is probably in the very nature of things that where there is co-operation the spiritual authority must, for the sake of the peace and good order of the state, have some voice, and therefore it is not surprising that the Bulgarians have not excommunicated the Patriarch. Present Position of the Orthodox Church. Although the signs of weakness which have characterized the other churches are still present, there are some indications of improvement. The encyclical on unity of Pope Leo XIII. (1895) called forth a reply from the patriarch Anthimus V. of Constantinople and his Synod, which was eminently learned, dignified and charitable. The theological school of the patriarchate, at Halke, is not distinguished, and the University of Athens has a good record. While the parochial clergy are still as unlearned as ever, there are not a few amongst the higher clergy who are distinguished for zeal and learning. The metropolitan of Bucharest, of Moldavia and Wallachia, was made a metropolitan in 1831. The union of the two principalities under Aleksandru Couza (December 1861) the Church was declared autocephalous under a metropolitan at Bucharest; and the freedom of religious worship was guaranteed by the treaty of Berlin. The Union of the two principalities was confirmed by the treaty of Berlin. The Church was declared autocephalous under a metropolitan at Bucharest; and the freedom of religious worship was guaranteed by the treaty of Berlin. The autonomy of the two principalities was confirmed by the treaty of Berlin. The Church was declared autocephalous under a metropolitan at Bucharest; and the freedom of religious worship was guaranteed by the treaty of Berlin. The autonomy of the two principalities was confirmed by the treaty of Berlin. The Church was declared autocephalous under a metropolitan at Bucharest; and the freedom of religious worship was guaranteed by the treaty of Berlin. The autonomy of the two principalities was confirmed by the treaty of Berlin. The Church was declared autocephalous under a metropolitan at Bucharest; and the freedom of religious worship was guaranteed by the treaty of Berlin.

The Church of Montenegro. The Church of Montenegro has already been mentioned. The Church of Montenegro has already been mentioned. The Church of Montenegro has already been mentioned. The Church of Montenegro has already been mentioned. The Church of Montenegro has already been mentioned.

The Orthodox Church in Austria-Hungary, which, however, consists of four independent sections: the Servians of Hungary and Croatia, under the patriarch of Karlovitz; the Rumanians of Transylvania, under the metropolitan of Bukovina; the Rumanians of Transylvania, under the metropolitan of Bukovina; the Rumanians of Transylvania, under the metropolitan of Bukovina; and the Servians of Bosnia-Herzegovina, who have four sees, that of Sarajevo holding the principal see.

The Servian Church. The Servian Church dates from 992, when Prince Vladimir and his people accepted Christianity. The metropolitan, who was subject to the patriarch of Constantinople, resided at Kiev on the Dnieper. During the Tartar invasion the metropolitan was destroyed, and the metropolitan seat was transferred to Novgorod. In 1220 the Servians fixed their seat at Moscow. In 1582 Meriakh, patriarch of Constantinople, raised Job, 46th metropolitan, to the patriarchal dignity; and the act was afterwards confirmed by a general council of the Church. But the metropolitan did not reside at Moscow, and its power and its independence were equal to that of the metropolitan. In 1700 Peter the Great forbade the election of a new patriarch, and in 1721 he established the Holy Governing Synod to supply the place of the patriarch. This body has its seat in Constantinople, and the bishop representing the emperor, the metropolitan of Kiev, Moscow and St Petersburg, the archbishop of Georgia and five or six other bishops appointed by the emperor. There are altogether some 90 bishops and about 450,000 clergy, who are about 50,000 priests and 249 convents of nuns. The Church of Georgia, which has existed from a very early period, and was founded in 1801, was subject to the patriarch of Antioch and then on the independence of the church was recognized by the Synod of Chalcedon. Its head, the archbishop of Tiflis, bears the title of patriarch of Georgia, and has under him four suffragans. A petition was presented to the emperor by the Georgians in 1904 asking for the restoration of their church and their language, but nothing came of it.

The Bulgarian Church. The Bulgarian Church, unless indeed it be classed with the separated churches, it differs from the national churches already mentioned in that it has its origin in a revolt of Turkish subjects against the Sultan. The claim of the patriarch of the Bulgarians had occupied an anomalous position on the borders of the Eastern and Western Christendom, but they had ultimately become subject to Constantinople. The revival of Bulgarian national feeling reached its height in the 18th century, and led towards the recognition of independence, the leaders of which were the archimandrite Neophyt Bozveli and the bishop Ilarion Mikhailovsky. The Pope espoused the cause of the Bulgarians, partly to pacify them, but still more to strengthen his position on the whole Christian Church. As soon as the recognition of independence was consummated, the patriarchs who had previously occupied the patriarchal throne from 1878 to 1884, when he was deposed under the influence of the Old Catholics, were not very well received, and in 1905 an attempt was made to depose him. The sultan Abd-ul-Hamid, to whom the different parties appealed, 1

1 H. Brailsford, in Macedonia (London, 1906) brings a crushing indictment against the Patriarchal party.

2 For a different opinion see A. Fortescue, The Orthodox Eastern Church, 435 sqq.
lectured them on charity and concord! The patriarch's great rival was Joachim of Ephesus. Undoubtedly the question of the most pressing importance with regard to the future of Eastern Christendom is the relation between Russia and Constantinople. The Oecumenical Patriarch is, of course, officially the superior; but the Russian Church is numerically by far the greatest, and the tendency to regard Russia as the head, not only of the Slav races, but of all orthodox nations, inevitably reacts upon the church in the form of what has been called pan-Orthodoxy. The Russian Church is the only one which is in a position to display any missionary activity. It has been a powerful factor in the development of several of the churches already spoken of, especially those of Servia and Montenegro, which are usually very much subject to Russian influences ('Ρωσικά όψεις and 'Ρωσικά φύλακια'). It has taken great interest in non-orthodox churches, such as those of Assyria, Abyssinia and Egypt. Above all, it has shown an increasing tendency to intervene in the affairs of the three lesser patriarchates.

In America the Russian archbishop, who resides in New York, has (on behalf of the Holy Synod) the oversight of some 150 churches and chapels in the United States. Alaska is under the bishop of Danville in New York. But the first Russian bishop on the continent was Archbishop Tikhon of Sitka. He is residing at Sitka, one for Orthodox Syrians residing in Brooklyn. There are 75 priests and 46,000 registered parishioners. The English language is increasingly used in the services. The increase of Orthodox communities has been very marked since 1888 owing to the immigration of Austrian Slavonians. Those of Greek nationality have churches in New Orleans, Chicago, New York, Boston, Lowell (Massachusetts) and other places. If, as seemed likely in 1910, in addition to the Russian and Syrian bishops, Greek and Servian ones were appointed, an independent synod could be formed, and the bishops could elect their own metropolitan. The total number of "Orthodox" Christians in North America is estimated at 300,000. Many of them are Austrian and Hungarian Uniates, who, after emigrating, have shown a tendency to separate from Rome and return to the Eastern Confession. One reason for this tendency is the attempt of the Roman Church to deprive the Uniates in America of their married priests.

The Oxford movement in the Church of England early raised the question of a possible union between the Anglican and Eastern Orthodox Churches. Into the history of the efforts to promote this end, which have never had any official sanction on the one side or the other, it is impossible to enter here. The obstacles would seem, indeed, to be insurmountable. From the point of view of Orthodoxy the English Church is schismatical, since it has seceded from the Roman patriarchate of the West, and doubly heretical, since it retains the obnoxious Filioque clause in the creed while rejecting many of the doctrines and practices held in common by Rome and the East; moreover, the Orthodox Church had never admitted the validity of Anglican orders, while not denying it. Union would clearly only be possible in the improbable event of the English Church surrendering most of the characteristic gains of the Reformation in order to ally herself with a body, the traditions of which are almost wholly alien to her own. At the same time, especially as against the universal claims of the papacy, the two churches have many interests and principles in common, and efforts to find a modus vivendi have not been wanting on either side. The question of union was, for instance, more than once discussed at the unofficial conferences connected with the Old Catholic movement (see old catholics). These and other discussions could have no definite result, but they led to an increase of good feeling and of personal intercourse. Thus, on the coronation of the emperor Nicholas II. of Russia in 1894, Dr Creighton, bishop of Peterborough, as representative of the English Church, was treated with peculiar distinction, and the compliment of his visit was returned by the presence of a high dignitary of the Russian Church at the service at St Paul's in London on the occasion of Queen Victoria's "diamond" jubilee in 1897. In 1899 there was further an interchange of courtesies between the archbishop of Canterbury and Constantine V., patriarch of Constantinople. To promote the "brotherly feeling between the members of the two churches," for which the patriarch expressed a desire, a committee was formed under the presidency of the Anglican bishop of Gibraltar.

On this question of reunion see A. Fortescue, The Orthodox Eastern Church, 257 sqq., 429 sqq.

AUTHORITIES.—For the origins of the Eastern Church and the early controversies see the authorities cited in the article CHURCH HISTORY. For the Filiotus controversy, J. G. Walch, Historia controversiarum de Processu Spiritus Sancti (Jena, 1751); E. S. Foulkes, "The History of Filiotus," in account of Filiotus, to the Oratory, London, 1867; C. Adams, Filiotus (Edinburgh, 1884); W. Nordenskiöld, Das Papsttum und Byzanz (Berlin, 1903); also P. Schaff's History of the Creeds of Christendom. The following are devoted specially to the history and condition of the Eastern Church: M. le Quien, Orientis Christianis (Paris, 1740); J. S. Askenazy, Bibliotheca Orientalis (Rome, 1710-1728); A. P. Stanley's Eastern Church (1861); J. M. Neale, The Holy Eastern Church (General Introduction, 2 vols.; Patriarchate of Alexandria, 2 vols.; and, published posthumously in 1873, Patriarchate of Antioch). For liturgy, see H. A. Daniel, Codex Liturgiae Eccl. Univ. in epimenev redactus (4 vols., 1847-1855); Leo Allatius, De libris et rebus Eccles. Graecarum dissertationes; F. E. Brightman, Eastern Liturgies (Oxford, 1896). For a bibliography; see also The Inns, 1897, 3, 367; and Die kirchlichen Bibliotheken (Berlin, 1898). See also J. Parpignol, L'Eglise Byzantine de 527 à 826 (Paris, 1887); J. A. Spalding, Der griechische Bestand tünchler Kirchen des Orients (1886; 2nd ed., Regensburg, 1904); W. F. Adeney, The Greek and Eastern Churches (Edinburgh, 1908); Adair Fortescue, The Orthodox Eastern Church (London, 1907), with a full bibliography, and Fortescue and H. C. Leake, The Orthodox Church (London, 1908); and M. Tamarat, L'Église Gorgienne, des origines jusqu'à nos jours. An interesting estimate of the Orthodox Church is given by A. Harnack in What is Christianity? For the festivals of the Greek Church see Mary Hamilton, Greek Saints and Their Festivals (1910).

ORTHOGRAPHY (from Gr. ὀρθός, right or straight, and γράμμα, to write), spelling which is correct according to accepted use. The word is also applied, in architecture, to the geometrical elevation of a building or of any part of one in which all the details are shown in correct relative proportion and drawn to scale. When the representation is taken through a building, it is known as a section, and when portions of the structure only are drawn to a large scale they are called details.

ORTHONYX, the scientific name given in 1820, by C. J. Temminck, to a little bird, which, from the straightness of its claws—a character somewhat exaggerated by him—its large feet and spiny tail, he judged to be generically distinct from any other form. The typical species, O. spinicuca, is from south-eastern Australia, where it is very local in its distribution, and strictly terrestrial in its habits. It is rather larger than a skylark, coloured above not unlike a hedge-sparrow. The wings are, however, barred with white, and the chin, throat and breast are in the male pure white, but of a bright reddish-orange in the female. The remiges are very short, rounded and much incurved, showing a bird of weak flight. The rectrices are very broad, the shafts stiff, and towards the tip divested of barbs. O. spaldingi from Queensland is of much greater size than the type, and with a jet-black plumage, the throat being white in the male and orange-rufous in the female. Orthonyx is a semi-terrestrial bird of weak flight, building a double nest of grass or mud on the ground. Insects and larvae are its chief food, and the males are described as performing dancing antics like those of the lyre-bird (q.v.). Orthonyx belongs to the Oscines division of the Passeres and is placed in the family Timelidæ.

(2.) ORTHOPTERA (Gr. ὀρθόπεδον, straight, and πτερόω, a wing), a term used in zoological classification for a large and important order of the class Hexapoda. The cockroaches, grasshoppers, crickets and other insects that are included in this order were first placed by C. Linné (1735) among the Coleoptera (beetles), and were later removed by him to the Hemiptera (bugs, &c.). J. C. Fabricius (1773) was the first to recognize the unnaturalness of these arrangements, and founded for the reception of the group an order Odonata. In 1806 C. de Geer applied to these insects the name Dermaptera (δερμάτηρα, a skin, and πτερόω); and A. G.
ORTHOPTERA

Olivier subsequently used for the assemblage the name Orthoptera, which is now much better known than the earlier terms. W. Kirby (1813) founded an order Dermaptera for the earwigs, which had formed part of de Geer's Dermaptera, accepting Olivier's term Orthoptera for the rest of the assemblage, and as modern research has shown that the earwigs undeniably deserve original separation from the cockroaches, grasshoppers, crickets, &c., this terminology will probably become established. W. E. Ericson and other writers added to the Orthoptera a number of families which Linné had included in his order Neuroptera. These families are described and their affinities discussed in the articles Neuroptera and Hexapoda (q.v.). In the present article a short account of the characters of the Dermaptera and Orthoptera is given, while for details the reader is referred to special articles on the more interesting families or groups.

The Dermaptera and the Orthoptera agree in having well-developed mandibles, so that the jaws are adapted for biting; in the incomplete fusion of the second maxillae (which form the labium) so that the parts of a typical maxilla can be easily made out (see the description and figures of the cockroach's jaws under Hexapoda); in the presence of a large number of excretory (Malpighian) tubes; in the firm texture of the forewings; in the presence of appendages (cerci) on the tenth abdominal segment; and in the absence of a metamorphosis, the young insect after hatching closely resembling the parent.

Order Dermoptera.

In addition to the characters just enumerated, the Dermaptera are distinguished by the presence of small but distinct maxillae (fig. 2, see Hexapoda, APTERA) in association with theowntongue (hypopharynx); by the forewings when present being modified into short quadrangular dytra without nervuration, the complex hindwings (fig. 1) being folded beneath these both longitudinally and transversely so that nearly the whole abdomen is left uncovered; and by the entirely mesodermal nature of the genital ducts, which, according to the observations of F. Meigen, open to the exterior by a small hole in the apex of the abdomen; the terminal part of the duct being single, either by the fusion of the primitive paired ducts or by the suppression of one of them. In the vast majority of the winged insects the terminal part of the genital system (vagina and ductus ejaculatorius) is unpaired and ectodermal. Thus the condition in the Dermaptera is more primitive than in any other Pterygota order except the primitive membrodrous (ovulident and vasa ductalis) of the Ephemeroptera, which are paired, by paired apertures as in the Crustacea. In the vast majority of the Dermaptera the cerci are—in the adult insect at least—stout, unjointed appendages forming a strong forceps (fig. 1) which the insect uses in arranging the hindwings beneath the elytra. In at least one genus the unjointed pincers of the forceps are preceded, in the youngest instar by jointed cerci. Very many members of the order are entirely wingless.

There are two families of Dermaptera. The Hemimeridae include the single genus Hemimerus (q.v.), which contains only two species of curious wingless insects with long, jointed cerci, found among the hair of certain West African rodents. The other family is that of the Periplaneta or earwigs (q.v.) in all of which the cerci are modified as a forceps, while wings of the characteristic form described above are present in many of the species.

Order Orthoptera.

The bulk of de Geer's "Dermoptera" form the order Orthoptera of modern systematists, which includes some 10,000 described species. The insects comprised in it are distinguished from the earwigs by their elongate, rather narrow forewings, which usually cover, or nearly cover, the abdomen when at rest, and also finer in texture than the hindwings. The hindwings have a firm costal area, and a more delicate anal area which folds fanwise, so that they are completely covered by the forewings when the insect rests. Rarely (in certain cockroaches) the hindwing undergoes transverse folding also. Wingless forms are fairly frequent in the order, but their relationship to the allied winged species is evident. The female of the common cockroach (fig. 3a) showing an interesting vestigial condition of the wings, which are but poorly developed in the male (fig. 3b). More important characters of the Orthoptera than the nature of the wings—characters in which they differ from the Dermaptera and agree with the vast majority of winged insects—are the absence of distinct maxillae and the presence of an unpaired ectodermal tube as the terminal region of the genital system in both sexes. The cerci are nearly always joined, and a typical insect ovispositor with its three pairs of processes is present in connexion with the vagina of the female. In many Orthoptera this ovispositor is very long and conspicuous (fig. 5). Information as to the internal structure of a typical orthopteron—the cockroach—will be found under Hexapoda.

Classification.—Six families of Orthoptera are here recognized, but most special students of the order consider that these should be rather regarded as super-families, and the number of families greatly multiplied. Those who wish to follow out the classification in detail should refer to some of the recent monographs mentioned below in the bibliography. There is general agreement as to the division of the Orthoptera into three sub-orders or tribes.

I. Phasmoidea.—This division includes the single family of the Phasmodea whose members, generally known as "stick-insects" (q.v.) and "leaf-insects" (q.v.), are among the best-known examples of their respective resemblance to "to be found in the whole animal kingdom. The prothorax is short and the mesothorax very long, the three pairs of legs closely similar, the wings often highly modified or absent, and the cerci short and unjointed. Each egg is contained in a case attached to a twig or stone and containing many chambers. From this curious habituation the young stage is called "pseudegg" and hang by threads till after their first moult (see Mantis). The Blattidae (fig. 3) or cockroaches (q.v.) form the second family of this division. Their are readily distinguished by the somewhat rounded prothorax beneath which the head is usually concealed, while the forelegs are unmodified. Sixteen eggs are enclosed together in a compact capsule or "purse" (fig. 4).

II. Saltatoria.—The three families included in this tribe are distinguished by their elongate and powerful hindlegs (fig. 5) which enable them to leap far and high. They are remarkable for the possession of complex ears (described in the article Hexapoda)
stridulating organs which produce chirping notes (see Cricket). The families are the Acrididae and Locustidae—including the insects familiarly known as locusts and grasshoppers (q.v.) and the Gryllidae or crickets (q.v.). The Acrididae have the feelers and the ovipositor relatively shorter, and possess only three or four body segments; their ears are situated on the first abdominal segment and the males stridulate by scraping rows of pegs on the inner aspect of the hind wing, over the sharp edges of the forewing nerves. The Locustidae (see Grasshopper, Katydid) have the feelers and often also the ovipositor very elongate; these have four-segmented; the ears are placed at the base of the fore wing and the stridulation is due to the friction of a transverse “file” beneath the base of the left fore wing over a sharp ridge on the upper aspect of the right. In some of these insects the wings are so small as to be useless for flight, being modified altogether for stridulation. The Gryllidae (fig. 5) are nearly related to the Locustidae, having long feelers and ovipositors.

and agreeing with the latter family in the position of the ears. The forewings are curiously arranged when at rest, the anal region of the wing lying dorsal to the insect and the rest of the wing being turned downwards at the sides (see Cricket).

Fossil History. The Orthoptera are a exceedingly interesting order of insects as regards their past history. In Palaeozoic rocks of Carboniferous age the researches of S. H. Scudder have revealed insects with the general aspect of cockroaches and phasmids, but with the two pairs of wings similar to those of Orthoptera in form. In the Mesozoic rocks (Trias and Lias) there have been discovered, remains of insects intermediate between those ancient forms and our modern cockroaches, the differentiation between forewings and hindwings having begun. In a few insects the wings appear therefore to have arisen from a primitive Isopteroidea condition.

ORTHOSTATAE—ORTOLAN

ORThOSTATAE (Gr. ὅρθοστατάς, standing upright), the term in Greek architecture given to the lowest course of masonry of the external walls of the naos or cela, consisting of vertical slabs of stone or marble equal in height to two or three of the horizontal courses which constitute the inner part of the wall.

ORTHOSTYLE (Gr. ὅρθος, straight, and στῦλος, a column), in architecture, a range of columns placed in a straight row, as for instance those of the portico or flanks of a classic temple.

ORTIGUEIRA, a seaport of north-western Spain, in the province of Corunna; on the northern slope of the Sierra de la Paladina, on the river Nera and on the eastern shore of the Ria de Santa Marta—a winding, rock-bound and much indented inlet of the Bay of Biscay, between Capes Ortelag and Vares, the northernmost headlands of the peninsula. The official total of the inhabitants of Ortigueira (18,426 in 1900) includes many families which dwell at some distance; the actual urban population does not exceed 2000. The industries are fishing and farming. Owing to the shallowness of the harbour large vessels cannot enter, but there is an important coal trading, despite the dangerous character of the coast-line and the prevalence of fogs and gales. The sea-bathing and magnificent scenery attract visitors in summer even to this remote district, which has no railway and few good roads.

ORTLER, the highest point (18,921 ft.) in Tirol, and so in the whole of the Eastern Alps. It is a great snow-clad mass, which rises E. of the Stelvio Pass, and a little S. of the upper valley of the Adige (whence it is very conspicuous) between the valleys of Trafal (N.W.) and of Sulden (N.E.). It was long considered to be wholly inaccessible, but was first conquered in 1804 by three Tirolese peasants, of whom the chief was Josef Pichler. The first traveller to make the climb was Herr Gebhard in 1805 (sixth ascent). In 1826 Herr Schebelka, and in 1834 P. K. Thurnviller attained the summit, but it was only after the discovery of easier routes in 1864 by F. F. Tuckett, E. N. and H. E. Buxton, and in 1865 by Herr E. von Moisjiosovics that the expedition became popular. Many routes to the summit are now known, but that usually taken (from the Payer Club hut, easily accessible from either Sulden or Trafal) from the north is daily traversed in summer and offers no difficulties to moderately experienced walkers. (W. A. B. C.)

ORTNIT, or Ortnt, German hero of romance, was originally Herinit or Harntit, the elder of two brothers known as the Hartungs, who correspond in German mythology to the Dioscuri. His seat was at Holmgard (Novgorod), according to the Thidreksage (chapter 45), and he was related to the Russian saga heroes. Later on his city of Holmgard became Garda, and in ordinary German legend he ruled in Lombardy. Harntit won his bride, a Valkyrie, by hard fighting against the giant Isung, but was killed in a later fight by a dragon. His younger brother, Harderi (represented in the late sagas as a potentiate called Ortfit), also killed Ortnt by killing the dragon, and then married his brother’s widow. Ortnt’s wooing was corrupted by the popular interest in the Crusades to an Oriental Brantafahrtsage, bearing a very close resemblance to the French romance of Huon of Bordeaux. Both heroes receive similar assistance from Alberich (Oberon), who supplanted the Russian Ilya as Ortnt’s epic father in middle high German romance. Neumann maintained that the Russian Ortnt and the Lombard king were originally two different persons, and that the incoherence of the tale is due to the welding of the two legends into one.

See editions of the Heldendicht and one of Ortnt and Wolfdietrich by Dr. J. L. Eden von Lindkauzen (Tübingen, 1866); articles in the Zeitschrift des Deutschen Altertums Instituts by K. Müllenhoff (xxii. pp. 344-354, 1865; xxiii. pp. 185-192, 1867); by J. Seemüller, (xxvi. 201-211, 1882), and by E. H. Meyer (xxxviii. pp. 85-87, 1894), and in Germania by F. Neumann (vol. xxvii. pp. 191-219, Vienna, 1882). See also the literature dealing with the history of Bordeaux.

ORTOLAN, JOSEPH LOUIS ELŽÉAR (1802-1873), French jurist, was born at Toulon, on the 21st of August 1802. He studied law at Aix and Paris, and early made his name by two volumes, Explication historique des instituts de Justinien (1827), and Histoire de la législation romaine (1828), the first of which has been frequently republished. He was made assistant librarian to the court of cassation, and was promoted after the Revolution of 1830 to be secretary-general. He was also commissioned to give a course of lectures at the Sorbonne on constitutional law, and in 1836 was appointed to the chair of comparative criminal law at the university of Paris. He published many works on constitutional and comparative law, of which the following may be mentioned: Histoire du droit constitutionnel en Europe pendant le moyen âge (1834); Introduction historique au cours de législation pénale comparée (1841); he was the author of a volume of poetry Les enfants de (1845). He died in Paris, on the 21st of March 1873.

ORTOLAN (Fr. ortolan, Lat. ortulanas, the gardener bird, from hortus, a garden), the Emberiza hortulana of Linnaeus, a bird celebrated for the delicate flavour of its flesh, and a member of...
of the Emberizidae, a Passerine family not separated by most modern authors from the Fringillidae. A native of most European countries—the British Islands (in which it occurs but rarely excepted)—as well as of western Asia, it is known in autumn presumably to the southward of the Mediterranean, though its winter quarters cannot be said to be accurately known, and returns about the end of April or beginning of May. Its distribution throughout its breeding-range seems to be very local, and for this no reason can be assigned. It was long ago found in France, and apparently with truth, to prefer vine-growing districts; but it certainly does not feed upon grapes, and is found equally in countries where vineyards are unknown—reaching in Scandinavia even beyond the Arctic circle—and then frequently occurs in corn-fields and their neighbourhood.

In appearance and habits it much resembles its congener the yellowhammer, but wants the bright colouring of that species, its head for instance being of a greenish-grey, instead of a lively yellow. The somewhat monotonous song of the cock is also much of the same kind; and, where the bird is a familiar object to the country people, who usually associate its arrival with the return of fair weather, they commonly apply various syllabic interpretations to its notes, just as our boys do to those of the yellow-hammer. The nest is placed on or near the ground, but the eggs seldom show the hair-like markings so characteristic of those of most buntings. Its natural food consists of beetles, other insects and seeds. Ortolans are netted in great numbers, kept alive in an artificially lighted, or darkened room, and fed with oats and millet. In a very short time they become enormously fat and are then killed for the table. It, as is supposed, the ortolan be the Miliaris of Varro, the practice of artificially fattening birds of this species is very ancient. In French the word ortolan is used so as to be almost synonymous with the English "bunting"—thus the Ortolan-de-neige is the snow-bunting (Plectrophanes nivalis), the Ortolan-de-riz is the rice-bird or "bobolink" of North America (Dolichonyx oryzivorus), so justly celebrated for its delicious flavour; but the name is also applied to other birds much more distantly related, for the Ortolan of some of the Antilles, where French is spoken, is a little ground-dove of the genus Chamaepelia.

In Europe the Beccafico (pig-eater) shares with the ortolan the highest honours of the dish, and this may be a convenient place to point out that the former is a name of equally elastic signification. The true Beccafico is said to be what is known in England as the garden-warbler (the Motacilla salticaria of Linnaeus, the Sylvia hortensis of modern writers); but in Italy any soft-billed small bird that can be snared or netted in its autumal plumage in the provinces in heronry grounds and cook-shops. The "beccafico," however, is not as a rule artificially fattened, and on this account is preferred by some sensitive taste of the Ortolan.

ORTON, JOSEPH (1717–1783), English dissenting minister, was born at Shrewsbury on the 4th of September 1717. He entered the academy of Dr Philip Doddridge at Northampton (q.v.), became minister of a congregation formed by a fusion of Presbyterians and Independents at High Street Chapel, Shrewsbury (1741), received Presbyterian ordination there (1745), resigned in 1766 owing to ill-health, and lived in retirement at Kildare until his death. He exerted great influence both among dissenting ministers and among clergy of the established church.

He was deeply read in Puritan divinity, and adopted Sabelian doctrines on the Trinity. Old-fashioned in most of his views, he disliked the tendencies alike of the Methodists and other revivalists and of the rationalizing dissenters, yet he had a good word for Priestley and Theophilus Lindsey. Among his numerous works are Letters to Dissenting Ministers (ed. by S. Palmer, 2 vols., 1806), and Practical Works (2 vols., with letters and memoir, 1842).

ORONO, a small seaport and episcopal see of the Abruzzi, Italy, in the province of Chieti, 12 m. direct E. of that town and 105 m. by rail S.S.E. of Ancona. Pop. (1901) 8697 (town); 15,523 (commune). It is situated on a promontory 230 ft. above sea-level, and connected with the port below by a wire-rape railway. From the ruined castle magnificent views to the south as far as the Punta di Penna can be obtained. The cathedral has been restored at various times, but preserves a fine portal of 1312 by a local artist, Nico Mancini. At one side of it is the Palazzo de Pirris with five pointed windows.

The town occupies the site of the ancient Ortona, a seaport of the Frantini; it lay on the Roman coast-road, which here turned inland to Anxanum (Lanciano), 10 m. to the S. The town suffered much from the ravages of the Turks, who laid it in ruins in 1566, and also from frequent earthquakes.

For discoveries in the neighbourhood see A. de Nino in Notizie degli Scavi (1888), 646. (T. As.)

ÖRTZEN, GEORG, BARON VON (1829— ), German poet and prose-writer, was born at Brunn ir Mecklenburg-Schwerin. He served as an officer of Prussian hussars (1850–1853), entered the consular service and after employment at New York (1879) and Constantinople (1880) was appointed to Marseilles (1881), and then to Christiania (1885), retiring in 1892. He published about thirty volumes, mostly of lyrics and aphorisms, including Gedichte (3rd ed. 1861), Aus den Kämpfen des Lebens (1868), Deutsche Träume, deutsche Siege (1876), Epigramme und Epipolae in Prosa (1880), Es war ein Traum (1902). His Erlebnisse und Studien in der Gegenwart (Leipzig, 1878) appeared under the pseudonym Ludwig Robert, and Nacht (Stuttgart, 1899), a collection of sonnets, under that of Stephen Ervéy.

ORURO, a department and town of Bolivia. The department is bounded N. by La Paz, E. by Cochabamba and Potosí, S. by Potosí, and W. by Chili; it forms a part of the ancient Titicaca lacustrine basin, and has an area of 10,127 sq. m., the greater part of which is semi-arid and covered with extensive saline deposits. It is bordered by Cordilleras on the E. and W., and by transverse ridges and detached groups of elevations on the N. and S. The slope and drainage is toward the S., but many of the streams are waterless in the dry season. The outlet of Lake Titicaca, the Desaguadero river, flows southward into Lake Pampa-Aullagas, or Poopo, on the eastern side of the department near the Cordiller de los Frailes. Lake Poopo is 12,139 ft. above sea-level, or 560 ft. lower than Titicaca, and its waters discharge through a comparatively small outlet, called the Laquahuquina, into the lagoon and saline morasses of Coipasa (12,057 ft. elevation) in the S.W. corner of the department. Oruro is almost exclusively a mining department, the country being too arid for agriculture, with the exception of a narrow strip in the foothills of the Cordillera de los Frailes, where a few cattle, mules and llamas, and a considerable number of sheep are reared. The mineral wealth has not been fully developed except in the vicinity of the capital, in the north-east part of the department, where there are large deposits of tin, silver and copper. Oruro being the second largest producer of tin in the republic. There are borax deposits in the western part of the department, but the output is small.

The capital of the department is ORURO, 115 m. S.S.E. (direct) of La Paz; it is an old mining town dating from the 17th century, when it is said to have had a population of 70,000. The census of 1900 gave it a population of 18,575, the greater part of whom are Indians. A considerable number of foreigners are interested in the neighbouring mines. The elevation of Oruro is 12,420 ft. above sea-level, and its climate is characterized by a short cool summer and a cold rainy winter, with severe frosts and occasional snow-storms. The mean annual temperature is about 43° F. Oruro is the Bolivian terminus of the Antofagasta railway (0.75 metre gauge), 574 m. long, the first constructed in Bolivia. A law of the 27th of November 1906 provided for the construction of other lines, of metre gauge, from La Paz (Viecha) to Oruro, from Oruro to Cochabamba, and from Oruro to Tupiza, making Oruro the most important railway centre in Bolivia. Oruro enjoys the nominal division of being one of the four capitals of the republic, an anomaly which was practically ended by the revolution of 1866, since which time the government has remained at La Paz.

ORVIETO (anc. Volsinii [q.v.], later Urbs Vetus, whence the modern name), a town and episcopal see of the province of Perugia, Italy, on the Paglia, 78 m. by rail N. by W of Rome. Pop. (1901) 8820 (town); 18,206 (commune). It crowns an isolated rock, 1353 ft. above sea-level, 640 ft. above the plain,
commanding splendid views, and is approached on the east by a
funicular railway from the station. The town is very picturesque,
both from its magnificent position and also from the unusually
large number of fine 13th-century houses and palaces which still
exist in its streets. The chief glory of the place is its splendid
cathedral, dedicated to the Virgin; it was begun before 1285,
perhaps by Arnolfo di Cambio, on the site of an older church; and
from the 13th till the 16th century was enriched by the labours
of a whole succession of great Italian painters and sculptors.
The exterior is covered with black and white marble; the interior
is of grey limestone with bands of a dark basaltic stone. The
plan consists of a large rectangular nave, with semi-circular
recesses for altars, opening out of the aisles, north and south.
There are two transeptal chapels and a short choir. The most
magnificent part of the exterior and indeed the finest polychrome
monument in existence is the west façade, built of richly-
sculptured marble from the designs of Lorenzo Maitani of Siena,
and divided into three gables with intervening pinnacles, closely
resembling the front of Siena cathedral, of which it is a reprodu-
cation, with some improvements. The beauty of the whole, the
beauty of the composition is yellow-red and its maturity rank as
the highest achievement of Italian Gothic. It was begun in
1326, but the upper part was not completed till the 16th century.
The mosaics are modern, and the whole church has suffered
greatly from recent restoration. The four wall-surfaces that
flank the three western doorways are decorated with very
beautiful sculpture in relief, once ornamented with colour, the
designs for which, according to Burckhardt, must be ascribed to
the architect of the whole, though executed by other (but still
Sienese, not Pisan) hands. The Madonna above the principal
portal falls into the same category. The subjects are scenes
from the Old and New Testaments, and the Last Judgment, with
Heaven and Hell. In the interior on the north, the Cappella del
Corporale possesses a large silver shrine, resembling in form the
cathedral façade, enriched with countless figures in relief and
subjects in translucent coloured enamels—one of the most
important specimens of early silversmith’s work that yet exists
in Italy. It was begun by Ugolino Vieri of Siena in 1327, and
was made to contain the Holy Corporal from Bolsena, which,
according to the legend, became miraculously stained with blood
during the celebration of mass to convince a sceptical priest of
the truth of the doctrine of transubstantiation. This is supposed
to have happened in 1263, while Urban IV was residing at
Orvieto; and it was to commemorate this miracle that the
existing cathedral was built. On the south side is the chapel of
S. Brizio, separated from the nave by a fine 14th-century wrought-
iron screen. The walls and vault of this chapel are covered with
some of the best-preserved and finest frescoes in Italy—among
the noblest works of Fra Angelico and Luca Signorelli, mainly
painted between 1450 and 1501—the latter being of especial
importance in the history of art owing to their great influence
on Michelangelo in his early days. The choir stalls are fine and
elaborate specimens of larsia and rich wood-carving—the work of
Antonio and Pietro della Minella (1431–1441). In 16th-century
sculpture the cathedral is especially rich, containing many
subjects and groups and altar-reliefs by Simone Mosca and
Ippolito Scalza, close by are two Gothic buildings, the bishop’s
palace (1264) and the Palazzo dei Papi (begun in 1296), the
latter with a huge hall now containing the Museo Civico, with
various medieval works of art, and also objects from the Etruscan
cemetery of the ancient Volosini (q.v.). The Palazzo Faina
has another interesting Etruscan collection. The Palazzo del
Comune is Romanesque (12th century), but has been restored.
S. Andrea and S. Giovanni are also Romanesque churches of
that century; both contain later frescoes. To the 12th century
belongs the ruined abbey of S. Severo, 1 m. south of the town. The
church of S. Domenico contains one of the finest works in
sculpture by Arnolfo del Cambio. This is the tomb with re-
cumbent effigy of the Cardinal Brago or De Bray (1282),
with much beautiful sculpture and mosaic. It is signed hoc opvs
PECTAT A RENVLVS. It was imitated by Giovanni Pisano in his
monument to Pope Benedict XI at Perugia. Among the later
buildings, a few may be noted by Sanmicheli of Verona, who
was employed as chief architect of the cathedral from 1599
to 1619. The two gabled façades of the Palazzo del Comune, which
have been converted into a public garden. The walls, now disused,
called Il pozzo di S. Patrizio, is one of the chief curiosities of
Orvieto. It is 200 ft. deep to the water-level and 42 ft. in
diameter, cut in the rock, with a double winding inclined plane,
so that asses could ascend and descend to carry the water from
the bottom. It was begun by the architect Antonio da San
Gallo the younger in 1527 for Clement VII, who fled to Orvieto
after the sack of Rome, and was finished by Simone Mosca under
Paul III.

The town appears under the name Orvii of Procopius
(Bell. Goth. ii. 11, &c.), who gives a somewhat exaggerated
description of the site, and as Urbis Vetus elsewhere after his
time. Belisarius starred out Vitiges in 539, and became master
of it. In 606 it fell to the Lombards, and was recovered by
Charlemagne. It formed part of the donation of the Countess
Matilda to the papacy. Communal independence had probably
been acquired as early as the end of the 10th century, but the
first of the popes to reside in Orvieto and to recognize its
communal administration was Hadrian IV, in 1157. It was then
governed by consuls, but various changes of constitution super-
vened in the direction of enlarging the governing body.
Its sympathies were always Guelfic, and it was closely allied
with Florence, which it assisted in the battle of Montapertò (1260),
and its constitution owed much to her model. In 1199 the first
podestà was elected, and in 1251 the first capitano del popolo.
There were considerable Guelfic and Ghibelline struggles even at
Orvieto, the latter party being finally destroyed in 1313, and
the representatives of the former, the Monaldeschi, obtaining the
supreme power. The territory of Orvieto extended from Chiusi
to the coast at Orbetello, to the Lake of Bolsena and the Tiber.
The various branches of the Monaldeschi continually fought
among themselves, however, and the quarrels of two of them
divided the city into two factions under the names of Muffati
and Mercorini, whose struggles lasted until 1460, when peace
was made. In 1347 the Medici handed it over to Orvieto and
ruined it. After this period Orvieto was peaceably ruled by
papal governors, and had practically no history. Owing to the
strong Guelfic sympathies of the inhabitants, and the inaccessible
nature of the site, Orvieto was constantly used as a place of refuge
for the popes. In 1814 it became the chief town of a district, in 1831 of
a province, and in 1860 with Umbria became part of the kingdom
of Italy, and became a subprefecture.

See L. Fumi, Il Duomo d’Orvieto e i suoi restauri (Rome, 1891; Orvieto, note storiche e biografiche (Città di Castello, 1891), and other
works.

ORYX (Gr. ὄργ, a pickaxe, hence applied to the animal),
the scientific name of a group of African antelopes of relatively
large size with long straight or scimitar-shaped horns, which
are present in both sexes, and long tufted tails. They are all
desert animals. The true oryx of classical writers was probably
the East and North-east African balsa-oryx (Oryx beisa), which
is replaced in South Africa by the gemsbuck (Oryx gazella). In
North Africa and Asia it is represented by the scimitar-horned
O. leucoryx or O. alcelaphus, and in Arabia by the small white oryx
(O. beatrix). See Antelope.

ORZESZKO or ORZESZKO, ELIZA (1841– ), Polish
novelist, was born near Grodno, of the noble family
of Pawlowski. In her sixteenth year she married Piotr Orzeszko,
a Polish nobleman, who was exiled to Siberia after the
insurrection of 1863. She wrote a series of powerful
novels and sketches, dealing with the social conditions of
her country. Eli Makover (1875) describes the relations between the Jews
and the Polish nobility, and Meir Esofowicz (1878) the conflict
between Jewish orthodoxy and modern liberalism. On the
Nienm (1888), perhaps her best work, deals with the Polish
aristocracy, and Lost Souls (1886) and Cham (1888) with rural
life in White Russia. Her study on Patriotism and Cosmo-
politanism appeared in 1880. A uniform edition of her works
appeared in Warsaw, 1884–1888.
OSAKA, or OSAKA, a city of Japan in the province of Settsu. Pop. (1908) 1,265,590. It lies in a plain bounded, except westward, where it opens on Osaka Bay, by hills of considerable height, on both sides of the Yodogawa, or rather its headwater the Aji (the outlet of Lake Biwa), and is so intersected by river-branches and canals as to suggest a comparison with a Dutch town. Steamers ply between Osaka and Kobe-Hiogo or Kobe, and Osaka is an important railway centre. The opening of the railway (1873) drew foreign trade to Kobe, but a harbour for ocean-steamers has been constructed at Osaka. The houses are mainly built of wood, and on the 31st of July 1909 some 12,000 houses and other buildings were destroyed by fire. Shin-sai Bashi Suji, the principal thoroughfare, leads from Kitahama, the district lying on the south side of the Tosabori, to the iron suspension bridge (Shin-sai Bashi) over the Dotom-bori. The foreign settlement is at Kawaguchi at the junction of the Shirinashi and the Aji. It is the seat of a number of European mission stations. Buddhist and Shinto temples are numerous. The principal secular buildings are the castle, the mint and the arsenal. The castle was founded in 1583 by Hideyoshi; the enclosed palace, probably the finest building in Japan, survived the capture of the castle by Ieyasu (1615), and in 1868 witnessed the executions of the Tokugawa shoguns; but in the latter year it was fired by the Tokugawa party. It now provides military headquarters, containing a garrison and an arsenal. The whole castle is protected by high and massive walls and broad moats. Huge blocks of granite measuring 40 ft. by 10 ft. or more occur in the masonry. The mint, erected and organized by Europeans, was opened in 1871. Osaka possesses iron-works, sugar refineries, cotton spinning mills, ship-yards and a great variety of other manufactures. The trade shows an increase commensurate with that of the population, which in 1877 was only 284,105.

OSAKA OBSTOMIE, a city of Miami county, Kansas, U.S.A., about 45 m. S. by W. of Kansas City, on the Missouri Pacific railway. Pop. (1900) 4191 (227 negroes); (1905, state census) 4857; (1910) 4046. A state hospital for the insane (1866) is about 1 m. N.E. of the city. The region is a good one for general farming, and natural gas and petroleum are found in abundance in the vicinity. Osawatomie was settled about 1854 by colonists sent by the Emigrant Aid Company, and was platted in 1855; its name was coined from parts of the words "Osage" and "Pottawatomie." It was the scene of two of the "battles" of the "Border War," and of much of the political violence resulting from the clashes between the "pro-slavery" and the "free-state" factions of Missouri and Kansas. On the 4th of June 1856 it was plundered by about 170 pro-slavery men from Missouri. On the 30th of August 1856 General John W. Reid, commanding about 400 Missourians, attacked the town. The attack was resisted by Captain John Brown (who had come to Osawatomie in the autumn of 1855) at the head of about 40 men, who were soon overpowered. Of Captain Brown's men four were killed and two were executed. The town was looted and practically destroyed. A park commemorating the battle was dedicated here on the 31st of August 1910.

OSBORN, SHERARD (1822-1875), English admiral and Arctic explorer, the son of an Indian army officer, was born on the 25th of April 1822. Entering the navy as a first-class volunteer in 1837, he was entrusted in 1838 with the command of a gunboat at the attack on Kedah in the Malay Peninsula, and was present at the reduction of Canton in 1841, and at the capture of the batteries of Woosung in 1842. From 1844 till 1848 he was gunnery mate and lieutenant in the flag-ship of Sir George Seymour in the Pacific. He took a prominent part in 1849 in advocating a new search expedition for Sir John Franklin, and in 1850 was appointed to the command of the steamer-tender "Pioneer" in the Arctic expedition under Captain Austin, in the course of which he performed (1851) a remarkable sledge-journey to the western extremity of Prince of Wales Island. He published an account of this voyage, entitled Stray Leaves from an Arctic Journal (1852), and was promoted to the rank of commander shortly afterwards. In the new expedition (1852-1854) under Sir Edward Belcher he again took part as commander of the "Pioneer." In 1856 he published the journals of Captain Robert M'Clure, giving a narrative of the discovery of the North-West Passage. Early in 1855 he was called to active service in connexion with the Crimean War, and being promoted to post-rank in August of that year was appointed to the "Medusa," in which he commanded the Sea of Azoff squadron until the conclusion of the war. For these services he received the C.B., the Cross of the Legion of Honour, and the Medjidieh of the fourth class. As commander of the "Furious" he took a prominent part in the operations of the second Chinese War, and performed a piece of difficult and intricate navigation in taking his ship 600 m. up the Yangtse-kiang to Hankow (1858). He returned to England in broken health in 1859, and at this time contributed a number of articles on naval and Chinese topics to Blackwood's Magazine, and wrote The Career, Last Voyage and Fate of Sir John Franklin (1860). In 1861 he commanded the "Donegal" in the Gulf of Mexico during the trouble there, and in 1862 undertook the command of a squadron fitted out by the Chinese government for the suppression of piracy on the coast of China; but owing to the non-fulfilment of the condition that he should receive orders from the imperial government only, he threw up the appointment. In 1864 he was appointed to the command of the "Royal Sovereign" in order to test the turret system of ship-building, to which this vessel had been adapted. In 1865 he became agent to the Great Indian Peninsula Railway Company, and two years later managing director of the Telegraph Construction and Maintenance Company. In 1873 he attained flag-rank. His interest in Arctic exploration had never ceased, and in 1875 he induced Commander Albert Markham to undertake a summer voyage for the purpose of testing the conditions of ice-navigation with the aid of steam, with the result that a new Arctic expedition, under Sir George Nares, was determined upon. He was a member of the committee which made the preparations for this expedition, and died a few days after it had sailed.

OSBORNE, a mansion and estate in the Isle of Wight, England, S.E. of the town of East Cowes. The name of the manor in early times is quoted as Austerborne or Oysterborne, and the estate comprised about 3000 acres when, in 1845, it was purchased from Lady Isabella Blackford by Queen Victoria. The queen subsequently extended the estate to nearly 5000 acres, and a mansion, in simple Palladian style, was built from designs of Mr. T. Cubitt. Here the queen died in 1901, and by a letter dated Coronation Day 1902, King Edward VII. presented the property to the nation. By his desire part of the house was transformed into a convalescent home for officers of the navy and army, opened in 1904.

In 1903 there was opened on the Osborne estate a Royal Naval College. The principal buildings lie near the Prince of Wales's Gate, the most royal stables being adapted to use as class-rooms, a mess-room, and other apartments, while certain adjacent buildings were also adapted, and a gymnasium and a series of bungalows to serve as dormitories, each accommodating thirty boys, were erected, together with quarters for officers, and for an attached body of marines. By the river Medina, on the Kingsdown portion of the estate, a machine shop and facilities for boating are provided.

At the church of St Mildred, Whippingham, 1½ m. S.S.E. of East Cowes, there are memorials to various members of the royal family.

OSCA LINGUA, or OSCAN, the name given by the Romans to the language of (1) the Samnite tribes, and (2) the inhabitants of Campania (excluding the Greek colonies) from the 4th century
B.C. onwards. We know from inscriptions that it extended southwards over the whole of the Peninsula, except its two extreme projections (see Brutus and Messapii) covering the districts known as Lucania and Fenitana, and the greater part of Apulia (see Lucania, Fentana, Apulia). Northwards, a very similar dialect was spoken in the Central Apennine region by the Paeligni, Vestini (q.v.) and others. But there is some probability that both in the North and in the South the dialect spoken varied slightly from what we may call the standard or central Oscan of Samnium. There can also be no reasonable doubt, though doubt has strangely been raised, that the popular farces at Rome called Atellanæa were acted in Oscan; Strabo (v. p. 233) records this most explicitly as a curious survival.

This name, for what ought probably to be called the Samnite or Safine speech, is due to historical causes, but is, in fact, incorrect. The Osci proper were not Samnites, but the Italic, Pre-Tuscan and Pre-Greek inhabitants of Campania. This is the sense in which Strabo regularly uses the name Oscan (cf. v. 247), so that it is quite possible that we should connect them with the other tribes whose Ethnica were formed with the -co-suffix and with the plebs of Rome (see Votisci and Rome).

For further evidence as to the history of the names Osci, Opici, see R. S. Conway, The Italic Dialects, p. 149.

The chief monuments of the language, as spoken in Campania, come from Pompeii, Nola, Capua and Cumae (q.v.). From the two towns last mentioned we have the interesting group of heraldic inscriptions, known as Indeæae (q.v.), and two interesting curses inscribed on stone plates and, so to speak, posted in graves, for conveyance to the deities of the Underworld. One of these may be quoted as a typical specimen of the Oscan of Campania:

From the memnima-Curse:—

luciis sphias
statis gavis nep fulum nep delkum puelans
luciis sphias nipelim seliam
delkum nep fulum puald.
nep memnim nep lam isel heriud.

(‘Lucius Octavius, Statius Gauius nee memorare nee indicare possint. Lucius Octavius Nouelium Velliam nee memorare nee indicare possint, nee monumentum nee sepulchrum (sibi adipiscatur)."

The language as spoken in Samnium may be illustrated by a few sentences from the Tabula Agonensis, now in the British Museum:—

statas pis set hartin kerrhin:
drevel tefraxati statir, drievel regreutar statir,
hodac tehodam, pellam xxphost,
dellac genelac statir.ussax parasial sahallum
tefuram alirre fulerpli akene sabakther,
suffasias as hirrom sabahore,
pethal kerrhil statir, ammel kerrhil statir,
fusual kerrhil statir, esbal patere statir.

(‘Qui ericti sunt in horto Cerealli. Iovi ugilari patrono (?) statua, Iovi Rectori statua, Hercule Cerealli statua, Pandae Hieris (?) statua, Duae Geneatae statua. In ara ignea crematio sancta altero quoque festo (an ‘anno’?) sanctur (an ‘sanctut’) dedicavit."

Debal consularibus, justa horum accurato, (‘a sanctur’) antiquor (?) Cerealli statua, Nutrici Cerealli statua, Floreæ Cerealli statua, Mercurio patri statua.’"

It remains to notice briefly (1) the chief characteristics which mark off the Osco-Umbrian, or, as they might more conveniently be termed, the Safine group of dialects, from the Latinian, and (2) the features which distinguish Oscan and the dialects most closely allied to it, e.g. North-Oscan (see Paeligni), from the Umbrian or (more strictly) Igynae dialect (see Iguvium).

(A.) Phonology.—1. The conversion of the Indo-European vowels into labials, e.g. Oscan and Umbrian p = Lat. quis; Osc. Umb. pod = Lat. guod.

Umb. petur-parsus = Lat. quadrupedius; Osc. kombened = Lat. convivium, from the Indo-European root *g*em-, Eng. come, Sanskrit gam-; Umb. ambusive bum = Sanskritīgam, Eng. cow, the Lat. bov.; bous; having been borrowed from some Safine dialect, since the pure Latin form would have been *bous*.

2. The extension or syncope (a) of short vowels in the second syllable of a word, e.g. Oscan opsed-, Umbrian osd-, from an Italic stem *opsad-*; to work, build," cf. Lat. opera, "work," and operdi (although this verb appears in Latin to have been invented only at a later period, e.g. Osc. operata, Lat. operata, from the Italic *medeosta-*; "iustus," beside Lat. modestus. (b) Of short vowels before s, Osc. hiru (pronounced hortu)= Lat. hortus; Umb. hiru= Lat. hircus; Osc. nom. pl. humans, O Lat. homines; Umb. abl. pl. humis = Lat. suis.

3. The reservation of * s before n, m and l (whereas in Latin it is lost); e.g. "compensation of something" of the Safine vowel when the change is medial; Umb. abanes, abl. pl. = Lat. ahens; Paelignian prisma (nom. sing. fem.)= Lat. prima; Osc. Sbisis = Lat. Labius.

4. Instead of Lat. -nd- we have in Osco-Umbrian -nn— in which the Umbrian patruus reproduces a well-known line (Miles Glor., v. 14, l. 993), distintem hominem, et dispensare; hence the gerundives, Osc. oponsanam = Lat. operandum. So Umbrian pihran, from pihannes (gen. sing. masc.), equivalent to Lat. pioni. It is not certain what the original group of sounds was in the Oscio-Umbrian and -nd- in Latin, nor whether this group of sounds, whatever it was (possibly -nj), became -nd- before it became -nn.

5. Final a became o in both Oscan (a) and Umbrian (often written u), e.g. Oscan vid = Lat. vies; Umb. adro (nom. pl. neut.) = Lat. atra.

6. &lt; 6. Italian ë became closer in Osco-Umbrian; in the Oscan alphabet it is denoted by a special sign ë, which is best reproduced by i (ad). Whether this was the mielin sign with an accent upon is frequently used). In the Umbrian alphabet (see Iguvium) it is variously written i and ë, and in the Latin alphabet, when used to write Oscan and Umbrian, we have e, ë, and occasionally even ei, e.g. Osc. figuratis = Lat. legitus; Umb. ëtrus = Lat. legitus; Umb. tief and tief = Lat. tres; N. Osc. sefle = Lat. sibi.

7. An original short ë in Osco-Umbrian became identical in quality, though not in quantity, with the vowel just described, and is written with just the same symbols in all the alphabets, e.g. Osc. ëld. Umb. ped. ë = Guid.

8. Precisely analogous changes happened with Latin ë and ì; the resulting vowel being denoted in Oscan alphabet both by u and by ë (V), in Umbrian alphabet ë, in Latin alphabet a.

It is well to add here one or two other characteristics in which Oscan alone is more primitive, not merely than Latin, but even than Umbrian.

(a) Oscan retains ë between vowels, whereas in both Latin and Umbrian it became r. In Oscan it seems to have become voiced, as it is represented by z in Latin alphabet, e.g. gen. pl. fem. egnauzam, "rerum"; egan, in Oscan alphabet egan, pers. infin. esse.

(b) Oscan retains the diphthongs oei, eoi, ou (representing both semantically and ou and ou even in unaccented syllables, e.g. abl. pl. felkhás, "muris"; dat. pl. diumpuls, "lymphs"; infin. deum "docere.

(c) Oscan retains final o, e.g. abl. masc. sing. dolid = Lat. dolo.

(B.) Morphology.—1. In nouns. (a) Considerable levelling has taken place between the consonantal and the ë-stems; thus the gen. pl. of Osc. terel (neut.) "terrains" is very much like that of the consonantal stem tangin-, "tangines." Conversely we have the abl. tanginud on the pattern of ë-stem ablatives, like dolid. (b) In the ë-stems and the ë-stems we have several primitive forms which are of direct Latin origin, e.g. Osc. terel = Lat. terrae; "in terra," "in via.

11. In verbs. (a) The formation of the infinitive in -ùm-, Osc. ëndurum; Umb. erungam (cf. English unger, Latin unger, unger; art LATIN LANGUAGE, § 32). (b) The formation of the future, and perfect future indicative respectively, with stems in -ëns- and -ës-; Oscan ëdêst, "dabit"; ëdutu ëribut; ëszenze (n.) = "cenzeunt"; ëfereut, ëferent, ëfereut; ësfekt, ësfekut, ësercit, ësercit; ëfureut, ëfureut". (c) Several new methods of forming the perfect vowel stems, e.g. the Oscan and Umbrian -f-perfects. Osc. 1st sing. perf. manumass, "manaui"; Osc. 2nd sing. amanu, "amanu"; Osc. 3rd pl. ënd- = Lat. fuit (cf. Umb. perf. subj. passive impersonal ëphab ë, "plum sit"). Other one formation occurs frequently in Oscan (from ë-verbs), whose origin is obscure. In this particular characteristic is ë-es, e.g. prëftatut, "proflauta;"

(c) and different interesting impersonal or semi-personal forms which ultimately developed into a full passive, e.g. Osc. ë sabotage, "scuareut aliques" governing an accusative; Umb. ërur, "faret alices" (see the section on the passive under Latin Language).

(C.) Syntax.—It may be said generally that there are very few if any peculiarities in the syntax of the Oscan and Umbrian inscriptions as compared with Latin usage, though a large number of familiar Latin idioms appear, such as the abl. absolute; the abl.
of circumstance, the genitive in judicial phrases, the use of the neut.
adj. as an abstract substantive, e.g. Oscar sakenom toticum, "optimum
publicum," i.e. "optima rei publicae ratio." In verbal forms the
same use of the gerundive combined with the noun appear to
represent the total verbal action, e.g. Umb. orcinum pace, pace, "acra planct
causa;" the usual sequence of gen. of. gen., i.e. the imperfect subj. in
Oriental Obliqua representing the fut. indic. in Oratio Recta (see
Cipps Abellam b 23, 25); and finally the use of the perf. subj.
in Osc. in prohibitions (nep faficat, "neue fecerit"), but also in
post. commands (Osc. suakfrj, see above).
Fuller accounts of the dialects in all these aspects will be found
most exhaustively in Von Planta, Grammatik der Osthoch-umbrischen
Dialekte (Strassburg, 1889—1897). Less fully, but very clearly
accurate in C. D. Buck's Oscan and Umbrian Grammar (Boston,
1897), gives a fuller account of the alphabets and their history,
A Conspectus of the Accidence and an account of the Syntax at some
length. (R. S. C.)

OSCAR I. (1799—1859), king of Sweden and Norway, was the
son of General Bernadotte, afterwards King Charles XIV.
of Sweden, and his wife, Eugénie Désirée Clary, afterwards Queen
Desideria. When, in August 1810, Bernadotte was elected
crown prince of Sweden, Oscar and his mother removed from
Paris to Stockholm (June 1811). From Charles XIII., the lad
received the title of Duke of Södermanland (Sudermania).
He quickly acquired the Swedish language, and, by the time he
reached manhood, had become a general favourite. His very
considerable native talents were developed by an excellent
education, and he soon came to be regarded as an authority on
all social-political questions. In 1839 he wrote a series of articles
on popular education, and (in 1841) an anonymous work, Om
Straff och straffanstalter, advocating prison reforms.
Twice during his father's lifetime he was viceroy of Norway. On
the 10th of June 1823 he married the princess Josephine, daughter
of Eugéne de Beauharnais, duke of Leuchtenberg, and
diagram of the kingdom more than any of his predecessors.
In foreign
affairs Oscar I. was a friend of the principle of nationality.
In 1848 he supported Denmark against Germany; placed Swedish
and Norwegian troops in cantonments in Fünen and North
Schleswig (1849—1850); and mediated the truce of Malmö
(August 26th, 1848). He was also one of the guarantors of the
integrity of Denmark (London protocol, May 8th, 1852). As
early as 1850 Oscar I. had conceived the plan of a dynastic
union of the three northern kingdoms, but such difficulties
presented themselves that the scheme had to be abandoned.
He succeeded, however, in reversing his father's obsequious
policy towards Russia. His fear lest Russia should demand a
stretch of coast along the Varanger Fjord induced him to remain
neutral during the Crimean War, and, subsequently, to conclude
an alliance with Great Britain and France (November 25th,
1855) for preserving the territorial integrity of Scandinavia.
Oscar I. died, having reigned for 34 years (Charles XV. and
Oskar Fredrik (Oscar II.), succeeded to his throne.

See T. Almén, Ätten Bernadotte (Stockholm, 1886); and C. E.
Akreli, Männe frans Carls XIV., Oscar I. och Carls XV., Lager
Stockholm, 1884, 1885. Also NORWAY (history) and SWEDEN
(history).

OSCAR II. (1820—1907), king of Sweden and Norway, son
of Oscar I., was born at Stockholm on the 21st of January 1829.
He entered the navy at the age of eleven, and was appointed
junior lieutenant in July 1845. Later he studied at the univer-
sity of Upsala, where he distinguished himself in mathematics.
In 1857 he married Princess Sophia Wilhelmina, youngest
daughter of Duke William of Nassau. He succeeded his brother
Charles XV. on the 18th of September 1872, and was crowned
in the Norwegian cathedral of Drøntholm on the 18th of July
1873. At his accession he adopted as his motto Brødræfolfens Vål,
"the welfare of the brother folk," and from the first he
realized the essential difficulties in the maintenance of the union
between Sweden and Norway. The political events which led
up to the final crisis in 1905, by which the thrones were separated,
dealt with in the historical articles under NORWAY and
SWEDEN. But it may be said that the peaceful solution eventu-
ally adopted could hardly have been attained but for the tact
and patience of the king himself. He declined, indeed, to permit
any prince of his house to become king of Norway, but better
relations between the two countries were restored before his
death, which took place at Stockholm on the 8th of December
1907. His acute intelligence and his aloofness from the dynastic
considerations affecting most European sovereigns gave the
king considerable weight as an arbitrator in international
questions. At the request of Great Britain, Germany and
the United States, Oscar II. was restored the chief justice of Samoa,
and he was again called in to arbitrate in Samoan affairs in 1889.
In 1897 he was empowered to appoint a fifth arbitrator if neces-
sary in the Venezuelan dispute, and he was called in to act as
umpire in the Anglo-American arbitration treaty that was
quashed by the senate. He won many friends in England by his
outspoken and generous support of Great Britain at the time of
the Boer War (1899—1902), expressed in a declaration printed in
The Times of the 2nd of May 1900, when continental opinion
was almost universally hostile.

Himself a distinguished writer and musical amateur, King
Oscar proved a generous friend of learning, and did much to
encourage the development of education throughout his
domains. In 1858 a collection of his lyrical and narrative
poems, Memorials of the Swedish Fleet, published anonymously,
gained the second prize of the Swedish Academy. His "Con-
tributions to the Military History of Sweden in the Years 1711,
1712, 1713," originally appeared in the Annals of the Academy,
and were printed separately in 1865. His works, which
included his speeches, translations of Herder's Cid and Goethe's
Tragedy Turco, and a play, Castle Crowns, were collected into
two volumes in 1875—1876, and a larger edition, in three volumes,
appeared in 1885—1888. His Easter hymn and some other
of his poems are familiar throughout the Scandinavian
countries. His Memoirs of Charles XII. were translated into English
in 1870. In 1885 he published his Address to the Academy of
Music, and a translation of one of his essays on music appeared in
Literature on the 15th of May 1900. He had a valuable collection
of printed and MS. music, which was readily accessible to
the historical student of music.

His eldest son, Oscar Gustavus Adolphus, duke of Wärmland
(b. 1838), succeeded him as Gustavus V. His second son, Oscar
(b. 1850), resigned his royal rights on his marriage in 1888
with a lady-in-waiting, Fröken Ebba Munck, when he assumed
the title of Prince Bernadotte. From 1892 he was known as
Count Wisborg. The king's other sons were Charles, duke of
Westergötland (b. 1861), who married Princess Ingeborg of
Denmark; and Eugéne, duke of Nerike (b. 1865), well
known as an artist.

OSCEOLA (a corruption of the Seminole As-so-ke-ho-lar,
meaning "black drink") (c. 1804—1838), a Seminole American
leader, in the second Seminole War, was born in Georgia,
next the Chattahoochee river. His father was an Englishman
named William Powell; his mother a Creek of the Red Stick
or Mikasuki division. In 1808 he removed with his mother
into northern Florida. When the United States commissioners
negotiated with the Seminole chiefs the treaties of Payne's
Landing (9th of May 1832) and Fort Gibson (28th of March
1833) for the removal of the Seminoles to Arkansas, Osceola
seized the opportunity to lead the opposition of the young
warriors, and declared to the U.S. agent, General Wiley Thomp-
son, that any chief who prepared to remove would be killed. At the Agency (Fort King, in Marion county) he became more violent, and in the summer at 1835 Thompson put him in irons. From this confinement he obtained his release by a profession of penitence and of willingness to emigrate. Late in November 1835 he murdered Charley Emathla (or Emartla), a chief who was preparing to emigrate with his people, and on the 28th of December he and a few companions shot and killed General Thompson. On the same day two companies of infantry under Major Francis L. Dade were massacred at the Wahoo Swamp near the Withlacoochee river, while marching from Fort Brooke on Tampa Bay to the relief of Fort King. In a battle fought three days later at a ford of the Withlacoochee, Osceola was at the head of a negro detachment, and although the Indians and negroes were repulsed by troops under General Duncan L. Clinch (1787–1849), they continued, with Osceola as their most crafty and determined leader, to murder and devastate, and occasionally to engage the troops. In February 1836 General Edmund P. Gaines (1777–1849), with about 1100 men from New Orleans, marched from Fort Brooke to Fort King. When he attempted to return to Fort Brooke, because there were not the necessary provisions at Fort King, the Indians disputed his passage, and were driven back to the Withlacoochee. In the same year Generals Winfield Scott and Richard K. Call (1791–1862) conducted campaigns against them with little effect, and the year closed with General Thomas Sidney Jesup (1818–1866) in command with 8000 troops at his disposal. With mounted troops General Jesup drove the enemy from the Withlacoochee country and was pursuing them southward toward the Everglades where several chiefs expressed a readiness to treat for peace. In a conference at Fort Dade on the Withlacoochee on the 5th of March 1837 they agreed to cease hostilities, to withdraw south of the Hillsborough river, and to prepare for emigration to Arkansas, and gave hostages to bind them to their agreement. But on the 2nd of June Osceola came to the camp at the head of about 200 Mikasuki (Miccosukee) and effected the flight of all the Indians there, about 700 including the hostages, to the Everglades. Hostilities were then resumed, but in September Brigadier General Joseph M. Hernandez captured several chiefs, and a few days later there came from Osceola a request for an interview. This was granted, and by command of General Jesup he was taken captive and was taken to a post at Fort Moultrie, at Charleston, South Carolina, where he died in January 1838. The war continued until 1842, but after Osceola's death the Indians sought to avoid battle with the regular troops and did little but attack the unarmed inhabitants.

See J. T. Sprague, The Origin, Progress and Conclusion of the Florida War (New York, 1848).

OSCHATZ, a town in the kingdom of Saxony, in the valley of the Döllitz, 36 m. N.W. of Dresden, on the trunk railway to Leipzig. Pop. (1905) 10,854. One of its three Evangelical churches is the handsome Gothic church of St Agedius, with twin spires. Sugar, felt, woolens, cloth and leather are manufactured, and there is considerable trade in agricultural produce. Four miles west lies the Kolmberg, the highest eminence in the north of Saxony.

See C. Hoffmann, Historische Beschreibung der Stadt Oschatz (Oschatz, 1872–1874); G. Tietze, Althistor.-Kunstwiss. und Amtsmannschaft Oschatz (Dresden, 1895).

OSCHERSLEBEN, a town of Germany; in the Prussian province of Saxony, on the Boden, 24 m. by rail S.W. of Magdeburg, and at the junction of lines to Halberstadt and Jerichow. Pop. (1905) 13,721. Among its industrial establishments are sugar-refineries, iron-foundries, breweries, machine-shops and brick works. Oshersleben is first mentioned in 823, and belonged in the later middle ages to the bishops of Halberstadt.

OSCILLA, a word applied in Latin usage to small figures, most commonly masks or faces, which were hung up as offerings to various deities, either for propitiation or expiation, and in connection with festivals and other ceremonies. It is usually taken as the plural of osculum (dimin. of os), a little face. As the oscula swung in the wind, oscilla came to mean to swing, hence in English "oscillation," the act of swinging backwards and forwards, periodic motion to and fro, hence any variation or fluctuation, actual or figurative. For the scientific problems connected with oscillation see Mechanics and Oscillograph.

Many oscilla or oscurals or different types of Bacchus or of different rustic deities, are still preserved. There is a marble osculum of Bacchus in the British Museum. Others still in existence are made of earthenware, but it seems probable that wax and wood were the ordinary materials. Small rudely shaped figures of wool, known as pilae, were also hung up in the same way as the oscilla.

The festivals at which the hanging of oscilla took place were:
1. The Seminitae Feriae, or sowing festivals, and the Paganato, the country festivals of the tutelary deities of the pagi; both took place in January. Here the oscilla were hung on trees, such as the vine and the olive, oak and the pine, and represented the faces of Liber, Bacchus or other deity connected with the cultivation of the soil (Virg. Georg. ii. 382–396).
2. The Feriae Latinae; in this festival were placed the effigies of the gods; cf. the Greek festival of Aoros (see Ergiös).
3. The festival of June, which was called osculatio because the swingers masked their faces (ox etale) out of shame.
4. At the Corpus Christi Festival (Fid. ex Fisti. ed. Muller, p. 239) that pilae and effigies viriles et muliebres are hung on the cross-roads to the Lares, the number of pilae equaling that of the slaves of the family, the effigies that of the children; the purpose being to induce the Lares to spare the living, and to be content with the pilae swoppers. The festival ends with the conclusion that the custom of hanging these oscilla represents an older practice of expiating human sacrifice. There is also no doubt a connexion with lustration by the purifying with air.

OSCILLOGRAPH. In connexion with the study of alternating or varying electric current, appliances are required for determining the mode in which the current varies. An instrument for exhibiting optically or graphically these variations is called an oscillograph, or sometimes an ondograph. Several methods have been employed for making observations of the form of alternating current curves—(1) the point-by-point method, ascribed generally to Jules Joubert; (2) the stroboscopic methods, of which the wave transmitter of H. L. Callendar, E. B. Ross, and E. Hospitalier were the prototypes; (3) the examination of the frequency galvanometer or oscillograph, which originated with A. E. Blondel, and are exemplified by his oscillograph and that of W. Duddell; and (4) purely optical methods, such as those of I. Fröhlich and K. F. Braun.

In the point-by-point method the shaft of an alternator, or an alternating current motor driven in step with it, is furnished with an insulating disk having a metallic slip inserted in its edge. Against this disk press two springs which are connected together at each end by the current, and give to each slip an assigned instant during the phase of the alternating current. This contact may be made to close the circuit of a suitable voltmeter, or to charge a condenser in connexion with it, and the reading of the voltmeter will therefore be the average or effective voltage of the alternator, but the instant during which the contact is closed will vary from that instant during the phase, determined by the position of the rotating contact slip with reference to the poles of the alternator. If the contact springs can be moved round the disk so as to vary the instant of contact, we can plot out the value of the observed instantaneous voltage of the machine or circuit in a wavy curve, showing the wave form of the electromotive force of the alternator. This process is a tedious one, and necessarily only gives the average for thousands of times. Hence in the Electrical Review, (1902), 50, 969.

of voltage which are performed rapidly during each period by the alternating current. The voltmeter needle may then be made to record its variations graphically on a drum covered with paper and so to delinate the wave form of the current. The process is analogous to the optical experiment of looking at a quickly rotating wheel or disk, in which the light from a slit passing through a glass mirror is shifted by the slippage of one edge of the mirror to the other. In a similar manner the current is diversified by shifting an alternate portion of its wave form faster than the object observed. We then see the engine going through all its motions but much more slowly, and can follow them easily. In another form devised by Callendar, a revolving contact disk is placed in the field of an electromotive force which is generated by the driven by the alternating current under test. A pair of contact springs are slowly shifted over so as to close the circuit at successive assigned instants during a complete phase. The electromotive force gives different phases of the alternating electromotive force, the pen follows and draws a curve delineating the wave form of that electromotive force or current. An instrument devised by E. B. Ross is not very different in construction. A commutator has been devised by T. R. Lyle (Phil. Mag., November 1903, 6, 517) in which at an assigned instant during the phase a selection is made from the periodic current and measured on a galvanometer.

The oscillographs of A. E. Blondele and W. Duddell operate on a different principle. They consist essentially of a galvanometer of which the needle or coil has such a short natural periodic time that it can follow all the variations of a current which runs through its cycle in say 1/1000 second. This needle or coil must be so damped that it does not oscillate within 1/1000 second after the current is cut off it returns to zero at once without over-shooting the mark. By means of an attached mirror and reflected ray of light the movable system can be indicated on a screen. This ray also has a given period of time, and by reflection from a separate oscillating mirror so as to make the two motions at right angles to one another, and thus we have depicted on the screen a bright line having the same form as the periodic current being tested. In W. Duddell's oscillograph (fig. 1) the galvanometer part consists of an electromagnet in the form of which is stretched a loop of very fine wire. To this is attached a mirror; hence, if a current goes up one side of a loop and down another, the wires are oppositely displaced in the field. The loop and mirror move in a cavity full of oil to render the system dead-beat. A ray of light is reflected from this mirror and from another mirror which is rocked by a small motor driven off the same circuit, so that the ray has two vibrations imparted to it at right angles, one a simple harmonic motion and the other a motion imparted by the electromagnetic force. The variation of the current or electromotive force under test. This ray can be received on a screen or photographic plate, and thus the wave form of the current is recorded. In the Duddell oscillograph it is usual to place a pair of loops in the magnetic field, each pair having its own mirror, so that a pair of curves can be delineated at the same time, and if there is any difference in phase between them, it will be detected. Thus we can take two curves, showing the potential difference at the end of an inductive circuit, and the other the current flowing through the circuit. In one form of Blondele's oscillograph, the vibrating system is a small magnetic needle carrying a mirror, but the principle on which it operates is the same as that of the instrument above described. The oscillograph can be made to exhibit optically the form of the current curve in non-linear phenomena, such as the discharge of a condenser. In this case the large vibrating mirror must be oscillated by a current from an alternator, on the shaft of which is a disc of conducting material with brass slips let into it and so arranged with condenser which each period of the alternator it is made, charging say a condenser and discharging it through the oscillograph. In this way an optical representation is obtained of the oscillatory discharge of the condenser. A form of thermal oscillograph has been devised by J. T. Irwin (Journ. Inst. Elec. Eng. Lond., 1917, 64, 116). This instrument that in each period of the alternator a contact is made, charging a condenser and discharging it through the oscillograph. In this way an optical representation is obtained of the oscillatory discharge of the condenser. A form of thermal oscillograph has been devised by J. T. Irwin (Journ. Inst. Elec. Eng. Lond., 1917, 64, 116).

3 See Assoc. Franc. pour l'Avanc. des Sciences (1898), for a paper on oscillographs describing Blondele's original invention of the oscillograph in 1891.

4 Electrician (1897), 39, 636.

Osh, a town of Russian Turkestan, in the government of Ferghana, 31 m. S.E. of Andijan railway terminus, at an altitude of 4030 ft. Pop. (1900) 37,307. It consists of two parts, native and Russian. Here begins a good road up to the Pamirs, practicable for artillery. The trade with China is considerable.

O'Shanassy, Sir John (1818–1883), British colonial statesman, was born in 1818 at Holycross Abbey, near Thurles, Tipperary, his father being a land surveyor. He married in 1839, and the same year emigrated to the Port Phillip district of New South Wales, where he was for some time engaged in farming, and subsequently commenced business in Melbourne. Dr Geoghegan, afterwards Roman Catholic bishop of Adelaide, induced him to take part in public affairs. He was one of the founders, and later the president, of the St Patrick's Society of Melbourne, and represented the Roman Catholic body on the denominational board of education. When Port Phillip was separated from New South Wales in 1851 and became the Colony of Victoria, O'Shanassy was appointed to the Legislative Council as one of the members for Melbourne. A few weeks after the new colony began its independent existence gold was discovered, and the local government had to solve a number of difficult problems. The legislature was composed partly of elected representatives, and partly of nominees appointed by the governor in council. The great natural ability of O'Shanassy forced him to the front, and for some time the policy of the country was virtually shaped by him and by Mr. (afterwards Sir) W. F. Stawell, the attorney-general. It was very much owing to the strong position taken by O'Shanassy that the Legislative Council was allowed to control not only the ordinary revenue raised by taxation, but also the territorial revenue derived from the sale and occupation of crown lands. From that date the Legislative Council, led by O'Shanassy, became virtually supreme. After the Ballarat riots in 1854, O'Shanassy was one of the members of a commission appointed to inquire into the condition of the gold-fields. The commission's report was the foundation of the mining legislation which, initiated in Victoria, was gradually followed by all the Australasian colonies. O'Shanassy, together with Sir Andrew Clarke, was one of the framers of the responsible government constitution. Under this constitution O'Shanassy was returned in 1856 to the Legislative Assembly for Melbourne and Kilmore, but took his seat for the latter constituency. Early in 1857 the Haines ministry, the first formed after the concession of responsible government, was defeated, and O'Shanassy formed a ministry of which he became the premier. But he was defeated after holding office for little more than six weeks. He returned to power in 1858 as chief secretary and premier. One of the first duties of the new ministry was to inaugurate the system of railways, and to raise the necessary funds for their construction. O'Shanassy decided to float a loan of eight millions sterling through the instrumentality of six of the Melbourne banks, and he began the series of borrowings by the Australian governments which subsequently attained such large proportions. In 1859 the ministry resigned, but in August 1861 O'Shanassy formed his third administration. During the two years that it held office the government passed an Education, a Local government, a Civil Service and a Land Act. The object of this last act was to abolish the system of selling the crown lands by auction, and to substitute another which insisted rather upon residence and cultivation than upon obtaining the highest possible price. The act did not carry out all the intentions of its framers, but it was a step in the right direction. The O'Shanassy government was defeated in June 1863, and its chief never again succeeded in regaining office. He did not stand at the general election of 1866, and paid a visit to Europe. In 1867 he returned to Victoria, and was elected to the Legislative Council. In 1870 he was created C.M.G., and in 1874 K.C.M.G. In the latter year he resigned his seat in the council, and did not re-enter public life until 1877, when he was returned to the Assembly for Belfast. His strongly expressed Conservative opinions and his devotion to the interests of the Roman Catholic church impaired his influence in the legislature, which had become extremely democratic during the eleven years that he had been absent from it; and although Sir John was a fearless critic of the policy of the government, he never succeeded in defeating it. He had a singularly comprehensive grasp of all constitutional questions, was an eloquent speaker and an ardent free-trader. He retired from parliament in 1880, and died in 1883.

O'Shaughnessy, Arthur William Edgar (1844–1881), English poet, was born in London on the 14th of March 1844, and at the age of seventeen obtained through the first Lord Lytton, who took a peculiar interest in him, the post of transcriber in the library of the British Museum. Two years later he was appointed to be an assistant in the natural history department, where he specialized in ichthyology. But his natural bent was towards literature. He published his Epic of Women in 1870, Lays of France, a free version of the Lais of Marie de France, in 1872, and Music and Moonlight in 1874. In his thirtieth year he married a daughter of John Westland Marston, and during the last seven years of his life printed no volume of poetry. Songs of a Worker was published posthumously in 1881, O'Shaughnessy dying on the 30th of January in that year from the effects of a chill upon a delicate constitution. O'Shaughnessy was a true singer; but his poems lack importance in theme and dignity in thought. His melodies are often magnificent; and, as in The Fountain of Tears, the richness of his imagery conceals a certain vagueness and indecision of the creative faculty. He was very felicitous in bold uses of repetition and echo, by which he secured effects which for haunting melody are almost inimitable. His spirit is that of a mild melancholy, drifting helplessly through the realities of life and spending itself in song. By some critics he has been disparaged, but reparation was done to his memory by Francis Turner Palgrave, who, in the second series of the Golden Treasury, said with some exaggeration that his matrimonial gift was the finest, after Tennyson, of any of the later poets, and that he had "a haunting music all his own."

Oshawa, a manufacturing town and port of entry of Ontario county, Ontario, Canada, on Lake Ontario and the Grand Trunk railway, 30 m. E.N.E. of Toronto. Pop. (1901) 4394. It contains flour, woolen and grist-mills, piano, farm implement and carriage factories, foundries, tanneries, canning factories, &c. There are a ladies' college and good schools.

Oshima, a group of three small islands belonging to Japan, lying southwards of Kiuishiu, in 30° 50' N. and 130° E. Their names, from west to east, are Kuroshima, Iwo-shima and Taka-shima. Kuro-shima rises to a height of 2475 ft., and Iwo-shima has an active volcano 2480 ft. high. These islands are not to be confounded with Oshima, the most northerly island of the Izu-noshichito, or with the northern group of the Luchu Islands. There are several other islands of the same name in Japan, Oshima signifying "big island." One of the best known lies off the southern promontory, and has been the scene of many maritime disasters.

Oshkosh, a city and the county-seat of Winnebago county, Wisconsin, U.S.A., about 75 m. N.N.W. of Milwaukee, on the W. shore of Lake Winnebago at the mouth of the Upper Fox river. Pop. (1900) 28,284, of whom 7356 were foreign-born (including 4500 from Germany), and 16,277 of foreign parentage (including 10,655 of German and 1015 of Bohemian parentage); (1910 census) 33,662. Oshkosh is served by the Chicago, Milwaukee & St Paul, the Chicago & Northwestern and the Minneapolis, St Paul & Sault Ste. Marie railways, by river steamboat lines connecting with other Fox River Valley cities, with the Wisconsin river at Portage, and with the Great Lakes at Green Bay, and by interurban electric lines connecting with Fond du Lac on the S., Green Bay on the N. and Omro on the W. The city lies on both sides of the Fox river, here spanned by six steel bridges, and stretches back to Lake Butte des Morts, an expansion of the Fox. North Park (60 acres), on the lake front,
is the most noteworthy of its parks; and there are Chautauqua grounds on the lake front. Yacht races take place annually on Lake Winnebago. Among the public buildings are the City Hall (1884), Office of the Wisconsin County, Public Library (1912, 60,000 volumes). Oshkosh is the seat of a State Normal School (1871), the largest in the state. The principal industries are the manufacture of lumber and of lumber products, although the former, which was once of paramount importance, has been declined with the cutting of neighbouring forests. In 1905 the value of the city's factory product was $8,706,705, the lumber, timber and planing mill products being valued at $4,671,003, the furniture at $751,511 and the wagons and carriages at $475,935.

Oshkosh is an important wholesale distributing centre for a large part of central Wisconsin. Farming and dairying are important industries in the vicinity.

Under the French régime the site of Oshkosh was on the natural route of travel for those who crossed the Fox-Wisconsin portage, and was visited by Marquette, Joliet and La Salle on their way to the Mississippi. There were temporary trading posts here in the 18th century. About 1827 the first permanent settlers came, and in 1830 there was a tavern, a store and a ferry across the river to Algoma, as the S. side of the river was at first called. The settlement was first known as Saukeer, but in 1840 its name was changed to Oshkosh in honour of a Menominee chief who befriended the early settlers and who lived in the vicinity until his death in 1856. The real prosperity of the place began about 1845 with the erection of two saw mills; in 1850 Oshkosh had 1450 inhabitants, and between 1860 and 1870 the population increased from 6086 to 12,663. In July 1874 and April 1875 the city was greatly damaged by fire.

**OSIANDER, ANDREAS** (1498–1552). German reformer, was born at Gunzenhausen, near Nuremberg, on the 10th of December 1498. His German name was Heiligmann, or, according to others, Hosemann. After studying at Leipzig, Altenburg and Ingolstadt, he was ordained priest in 1520 and appointed Hebrew tutor in the Augustinian convent at Nuremberg. Two years afterwards he was appointed preacher in the St Lorenz Kirche, and about the same time he publicly joined the Lutheran party, taking a prominent part in the discussion which ultimately led to the adoption of the Reformation by the city. He married in 1525. He was present at the Marburg conference in 1529, at the Augsburg diet in 1530 and at the signing of the Schmalkaldic articles in 1537, and took part in other public transactions of importance in the history of the Reformation; that he had an exceptionally large number of personal enemies was due to his vehemence, coherence and arrogance in controversy. The introduction of the Augsburg Interim in 1548 necessitated his departure from Nuremberg; he went first to Breslau, and afterwards settled at Königsberg as professor in its new university at the call of Duke Albert of Prussia. Here in 1550 he published two disputations, the one *De lege et evangelio* and the other *De justificação*, which aroused a controversy still unclosed at his death on the 17th of October 1552. While he was fundamentally at one with Luther in opposing both Romanism and Calvinism, his mysticism led him to interpret justification by faith as not an imputation but an infusion of the essential righteousness or divine nature of Christ. His party was afterwards led by his son-in-law Johann Funck, but disappeared after the latter's execution for high treason in 1566. Osianer's son Lukas (1534–1604), and grandsons Andreas (1560–1617) and Lukas (1571–1638), were well-known theologians.

Osiander, besides a number of controversial writings, published a corrected and enlarged edition of the Vulgate, with notes, in 1522, in a *Harmony of the Gospels*—the first work of its kind—in 1537. The best-known work of his son Lukas was an *Epitome of the Magdeburg Centuries*. See *The Life* by W. Möller (Elberfeld, 1870).

**OSIER** (through Fr. from Late Lat. osaria, osaria, a bundle of osier or willow twigs), the common term under which are included the various species, varieties and hybrids of the genus Salix, used in the manufacture of baskets. The chief species in cultivation are: *Salix similis* (the common osier) and *S. triandra*, *S. amygdalina*, *S. purpurea* and *S. fragilis*, which botanically are willows and not osiers. The first named with some forty of its varieties, formed until recent times the staple basket-making material in England. It is an abundant cropper, growing on low, thriving soil 15–30 ft. high. Full-topped and smooth, it is by reason of its pithy nature mainly cultivated for coarse work and is generally used as brown stuff. Some harder varieties, known as stone osiers and raised on drier upland soils, are peeled and used for fine work. *S. fragilis*, with some half-score varieties, is almost exclusively used by market gardeners for bunching greens, turnips and other produce. Owing to the increased demand for finer work much attention has been given (see Basket) in recent years to the cultivation of the more ligneous and tougher species, *S. triandra*, *S. purpurea* and *S. amygdalina* with their many varieties and hybrids.

It is commonly supposed that osiers or willows will prove remunerative and flourish with little attention on any poor, wet, marshy soil. This is, however, not the case. No crop responds more readily to careful husbandry and skilful cultivation. For the successful raising of the finer sorts of willows good, well-drained, loamy upland soil is desirable, which before planting should be deeply trenched and cleared of weeds. J. A. Krabe of Prummers near Aachen, the most scientific and practical of German cultivators, the results of whose experiments have been published in his admirable *Lehrbuch der rationalen Weidenkultur* (Aix-la-Chapelle, 1886, 2nd ed.) went so far as to show that the finest work could be turned out in the first year after converting the land and the 2nd and 3rd years. Vouchers were distributed from the University of Oxford, Kent, in a report dated the 18th of November 1800 (see *Jour. Soc. Arts*, 1801, xix., 75) stated that all kinds of willows invariably throw best on the driest spots of some wet land planted by him. Krabe found that in addition to loam, willows did well on dry ferruginous, sandy ground with a good top soil of about 6 in. in depth; on poor loamy clay, and even on peaty moors.

At any time, from late winter to early spring, the ground may be planted with "sets," i.e. cuttings of about 9 to 15 in. in length, taken from clean, well-ripened rods. These are firmly set to within 3 to 6 in. of the top in rows, 16 to 20 in. apart and spaced at intervals of 12 to 15 in. Yearling sets are largely planted, but the experiments of Krabe have proved, and the practice of the best Midland and West of England growers confirms, the superior productiveness of sets cut from two yearling rods. W. P. Ellmore of Leicester, the most experienced and enterprising of Midland cultivators, preferred to use the manure in his superior soil of clay with admixture of peat and the use of the horse hoe in both directions and a freer play of sun and air. Great care should be exercised in planting lest the bark be fractured, loosened or removed from the wood. The ground should be well prepared, the cuttings ranched and the rows set to a subject of periodic aluvial floods, manured yearly. The coarser *S. viminalis* may be raised on lowland soil if not water-logged or marshy, but the same attention to trencheding and weeding is imperative. Approved varieties of willows contain 50 to 175, 6d. per 1000 sets. The more valuable kinds are known as Black-top and introduced by Ellmore has been found to produce the heaviest crops on the best Leicester grounds.

Cutting and bedding take place in early winter after the fall of the leaf, the crop being known as green whole stuff. The coarser kinds are cut (or peeled) in autumn, the finer in early spring. The method the rods are left on the ground until spring advances, when a rapid growth of the cork cambium begins. They are then cut direct from the root and the bark is easily removed by drawing the rod through a suitably shaped hand-brake of smooth, well-rounded steel, framed in wood. Improved methods are used to strip two rods at a time. For the smaller sizes, rubber brakes are sometimes used and, for the very smallest, the fingers either bare or protected by linen bands. This method ensures a clean-cut unfractured rod. The usual practice in England is to work for proper time for cutting, the rods will remain double-skinned and the head may bleed. By the "pit" process the green rods are split upright in shallow pits of water at a depth of about 6 to 9 in. until the sap rises and growth begins, when they are ready for the brake. The defects of this method are that the tops are liable to split in the brake and the butts to remain foul. A third, known as the "pie" system enables the grower to bridge over the interval, and to keep his hands employed, between the end of the "head" and the
OSIMO—OSMAN

beginning of the "pit" stripplings. The willows are cut at the first indications of the sap rising and "couching" in rotten peelings and soil at a slight angle, the butts being on the ground, which should be strewed with damp straw from a manure heap. The tops are covered lightly with rotted peelings and by periodical applications of water, fermentation is induced at the bottom, heat is engendered, the leaves force their way through the covering and peeling may begin. Peeling is chiefly done by women and lasts from early May to the middle of July. After stripping, the rods are bleached in the sun and stores are covered with hay. White rods are then buried in great tanks of boiling water from 4 to 6 hours. They are then allowed to cool and mellow, are stripped and carefully dried in sun and air and remain dyed a rich tawny brown or buff colour. Brown rods may also be dyed in the same way, but they are not kept in large tanks of boiling water from 4 to 6 hours. The water, the temperature for the requisite period. Sticks (two or three yearling osiers) are also grown for whitening and buffing: the less ligeous varieties of S. vulgaris are best adapted for this purpose, worth £2. Osiers on the continent of Europe osiers or willows are bunched in sizes of one metre in girth at the butts and (except in Belgium) are also sold by weight.

The cost of planting an acre of fine willows varies greatly; it was estimated by R. L. and R. Cotterell of Ruscombe, Berks, as follows: trenching and cleaning ground, £12; sets, 20,000 at 5s. per 1000, £5; planting and levelling £1. Hoeing, first year, £2; succeeding years £5.25. The principal expenses, to 1837, were the roads become "tired," and should be grubbed up. The first year's crop, known as the "maiden" crop, is of small value but should be cut and the ensuing years of maturity will yield crops of about 130 lbs. green, or 100 lbs. dry. If well taken care of, many years of the rejection being two-thirds, this would produce about 44 lbs., which at £3 per load of 80 lbs., the appreciated market value of 1897, would be worth £16, 10s. The cost of whitening is 1s. 6d. per butt, but against this the value of the product sold, sold as brown, is £2 per ton, may be set off. In years of abundant crops and short demand, prices have fallen to £2 per load.

The cost of planting and the outlay for mauring and weeding during the first two years of the crop, are higher in the Midlands and the yield was estimated by Ellison at 6 to 10 tons per acre, green, worth from £3, 10s. to £6, per ton. White rods, costing from £3, to £15, 6d. per ton for extra labour, will realize from £22 to £24 per ton. Black rods, £12 to £15 per ton extra, will realize from £22 to £24 per ton. From £2 to £3 tons of green are required to produce one ton white or buff. Wm. Scanning of Notts estimated the entire cost of an osier plantation at £33, 12s. per acre, for the first five years, and £7, 5s. and £6, 15s. respectively. The maiden crop he valued at £8, 12s. and the second and third years' crop at £17, 6d. and £22. A table given by Krabe, based on results obtained for 12 plantations of Osiris Osiris, one of the principal gods of the ancient Egyptians. See Egypt, section "Egyptian Religion."

OSKALOOSA, a city and the county-seat of Mahaska county, Iowa, U.S.A., about 62 m. S.E. of Des Moines. Pop. (1900) 212, of whom 649 were foreign-born and 344 were negroes; (1910 U.S. census) 946. It is served by the Chicago, Burlington & Quincy, the Chicago, Rock Island & Pacific, and the Iowa Central railways, and by interurban electric lines. The city is built on a fertile prairie in one of the principal coal-producing regions of the state. At Oskaloosa is held the Iowa yearly meeting of the Society of Friends; and the city is the seat of Penn College (opened 1873), a Friends' institution, and of the Iowa Christian College (incorporated as Oskaloosa College in 1856 and reincorporated under its present name in 1902). At the village of University Park (incorporated in 1900), a suburb adjoining the city on the E., is the Central Holiness University (1906; coeducational), where the annual camp meeting of the National and Iowa Holiness Associations is held. Coal-mining is the most important industry in the surrounding region. There are deposits of clay and limestone in the vicinity, and among the city's manufactures are drain and sewer tile, paving and building bricks, cement blocks, and warm-air furnaces. In 1905 the factory products were valued at £20,000. Oskaloosa was first settled in 1843; it was selected in 1844 by the county commissioners as a site for the county-seat, and was chartered as a city in 1853. It is said to have been named in honour of the wife of the Indian chief Mahaska (of the Iowa tribe), in whose honour the county was named; a bronze statue of Mahaska (by Sherry E. Fry, an Iowa sculptor) was erected here in 1909.

OSMAN ('OSMAN), the usual form of the Arabic name 'Omithan, as representing the Turkish and Persian pronunciation of the name. It is used, therefore, for (1) the founder of the Osmanli or Ottoman dynasty, Osman I., who took the title of sultan, ruled in Asia Minor, and died in 1326, and (2) the sixteenth sultan Osman II., who reigned 1603-1621 (see Turkey: History). For the third Mahomedan caliph see 'Omithan and Calepate.

OSMAN (1832-1909), Turkish pasha and mushir (field marshal), was born at Tokat in Asia Minor, in 1832. Educated at the military academy at Constantinople, he entered the cavalry in 1853, and served under Omer Pasha in the Russian War of 1853-56, in Wallachia and the Crimea. Appointed a captain, in the Imperial Guard, he went through the campaigns of the Lebanon in 1860 and of Crete in 1867 to 1869, under Mustapha Pasha, when he distinguished himself at the capture of the convent of Hagia Georgia, and was promoted lieut.-colonel. He served under Redif Pasha in suppressing an insurrection in Yemen in 1871, was promoted major-general in 1874, and general of division in 1875. Appointed to command the army corps at Widin in 1876 on the declaration of war by Servia, he defeated Tcherniaieff at Saitschar and again at Yavor in July, invaded Servia and captured Alexinatz and Deligrad in October, when the war ended. Osman was promoted to be mushir, and continued in the command of the army corps at Widin. When the Russians crossed the Danube in July 1877, Osman moved his force to Plevna, and, with the assistance of his engineer, Tewzik Pasha, entrenched himself there on the right flank of the Russian line of communication, and gradually pushed Osman, being himself in command of the position. He repulsed the three general assaults of the Russians on the 20th and 30th July and the 11th September, inflicting on them great loss—some 30,000 men in the three battles. He held the position, after being closely invested, until the 9th December, when, compelled by want to cut his way out, he was severely wounded and forced to capitulate. This famous improvised defence of a position delayed the Russians for five months, and enabled their crossing the Balkan range in the depth of winter after the third battle of Plevna. The sultan conferred on Osman the Grand Cross of the Osmanie in brilliants and the title of "Ghazi" (victorious), and, when he returned from imprisonment in Russia,
OSMIUM—OSNABRUCK

made him commandant of the Imperial Guard, grand-master of the artillery and marshal of the palace. In December 1878 he became war minister, and held the post, with a small break, until 1885. He died at Constantinople, in the palace built for him by the sultan near Yildiz Kiosk, on the 14th of April 1900, and his body was buried with great pomp in the Sultan Muhammad Mosque.

OSMIUM [symbol Os., atomic weight 190-9 (O=16)], in chemistry, a metallic element, found in platinum ore in small particles, consisting essentially of an alloy of osmium and iridium known as osmiridium. It was first obtained in 1830 by Smithson Tennant (Phil. Trans., 1804, 94, p. 411). It may be prepared from osmiridium by fusing the alloy with zinc, the zinc being afterwards removed by distillation. The residue so obtained is then powdered and ignited with barium nitrate, which converts the iridium into its oxide and the osmium into barium osmate. The barium salt is extracted by water and boiled with nitric acid, when the osmium volatilizes in the form of its tetroxide. As an alternative the osmiridium is fused with zinc, the alloy treated with hydrochloric acid, and then heated with barium nitrate and water in a closed vessel (J. Chem. Soc., 1833) in the presence of a current of air, or in a current of oxygen, or on adding potassium chloride and hydrochloric acid to a solution of the tetroxide in hydrochloric acid. It crystallizes in dark red octahedra which are almost insoluble in cold water. The reduced solution contains osmium tetroxide, (OsO₄)₂, but on warming, the tetroxide has no influence on osmium, but on warming the tetroxide with a mixture of potassium iodide and hydrochloric acid a deep emerald green colour is produced, due to the formation of a compound, OsI₂H₂I; this reaction is a delicate test for osmium (Dumas, Comptes rendus, 1905, 149, p. 1254). OsMIUM DismalPh. (OsS₄), is obtained as a dark brown precipitate, insoluble in water, by passing sulphured hydrogen into a solution of an osmiridium. The tetroxide is carefully prepared when sulphured hydrogen is passed into acid solutions of the tetroxide. It is a brownish black solid, insoluble in solutions of the alkali sulphides. The atomic weight of the metal has been determined by K. Seubert (Ber., 1888, 21, p. 1839) from the analysis of potassium and ammonium osmiridium compounds, the values obtained being apparatus.

OSNABRUCK, a town and episcopal see of Germany, in the Prussian province of Hanover, situated on the Hase, 70 m. W. of the city of Hanover, 31 m. by rail N.E. of Münster, and at the junction of the lines Hamburg-Cologne and Berlin-Amsterdam. Pop. (1905) 59,580. The older streets contain many interesting examples of Gothic and Renaissance domestic architecture, while the substantial houses of the modern quarters testify to the present prosperity of the town. The old fortifications have been converted into promenades. The Roman Catholic cathedral, with its three towers, is a spacious building of the 13th century, partly in the Romanesque and partly in the Transitional style; but it is inferior in architectural interest to the Marienkirche, a fine Gothic structure of the 14th and 15th centuries. The town hall, a 15th-century Gothic building, contains portraits of some of the plenipotentiaries engaged in treating the peace of Westphalia, the negotiations for which were partly carried on here from 1644 to 1648. Other important buildings are the museum, erected in 1888-1890, and containing scientific and historical collections; the episcopal palace and the law courts. The lunatic asylum on the Gertrudenberg occupies the site of an ancient nunnery. The town has an equestrian statue of the emperor William I, a statue of Justus Möser (1720-1794) and a memorial of the war of 1870-1871. Linen was formerly the staple product, but it no longer retains that position. The manufactures include machinery, paper, chemicals, tobacco and cigars, pianos and beer. Other industries are spinning and weaving. The town has large iron and steel works and there are coal mines in the neighbourhood. A brisk trade is carried on in grain and wood, textiles, iron goods and Westphalian hams, while important cattle and horse fairs are held here.

Osnabrück is an ancient place and in 888 received the right to establish a mint, a market and a toll-house. Surrounded by a count's jurisdiction, the 11th century, it maintained an independent attitude towards its nominal ruler, the bishop, and joined the Hanseatic League, reaching the height of its prosperity in the 15th century. The decay inaugurated by the dissensions of the Reformation was accelerated by the ravages of the Thirty Years' War, but a new period of prosperity began about the middle of the 18th century. The bishopric of Osnabrück was founded by Charlemagne about 800, after he had subdued the Saxons. It embraced the district between the Ems and the Hunte, and was included in the archbishopric of Cologne. By the peace of Westphalia it was decreed that it should be held by a Roman Catholic and a Protestant bishop alternately, and this state of affairs lasted until the secularization of the see in 1803. In 1815 the bishopric was given to Hanover. The last bishop was Frederick, duke of York, a son of the English king George III. Since 1857 Osnabrück has been the seat of a Roman Catholic bishop.
OSNABURG—OSROENE

OSNABURG, the name given to a coarsish type of plain fabric, originally made from flax yarn. It is now made from either flax, tow or jute yarns—sometimes flax or tow warp with mixed or jute weft, and often entirely of jute. The finer and better qualities form a kind of common sheeting, and the various kinds may contain from 20 to 36 threads per inch and 10 to 15 picks per inch.

OSORIO, JERONYMO (1506–1580), Portuguese historian, was a native of Lisbon and son of the Ouvidor Geral of India. In 1570 his mother sent him to Salamanca to study civil law, and in 1575 he went on to Paris to study philosophy, and there became intimate with Peter Fabre, one of the founders of the Society of Jesus. Returning to Portugal, Osorio, for the sake of his Bosco, where he had been sent in a name that King John III. invited him in 1536–1537 to lecture on scripture in the reorganized university of Coimbra. He returned to Lisbon in 1540, and acted as secretary to Prince Luiz, and as tutor to his son, the prior of Crato, obtaining also two benefices in the diocese of Vizeu. In 1542 he printed in Lisbon his treatise De nobilitate. After the death of Prince Luiz in 1553, he drew from court to his churches. He was named archdeacon of Evora in 1556, and much against his will became bishop of Silves in 1564. The Cardinal Prince Henry, who had bestowed these honours, desired to employ him at Lisbon in state business when King Sebastian took up the reins of power in 1568, but Osorio excused himself on the ground of his pastoral duties, though he showed his zeal for the commonwealth by writing two letters, one in which he dissuaded the king from going to Africa, the other sent during the latter's first expedition there (1574), in which he called on him to return to his kingdom. Sebastian looked with disfavour on opponents of his African adventure, and Osorio found it prudent to leave Portugal for Paris, whence he proceeded to Rome on the pretext of a visit ad limina. His scruples regarding residence, and the appeals of the king and the Cardinal Prince, prevented him enjoying for long the hospitality of Pope Gregory XIII., and he returned to his diocese and died at Tavira on the 20th of August 1580. An exemplary prelate, a learned scholar and an able critic, Osorio gained a European reputation by writing in Latin, then the lingua franca of the studious throughout Christendom, and the perfection of his prose style caused him to be named by contemporaries "the Portuguese Cicero." His well-stocked library was carried off from Faro when the earl of Essex captured the town in 1596, and many of the books were bestowed on the Bodleian at Oxford.

His principal works written in Latin include: (1) De gloria et nobilitate civilis et christianorum, an English version of which by W. Blandine appeared in London in 1576. (2) De justitia. (3) De legis institutione et disciplina. (4) De vera sapientia. (5) De rebus Emmanuelis (1586), a history of the reign of King Emanuel, which is little more than a translation of chronicles of the period by Damilo de Coes. Osorio's book was turned into Portuguese by F. M. do Nascimento (q.v.), into French by J. Crispin (2 vols., Geneva, 1610), and an English paraphrase in 2 vols. by J. Gibbs came out in London in 1752. His Opera omnia was published in 1592. His two books of his polemical treatises have been translated into English, his Epistile ad Elizabetha Quene of England by R. Shacklock (Antwerp, 1565), and his Convocation of M. W. Hadden by J. Fen (Louvain, 1568). His Portuguese epigraphs published in his annotations, in Pliny and Dio (Cassius), which occasionally has been changed into Osroene, in assimilation to the Parthian name Ostros or Chosroes (Khosrau). The founder of the dynasty is therefore called Osroes by Procop. Belas Pers. i. 177; but Orhi or Urhi, son of Huyyi (i. *the

OSREY, or OSPRAY, a word said to be corrupted from "Ossifrage," Lat. ossifragus, bone-breaker. The Ossifraga of Pliny (H.N. x. 3) and some other classical writers seems to have been the Lämmergeray (q.v.); but the name, not inapplicable in that case, has been transferred to another bird which is no breaker of bones, save incidentally those of the fishes it devours.

The osprey is a rapacious bird, of middling size and of conspicuously-marked plumage, the white of its lower parts, and often of its head, contrasting sharply with the dark brown of the back and most of its upper parts when the bird is seen on the wing. It is the Falco haliaeetus of Linnaeus, but was, in 1810, established by J. C. Savigny (Ois. de l'Egypte, p. 35) as the type of a new genus Pandion. It is closely related to the family Falcornidae, but is the representative of a separate family, Pandionidae. Pandion differs from the Falcornidae not only pterologically, but, as C. L. Nitzsch, but also osteologically, as pointed out by A. Milne-Edwards (Ois. foss. France, ii. pp. 413, 419). In some of the characters in which it differs structurally from the Falcornidae, it agrees with certain of the owls; but the most important parts of its internal structure, as well as of its pterology, forbid a belief that there is any near alliance of the two groups. The special characters of the family are the presence of a reversible outer toe, the absence of an afterhaft and the feathering of the inner two.

The osprey is one of the most cosmopolitan birds-of-prey. From Alaska to Brazil, from Lapland to Natal, from Japan to Tasmania, and in some of the islands of the Pacific, it occurs as a winter-visiter or as a resident. Though migratory in Europe at least, it is generally independent of climate. It breeds equally on the half-thawed shores of Hudson's Bay and on the cays of Honduras, in the dense forests of Finland and on the barren rocks of the Red Sea, in Kamchatka and in West Australia. Among the countries it does not frequent are Iceland and New Zealand. Where, through abundance of food, it is numerous—as in former days was the case in the eastern part of the United States—the nests of the fish-hawk (to use its American name) may be placed on trees to the number of three hundred close together. Where food is scarcer and the species accordingly less plentiful, a single pair will occupy an isolated rock, and jealously expel all intruders of their kind, as happens in Scotland. Few birds lay eggs so beautiful or so rich in colouring: their white or pale blue is clouded with brown, or marbled with almost any shade of purple, orange and red—passing from the most delicate lilac, buff and peach-blossom, through violet, chestnut and crimson, to a nearly absolute black. The fierceness with which ospreys defend their eggs and young, in addition to the dangerous situation not infrequently chosen for the eyrie, make the task of robbing the nests difficult.

The term "osprey," applied to the nuptial plumages of the egrets in the feather esprit, is derived from the French esprit; it has nothing to do with the osprey bird, and its use has been supposed to be due to a confusion with "spray." (A. N.)

OSROENE, or OSROENE, a district of north-western Mesopotamia, in the hill country on the upper Bilecas (Belichis; mod. Naher Belîk, Bilikh), the tributary of the Euphrates, with its capital at Edessa (q.v.), founded by Seleucus I. About 130 B.C. Edessa was occupied by a nomadic Arab tribe, the Ortheoi (Plin. v. 85; v. 25, 117, 129), who founded a small state ruled by their chieftains with the title of kings. After them the district was known as Osroene. The capital was once called Osroene; this, which occasionally has been changed into Osroene, in assimilation to the Parthian name Ostros or Chosroes (Khosrau). The founder of the dynasty is therefore called Osroes by Procop. Belas Pers. i. 177; but Orhi or Urhi, son of Huyyi (i. *the

1 Another supposed old form of the name is "Orefiae"; but that is not the true form. A Rollall of Foss Inscriptions, in Pliny and Dio (Cassius), which, as is shown by Zettel's Dictionary (p. 408), "Asprey" is the oldest English form; but "Osprey" is given by Cotgrave, and is found as early as the 15th century.

2 Two good examples of the different localities chosen by this bird for its nest are illustrated in Osehca Wellyana, pls. B & H.
OSSINING, JOHN EVELYN DENISON, Viscount (1800–1873), English statesman, was the eldest son of John Denison (d. 1820) of Ossining, Nottinghamshire, where he was born on the 27th of January 1800. Educated at Eton and Christ Church, Oxford, he became member of parliament for Newcastle-under-Lyme in 1823, being returned for Hastings three years later, and holding for a short time a subordinate position in Canning's ministry. Defeated in 1830 both at Newcastle-under-Lyme and in the city of Oxford, he returned to the service in 1832 as representative of the county of Nottinghamshire in 1831; and after the great Reform Act he represented the southern division of that county from 1832 until the general election of 1837. He represented Halton from 1841 to 1857, and North Nottinghamshire from 1857 to 1872. In April 1857 Denison was chosen Speaker of the House of Commons. Re-elected at the beginning of three successive parliaments he continued in that position until February 1872, when he resigned and was created Viscount Ossining. He refused, however, to accept the pension usually given to retiring Speakers. In 1827 he had married Charlotte (d. 1889), daughter of William, 4th duke of Portland, but he left no children. He died on the 7th of March 1873, and his title became extinct.

OSSORES, also OSROEN or CHOSROES, the Greek form of the Persian name Khosrau (see CHOSROES). The form Osroes is generally used for a Parthian king who from his coins appears to have reigned from about A.D. 106–129, as successor of his brother Pacorus. But during all this time another king, Vologases II. (77–147) maintained himself in a part of the kingdom. Osroes occupied Armenia, and placed Excudarias, a son of Pacorus, and afterwards his brother Parthamasir on the throne. This encroachment on the Roman sphere led to the Parthian war of Trajan. In 147 Parthamasir surrendered to Trajan and was killed. In Mesopotamia a brother of Osroes, Meherdates (Mithradates IV.), and his son Sanatruces II. took the diadem and tried to withstand the Romans. Against them Trajan united with Parthamasar, whom he placed on the throne, when he had advanced to Ctesiphon (116). But after the death of Trajan (117) Hadrian acknowledged Osroes and made Parthamasir king of Edessa (Osroes); he also gave back to Osroes his two daughters, who had been taken prisoners by Trajan (Dio Cass. 68, 17, 22, 32; Malalas, p. 275 f.; Spartanis Vita Hdr. 5, 13; Pausan. v. 12, 6). But meanwhile Vologases II. had regained a dominant position; his coins begin again in 122 and go on to 146, whereas after 121 we have no coins of Osroes except in 128.

By Procopius, Pers. i. 17, 24, the name of the territory of Osroene is derived from a dynast Osroes, but this is a false etymology (see OSROENE).

OSSA (mod. Kissowe or Kissavo), a mountain in the district of Magnesia in Thessaly, between Pelion and Olympus, from which it is separated by the valley of Tempe. Height about 6400 ft. The Giants are said to have piled Pelon upon it in their attempt to scale Olympus.

OSSETT, a municipal borough in the Morley parliamentary division of the West Riding of Yorkshire, England, 3 m. W. of Wakefield, on the Great Northern and (Horbury and Ossett station) the Lancashire and Yorkshire railways. Pop. (1901) 12,903. It includes the contiguous townships of Ossett, South Ossett and Gawthorpe. The church of the Holy Trinity, a fine cruciform structure in the Early Decorated style, was erected in 1865. Woollen cloth mills, and extensive collieries in the neighbourhood, employ the large industrial population. There are medicinal springs similar in their properties to those of Cheltenham. The municipal borough, incorporated in 1809, is under a mayor, 4 aldermen and 12 councillors. Area 3238 acres.

OSSIAN, Ossin or Oisin, the legendary Irish 3rd-century hero of Celtic literature, son of Finn. According to the legend embodied in the Ossianic or Ossinian poems and prose romances which early spread over Ireland and Scotland, Ossian and his Fenian followers were defeated in 283 at the battle of Gallbra by the Irish king Carbery, and Ossian spent many years in fairyland, eventually being baptized by St. Patrick. As Oisin he was killed in 464. In the 13th century, when the Irish literary revival had repopularized the Fenian hero, in Scotland the Ossianic revival is associated with the name of James Macpherson (q.v.).

See CLEF: Literature; also NUTT's Ossian and the Ossianic Literature (1896).
Ireland and France, and he became an accomplished athlete and by no means an indifferent scholar. Having come to London in 1652 he was rightly suspected of sympathizing with the exiled royalists, and in 1655 was put into prison by Cromwell; after his release about a year later he went to Holland and married a Dutch lady of good family, accompanying Charles II. to England in 1660. In 1661 Butler became a member of both the English and the Irish Houses of Commons, representing Bristol in the former and Dublin University in the latter House; and in 1662 was made an Irish peer as earl of Ossory. He held several military appointments, in 1665 was made lieutenant-general of the army in Ireland, and in 1666 was created an English peer as Lord Butler; but almost as soon as he appeared in the House of Lords he was imprisoned for two days for challenging the duke of Buckingham. In 1666 a fortunate accident had allowed Ossory to take part in a big naval fight with the Dutch, and in May 1672, being now in command of a ship, he fought against the same enemies in Southwold Bay, serving with great distinction on both occasions. The earl was partly responsible for this latter struggle, as in March 1672 before war was declared he had attacked the Dutch West India fleet, an action which he is said to have greatly regretted in later life. Whilst visiting France in 1672 he rejected the liberal offers made by Louis XIV. to induce him to enter the service of France, and returning to England he added to his high reputation by his conduct during a sea-fight in August 1673. The earl was intimate with William, prince of Orange, and in 1677 he joined the allied army in the Netherlands, commanding the British section and winning great fame at the siege of Mons in 1678. He acted as deputy for his father, who was lord-lieutenant of Ireland, and in parliament he defended Ormonde's Irish administration with great vigour. In 1680 he was appointed governor of Tangier, but his death on the 30th of July 1680 prevented him from taking up his new duties. One of his most intimate friends was John Evelyn, who eulogizes him in his Diary. Ossory had eleven children, and his eldest son James became duke of Ormonde in 1688.

See T. Carte, Life of James, duke of Ormonde (1851); and J. Evelyn, Diary, edited by W. Bray (1890).

OSSORY (Ostrage), an ancient kingdom of Ireland, in the south-west of Leinster. The name is preserved by dioceses of the Church of Ireland and the Roman Catholic Church. The kingdom of Ossory was founded in the 2nd century A.D., and its kings maintained their position until 1110.

OStADE, the name of two Dutch painters whose ancestors were settled at Eyndhoven, near the village of Ostade. Early in the 17th century Jan Hendrickx, a weaver, moved from Eyndhoven to Haarlem, where he married and founded a large family. The eldest and youngest of his sons became celebrated artists.

1. Adrian Ostadé (1610-1683), the eldest of Jan Hendrickx's sons, was born and died at Haarlem. According to Houbraken he was taught by Frans Hals, at that time master of Adrian Brouwer. At twenty-six he joined a company of the civic guard at Haarlem, and at twenty-eight he married. His wife died in 1640 and he speedily re-married, but again became a widower in 1666. He took the highest honours of his profession, the presidency of the painters' guild at Haarlem, in 1662. Among the treasures of the Louvre collection, a striking picture represents the father of a large family sitting in state with his wife at his side in a handsomely furnished room, surrounded by his sons and five daughters, and a young married couple. It is an old tradition that Ostadé here painted himself and his children in holiday attire; yet the style is much too refined for the painter of boors, and Ostadé had but one daughter. The number of Ostadé's pictures is given by Smith at three hundred and eighty-five, but by Hofstede de Groot (1910) at over 900. At his death the stock of his unsold pieces was over two hundred. His engraved plates were put up to auction, with the pictures, and fifty etched plates—most of them dated 1647-1658—were disposed of in 1686. Two hundred and twenty of his pictures are in public and private collections, of which one hundred and four are signed and dated, and while seventeen are signed with the name but not with the date.

Adrian Ostadé was the contemporary of David Teniers and Adrian Brouwer. Like them he spent his life in the delineation of the homeliest subjects—tavern scenes, village fairs and country quarters. Between Teniers and Ostadé the contrast lies in the different condition of the agricultural classes of Brabant and Holland, and the atmosphere and dwellings that were peculiar to each region. Brabant has more sun, more comfort and a higher type of humanity; Teniers, in consequence, is silvery and sparkling; the people he paints are fair specimens of a well-built race. Holland, in the vicinity of Haarlem seems to have suffered much from war; the air is moist and hazy, and the people, as depicted by Ostadé, are short, ill-favoured and marked with a stamp of adversity on their features and dress. Brouwer, who painted the Dutch boor in his frolics and passion, imported more of the spirit of Frans Hals into his delineations than his colleague; but the type is the same as Ostadé's. During the first years of his career Ostadé displayed the same tendency to exaggeration and frolic as his comrade, but he is to be distinguished by his more general use of the principles of light and shade, and especially by the large extension of light on a small surface in contrast with a broad expanse of gloom. The key of his harmonies remains for a time in the scale of greys. But his treatment is dry and careful, and in this style he shuns no difficulties of detail, representing cottages inside and out, with the vine leaves covering the poorness of the outer walls, and nothing inside to deck the patchwork of rafters and thatch, or tumble-down chimneys and ladder staircases, that make up the sordid interior of the Dutch rustic of those days. The greatness of Ostadé lies in the fact that he often caught the poetic side of the life of the peasant class, in spite of its ugliness, and stunted form and misshapen features. He did so by giving their vulgar sports, their quarrels, even their quieter moods of enjoyment, the magic light of the sunbeam, and by clothing the wreck of cottages with gay vegetation.

It was natural that, with the tendency to effect which marked Ostadé from the first, he should have been fired by emulation to rival the masterpieces of Rembrandt. His early pictures are not so rare but that we can track how he glided out of one period into the other. Before the dispersion of the Geel collection at Vienna in 1872, it was easy to study the steel-grey harmonies and exaggerated caricature of his early works in the period intervening between 1647 and 1658. There is, for instance, a "Country Girl with a Tooth Drawn," in the Vienna Gallery, unsigned, and painted about 1652: a "Boggiper" of 1635 in the Liechtenstein Gallery at Vienna; cottage scenes of 1653 and 1656, in the museums of Karlsruhe and Vienna; and a small panel of 1655 in the Ossory palace at Vienna, which make up for the loss of the Geel collection. The same style marks most of those pieces. About 1658 or 1640 the influence of Rembrandt suddenly changed his sty and made him a master. He does not seem to have taken back, where the angels appearing in the sky to Dutch boors half asleep amidst their cattle, sheep and dogs, in front of a cottage, at once recall the similar subject by Rembrandt and his effective mode of lighting the principal groups by rays propelled to the earth out of a dark corner. But Ostadé was successful in the effort to vulgarize Scripture. He might have been pardoned had he given dramatic force and expression to his picture; but his shepherds were only bored without much emotion, passion or surprise. His picture was an effective representation of light, as there is nothing holy in all the charm of his brown tone relieved by strongly impasted lights, but without the very qualities which made his usual subjects attractive. When, in 1642, he painted the beautiful interior at the Louvre, in which a money-changer and his child sit in the neighbourhood of his cottage near which her husband is sitting, the darkness of a country loft is dimly illuminated by a beam from the sun that shines on the casement; and one might think the painter intended to depict the effect by exaggeration. But Ostadé had steered far from that, and the very attractive indeed except the wonderful Rembrandtian transparency, the brown tone, and the admirable keeping of the minutest parts. Ostadé was more at home in a similar effect applied to the "Slagmand" of 1654, and the two "Greek Citizens," of 1656, which are masterpieces of 1643, once in the Geel collection. In this and similar subjects of previous and succeeding years, he returned to the homely subjects in which his power and wonderful observation made him the first authority for religious and historical themes. He never did, however, use the word "Dutch," nor allow his compositions to be published with the name; this is only surpassed as regards arrangement and colour by Rembrandt's "Carpenter's Family" at the Louvre, or the
"Woodcutter and Children" in the gallery of Cassel. Innumerable almost are the more familiar themes to which he devoted his brush during this interval, from small single figures, representing smokers or drinkers, to vulgarized allegories of the five senses (Hermitage and Brunswick galleries), half-lengths of smokers and painters of the flesh, and the etchings of Rembrandt,or the various scenes of gambling, or itinerant players and quacks, and nine-pin players in the open air. The humour in some of these pieces is contagious, as in the "Tavern Scene" of the Lacaze collection (Louvre, 1635). His art may be studied in the large series of dated pieces which make up a "Landscape" of 1622, the Raesdael. But the work of the Raesdael. This work is the picture, likeness the worthy of a masterly and £1000. But it is in winter scenes that Isaac displays the best qualities. The absence of foliage, the crisp atmosphere, the calm air of cold January days, unsullied by smoke or vapour, preclude the use of the brown tint of the artist's contemporary, and but to ring the changes of the more opal tints of great variety, upon which the figures emerge with masterly effect on the light background upon which they are thrown. Amongst the road-side inns which will best repay attention we should notice the "Tavern of the Three Lions", the National Gallery, the Wallace and Holford collections in England, and those of the Louvre, Berlin, Hermitage, and Rotterdam museums and the Rothschild collection at Vienna on the Continent. The finest of the ice scenes is the famous one at the Louvre! But the picturesque "Le Freres Ostade", by Marguerite van de Wiele (Paris, 1803). For his etchings see L'Oeuvre d'Ostade, ou description des eaux-fortes de ce maître, &c., by Auguste d'Orange (1860); and Catalogue raisonné de toutes les estampes qui forment l'œuvre grand d'Adrien van Ostade, by L. H. Frere (English, 1862). OSTASHKOV, a town of Russia, in the government of Tver, on Lake Seliger, 108 m. W.N.W. of the city of Tver; pop. 10,457. The climate is damp and unhealthy. The town has tanneries, and is a centre for the making of boots and shoes, for agricultural implements, fishing-nets and the building of boats. The advantageous site, the proximity of the Smolensky Zhitnyi monastery, a pilgrim resort of the island of the lake and the early development of certain petty trades combined to bring prosperity to Ostashkov. Its cathedral (1672-1685) contains valuable offerings, as also do two other churches of the same century.

OSTEND. (Flemish and French Ostende), a town of Belgium in the province of West Flanders. Pop. (1904) 41,881. It is the most fashionable seaside resort and the second port of the kingdom. Situated on the North Sea it forms almost the central point on the 42 m. of sea-coast that belong to Belgium. In the middle ages it was strongly fortified and underwent several sieges; the most notable was that of 1601-1604, when it only surrendered by order of the states to Spinola. In 1865 the last vestiges of its ramparts were removed, and since that date, but more especially since 1898, a new town has been created. The digue or parade, constructed of solid granite, extends for over 1.5 km along the shore in a southerly direction from the long jetty which protects the entrance to the port. A fine casino and the royal château are prominent objects along the sea front, and the sea-bathing is unsurpassed. In the rear of the town is a fine park to which a race-course has been added. Extensive works were begun in 1900 for the purpose of carrying the harbour back 2 km, and a series of large docks were excavated and extensive quays constructed. The docks accommodate ships of large displacement, and there are three passenger and goods railways. More than 1500 boats per year pass through the port, including a large passenger and provision traffic with England, and is the headquarters of the Belgian fishing fleet, estimated to employ 400 boats and 1600 men and boys. Ostend is in direct railway communication with Brussels, Cologne and Berlin. It is also the starting point of several light railways along the coast and to the southern towns of Flanders.

OSTEND COMPANY. The success of the Dutch, English and French East India Companies led the merchant and shipowners of Ostend to desire to establish direct commercial relations with the Indies. A private company was accordingly formed in 1717 and some ships sent to the East. The emperor Charles VI. encouraged his subjects to raise subscriptions for the new enterprise, but did not grant a charter or letters patent. Some success attended these early efforts, but the jealousy of the neighbouring nations was shown by the seizure of an Ostend
merchantman with its rich cargo by the Dutch in 1710 off the coast of Africa, and of another by the English near Madagascar. The Ostenders, however, despite these losses, persevered in their project. The opposition of the Dutch made Charles VI hesitate for some time to grant their requests, but on the 10th of December 1722 letters patent were granted by which the company of Ostend received for the period of thirty years the privilege of trading in the East and West Indies and along the coasts of Africa on this side and on that of the Cape of Good Hope. Six directors were nominated by the emperor, and subscriptions to the company flowed in so rapidly that the shares were at the end of August 1723 at 12 to 15% premium. Two factories were established, one at Cohom on the coast of Coromandel near Madras, the other at Bankibazar on the Ganges. At the outset the prospects of the company appeared to be most encouraging, but its promoters had not reckoned with the jealousy and hostility of the Dutch and English. The Dutch appealed to the treaty of Westphalia (1648) by which the king of Spain had prohibited the inhabitants of the southern Netherlands from trading with the Spanish colonies. The transference of the southern Netherlands to Austria by the peace of Utrecht (1713) released the Dutch from this disability, but the Spanish government, however, after some hesitation concluded a treaty of commerce with Austria and recognized the company of Ostend. The reply to this was a defensive league concluded at Herrenhausen in 1725 by England, the United Provinces and Prussia. Confronted with such formidable opposition the court of Vienna judged it best to yield. By the terms of a treaty signed at Paris on the 31st of May 1727 the emperor suspended the charter of the company for seven years, and the powers in return guaranteed the Pragmatic Sanction. The company, after nominally existing for a short time in this state of suspended animation, became extinct. The Austrian Netherlands were condemned to remain excluded from maritime commerce with the Indies until their union with Holland in 1815. (G. E.)

OSTEOLGY (Gr. ἄρραση, bone), that part or branch of the science of anatomy which has for its subject the bony framework of the body (see Bone, Skeleton, Anatomy, &c.).

OSTERMANN, ANDREI IVANOVICH, COUNT (1686–1747), Russian statesman, was born at Boxhum in Westphalia, of middle-class parents, but was educated in Russia. He was the son of the merchantman Andrey Ostermann. He became secretary to Vice-Admiral Cornelius Kruse, who had a standing commission from Peter the Great to pick up promising young men, and in 1677 entered the tsar’s service. His knowledge of the principal European languages made him the right hand of Vice-Chancellor Shafirov, whom he materially assisted during the troublesome negotiations which terminated in the peace of the Truf (1711). Osterman, together with General Bruce, represented Russia at the Aland peace congress of 1718. Shrewdly guessing that Sweden was at exhaustion point, and that Görtz, the Swedish plenipotentiary, was acting utra vires, he advised Peter to put additional pressure on Sweden to force a peace. In 1721 Osterman concluded the peace of Nystad with Sweden, and was created a baron for his services. In 1723 he was made vice-president of the ministry of foreign affairs for bringing about a very advantageous commercial treaty with Persia. Peter also constantly consulted him in domestic affairs, and he introduced many administrative novelties, e.g. “the table of degrees,” and the reconstruction of the College of Foreign Affairs on more modern lines. During the reign of Catherine I. (1725–1727) Osterman’s authority still further increased. The conduct of foreign affairs was left entirely in his hands, and he held also the posts of minister of commerce and postmaster-general. On the accession of Peter II. Osterman was appointed governor to the young emperor, and on his death (1730) he refused to participate in the attempt of Demetrius Golitsin and the Dolgorukis to convert Russia into a limited constitutional monarchy. He held aloof till the emperor Anna was firmly established on the throne as autocrat. Then he got his reward. His unique knowledge of foreign affairs made him indispensable to the empress and her counsellors, and even as to home affairs his advice was almost invariably followed. It was at his suggestion that the cabinet system was introduced into Russia. All the useful reforms introduced between 1725 and 1740 are to be attributed to his initiative. He improved the state of trade, lowered taxation, encouraged industry and promoted education, ameliorated the judicature and materially raised the credit of Russia. As foreign minister he was cautious and circumspect, but when war was necessary he prosecuted it vigorously and left nothing to chance. The successful conclusions of the War of the Polish Succession (1733–1735) and of the war with Turkey (1736–39) were entirely due to his diplomacy. During the brief regency of Anna Leopoldovna (October 1740–December 1741) Osterman stood at the height of his power, and the French ambassador, La Chetardie, reported to his court that “it is not too much to say that he is tsar of all Russia.” Osterman’s foreign policy was based upon the Austrian alliance. He had, therefore, guaranteed the Pragmatic Sanction with the deliberate intention of defending it. Hence the determination of France to remove him at any cost. Russia, as the natural ally of Austria, was very obnoxious to France; indeed it was only the accident of the Russian alliance which, in 1741, seemed to stand between Maria Theresa and absolute power. But, in that year, when his brother, on rendering the Russian alliance unserviceable to the queen of Hungary was implicated in the intrigues of Russia in hostilities with her ancient rival, Sweden, and which was brought about, by French influence and French money, when in August 1741 the Swedish government, on the most frivolous pretexts, declared war against Russia. The dispositions previously made by Osterman enabled him, however, to counter the blow, and all danger from Sweden was over when, early in September, Field-Marshal Lacy routed the Swedish general Wrangel under the walls of the frontier-fortress of Villmanstrand, which was carried by assault. It now became evident to La Chetardie that only a revolution would overthrow Osterman, and this he proposed to promote by elevating to the throne the tsarevna Elizabeth, who hated the vice-chancellor because, though he owed everything to her father, he had systematically neglected her. Osterman was therefore the first and the most illustrious victim of the coup d’etat of the 6th of December 1741. Accused, among other things, of contributing to the elevation of the empress Anne by his cabals and of suppressing a supposed conspiracy against Peter III, he was sentenced to death. But, without appealing to the clemency of the young tsar, he threw himself on the mercy of the Russian monarch. He was condemned first to be broken on the wheel and then beheaded; but, reprieved on the scaffold, his sentence was commuted to lifelong banishment, with his whole family, to Berezov in Siberia, where he died six years later.

Osterman and the proposed Partition of Turkey (Russ.) (Odessa, 1886); P. F. Finch, "Diplomatic Despatches from Russia, 1739–1742" (St. Petersburg, 1893–1894) in the collections of the Russ. Hist. Soc. vol. 85 and 91; R. Nisbet Bain, The Pupils of Peter the Great (London, 1897); and The Daughter of Peter the Great (London, 1899), chapters 1–3.

OSTERODE, a town in the Prussian province of East Prussia, 75 m. by rail N.E. of Thorn, on Lake Drawenz, and at the junction of lines to Memel, Elbing and Schonsee. Pop. (1905) 13,957. It has a castle built by the Teutonic knights in 1270, and an ancient town wall. The manufactures are railway plant, machinery, beer, spirits and bricks, while it has several saw-mills. Osterode has a lively trade in cattle, grain and timber.

See J. Müller, Osterode und Ostpreussen (Osterode, 1905).

OSTERODE, a town in the Prussian province of Hanover, at the south foot of the Harz Mountains, 34 m. N.W. of Nordhausen by rail. Pop. (1905) 7,467. The church of St Agudius (Evangelical), founded in 724 and rebuilt after a fire in 1578, contains some fine tombs of the dukes of Brunswick-Grubenhagen, who made Osterode their residence from 1361 to 1452. Other buildings are the fine town-hall and the hospital. There are
manufactures of cotton and woolen goods, cigars and leather, and tanners, dyeworks and gypsum quarries. In recent years Österode has become celebrated as a health resort.

ÖSTERSUND, a town of Sweden, capital of the district (län) of Jönköping, on the east shore of Storjö (Great Lake), 364 m. N. by W. of Stockholm by rail. Pop. (1900) 6866. It lies at an elevation of 224 ft., and the town is set in the midst of a very fertile and beautiful district. Immediately facing the town is the lofty island of Frös, with which it is connected by a bridge 1148 ft. long. A ruinic stone commemorates the building of a bridge here by a Christian missionary, Austmader, son of Guidfart. Östersund was founded in 1786. It has a considerable trade in timber, and a local trade by steamers on Storjö. Electricity is obtained for lighting and other purposes by utilizing the abundant water-power in the district.

OSTERVALD, JEAN FRÉDÉRIC (1663-1747), Swiss Protestant divine, was born at Neuchâtel on the 25th of November 1663. He was educated at Zürich and at Saumur (where he graduated), studied theology at Orleans under Claude Pajon, at Paris under Jean Claude and at Geneva under Louis Tronchin, and was ordained to the ministry in his native place in 1683. As preacher, pastor, lecturer and author, he attained a position of great influence. On the 2nd of this day, he and his friends, J. A. Turreret of Genève, the Prince A. W. of Wurtemberg, and B. St. Distler (1658-1723) formed what was once called the "Swiss triumvirate." He was thought to be a leaning towards Socinianism and Arminianism. He died on the 14th of April 1747.

His principal works are Traité des sources de la corruption qu’égne aujourd’hui parmi les chrétiens (1700), translated into English, Dutch and German, practically a plea for a more ethical and less doctrinal type of Christianity; Caléchisme ou reformation dans la religion chrétienne (1702), also translated into English, Dutch and German; Traité contre l’impureté (1707); Sermons sur divers textes (1722-1724), Théologie compendium (1730); and Traduction de la Bible (1735). In his writings attained great popularity among French Protestants; many were translated into various languages; and "Osterwald’s Bible," a revision of the French translation, in particular, was long well known and much valued in Britain.

OSTIA, an ancient town and harbour of Latium, Italy, at the mouth of the river Tiber on its left bank. It lies 14 m. S.W. from Rome by the Via Ostiensis, a road of very ancient origin still followed by a modern road which preserves some traces of the old pavement and remains of several ancient bridges. It was the first colony ever founded by Rome—according to the Romans themselves, by Ancus Martius—and took its name from its position at the mouth (ostium) of the river. Its origin is connected with the establishment of the salt-maries (salinae—see Salare, Via) which only ceased to exist in 1875, though it acquired importance as a harbour in very early times. When it began to have magistrates of its own is not known: nor indeed have we any inscriptions from Ostia that can be certainly attributed to the Republican period. Under the empire, on the other hand, it had the ordinary magistrates of a colony, the chief being duoviri, charged with the administration of justice, whose place was taken every fifth year by duoviri cento et duodecim quaestores, then quaestores (or financial officials) and then aediles (building officials). There were also the usual decuriones (town councillors) and Augustales. We learn much as to these magistrates from the number of inscriptions that have been found (over 2000 in Ostia and Portus taken together) and also as to the cults. Vulcan was the most important—perhaps in early times the only—deity worshipped at Ostia, and the priesthood of Vulcan was held sometimes by Roman senators. The Diocletian too, as patrons of mariners, were held in honour. Later we find the worship of Isis and of Cybele, the latter being especially flourishing, with large corporations of denarephori (priests who carried branches of trees in procession) and canophori (basket-carriers); the worship of Mithras, too, had a large number of followers. There was a temple of Serapis at Portus. No traces of Jewish worship have been found at Ostia, but at Portus a considerable number of Jewish inscriptions in Greek have come to light.

Of the church in Ostia there is no authentic record before the 4th century A.D., though there are several Christian inscriptions of an earlier date; but the first bishop of Ostia of whom we have any certain knowledge dates from A.D. 313. The see still continues, and is indeed held by the dean of the sacred college of cardinals. A large number of the inscriptions are also connected with the various guilds (sirenen (centonarii), carpenters and metal workers (falso), boatmen, lightermen and others (see J. P. Walzing, Les Corporations professionnelles, Bruxelles and Liége).

Until Trajan formed the port of Centumcellae (Civitavecchia) Ostia was the best harbour along the low sandy coast of central Italy between Monte Argentario and Monte Circeo. It is mentioned in 354 B.C. as a trading port, and became important as a naval harbour during the Punic Wars. Its commerce increased with the growth of Rome, and this, and the decay of agriculture in Italy, which obliged the capital to rely almost entirely on imported corn (the importation of which was, from 267 B.C. onwards, under the charge of a special quaestor stationed at Ostia), rendered the possession of Ostia the key to the situation on more than one occasion (87 B.C., A.D. 409 and 337). The inhabitants of the colony were thus regarded as a permanent garrison, and at first freed from the obligations of ordinary military service, until they were later on obliged to serve in the fleet. Thus Ostia was an ideal naval harbour: the mouth of the Tiber is exposed to the southwest wind, which often did damage in the harbour itself; in A.D. 62 no less than 200 ships with their cargoes were sunk, and there was an important guild of divers (urinatores) at Ostia. The difficulties of the harbour were increased by the continued silting up, produced by the enormous amount of solid material brought down by the river. Even in Strabo’s time (v. 3. 5. p. 231) the harbour of Ostia had become dangerous: he speaks of it as a “city without a harbour owing to the silting up brought about by the Tiber . . . : the ships anchor at considerable risk in the roads, but the love of gain prevails: for the large number of lighters which receive the cargoes and reload them renders the time short before they can enter the river, and having lightened a part of their cargoes they sail in and ascend to Rome.”

Floods had projected remedial measures, but (as in so many cases) had never been able to carry them out, and it was not until the time of Claudius that the problem was approached. That emperor constructed a large new harbour on the right bank, 23 m. N. of Ostia, with an area of 170 acres enclosed by two curving moles, with an artificial island, supporting a lofty lighthouse, in the centre of the space between them. This was connected with the Tiber by an artificial channel, and by this work Claudius, according to the inscriptions which he erected in A.D. 46, freed the city of Rome from the danger of inundation. The harbour was named by Nero, Portus Augusti.

Trajan found himself obliged in A.D. 103, owing to the silting up of the Claudian harbour, and the increase of trade, to construct another port further inland—a hexagonal basin enclosing an area of 97 acres with enormous warehouses—communicating with the harbour of Claudius and with the Tiber by means of the channel already constructed by Claudius, this channel being prolonged so as to join the new port and sea. The port was blocked in the middle ages, but was reopened by Paul V. in 1612, and is still in use. Indeed it forms the right arm of the Tiber, by which navigation is carried on at the present day, and is known as the Fossa Trajana. The island between the two arms acquired the name of Insula Sacra (still called Isola Sacra) by which Procopius mentions it.

Ostia thus lost a considerable amount of its trade, but its importance still continued to be great. The 2nd and 3rd centuries, indeed, are the high-water mark of its prosperity: and it still possessed a mint in the 4th century A.D. During the Gothic wars, however, trade was confined to Portus, and the ravages of pirates led to its gradual abandonment. Gregory IV. constructed in 890 a fortified enceinte, called Gregoriopolis, in the eastern portion of the ancient city, and the Saracens were signaly defeated here under Leo IV. (847-856). The battle is represented in Giulio Romano’s fresco from Raphael’s design in the Stanza dell’ Incendio in the Vatican.
In the middle ages Ostia regained something of its importance, owing to the siting up of the right arm of the Tiber. In 1483-1486 Giuliano della Rovere (nephew of Pope Sixtus IV.), and afterwards himself Pope Julius II.) caused the castle to be erected by Baccio Pontelli, a little to the east of the ancient city. It is built of brick and is one of the finest specimens of Renaissance fortification, and exemplifies especially the transition from the old girdle walls to the system of bastions; it still has round corner towers, not polygonal bastions (Burckhardt). Under the shelter of the castle lies the modern village. The small cathedral of St. Aurea, also an early Renaissance structure, with Gothic windows, is by some ascribed to Meo del Caprina (1430-1501). Hitherto Ostia does not seem to have been very unhealthy. In 1557, however, a great flood caused the Tiber to change its course, so that it no longer flowed under the walls of the castle, but some half a mile farther west; and its old bed (Fiume Morto) has ever since then served as a breeding ground for the malarial mosquito (Anopheles claviger). An agricultural colony, founded at Ostia after 1575, and consisting mainly of cultivators from the neighbourhood of Ravenna, has produced a great change for the better in the condition of the place. The modern village is a part of the commune of Rome. The marshes have been drained, and a pumping station erected. The Castel Tramway has been constructed from Rome to Ostia and thence to the seashore, now some 2 m. distant, where sea-bathing is carried on.

Excavations on the site of Ostia were only begun towards the close of the 18th century, and no systematic work was done until 1834, when under Pius IX. a considerable amount was done (the objects are now in the Lateran museum). The Italian government, to whom the greater part of it now belongs, has many of the more important buildings in 1880-1883; but much was left undone. Owing to the fact that the site is largely covered with sand and to the absence of any later alterations, the preservation of the buildings excavated is very good, and Ostia is, with the exception of Pompei, the best example in Italy of a town of the Roman period. On the east side of the town is approached by an ancient road, flanked by tombs. On the right (N.) are some small well-preserved thermae, and the barracks of the Servian (vigiles), a special cohort of whom was stationed here. On one side of the central courtyard of the latter building is a chapel with inscribed pedestals for imperial statues (2nd and 3rd century A.D.) and a well-preserved black and white pavement, perhaps a sacrifice (see J. Carcopino in Mémoire de l’Ecole Francaise, 1906).

To the south-west is the Forum, an area 265 ft. square surrounded by colonnades, in which were placed the offices of the various collegia or guilds of boatmen, raftmen, and others, which had a special importance at Ostia; the names of the guilds may still be read in inscriptions in the mosaic pavements of the chambers. In the centre of the area are the substructions of a temple, and on the south-east side are the remains of the theatre, built in the early imperial period, restored by Septimius Severus in 196-197 and again in the 4th or 5th century. To the south-west of the Forum are the remains of three small temples, one dedicated to Venus, and a well-preserved Mithreum, with mosaics representing the seven planets, &c. To the south-west again is the conspicuous brick cella of a lofty temple, on arched substructions, generally supposed to be that of Vulcan, with a threshold block of africano (Euboean) marble over 15 ft. long: from it a street over 20 ft. wide leads north-west to the river. It is flanked on each side by well-preserved warehouses, another group of which, surrounding a large court, lies to the south-west. The brick and on arches which flank the northern half of the walls is especially fine. Hence an ancient road, leading between warehouses (into which the Tiber is encroaching), in one room of which a number of well-preserved large jars may be embedded in the floor, runs close to the river to a large private house with thermae, in which five mosaics were found: it (groundlessly) bears the name of "imperial palace." Farther to the south-west are remains of other warehouses, and possibly of the docks—long narrow chambers, which may have served to contain ships. Here are remains of (earlier) structures in opus quadratum whereas the great bulk of the ruins are in brickwork and belong to the imperial period. The medieval Turne Boacciana marks approximately the mouth of the Tiber in Roman times.

The south-eastern portion of the city has been excavated only very partially. To the south-west of the conspicuous temple alluded to are the remains of a temple of Cybele, with a portico. This lay close to the commencement of the Via Severiana (see Severiana, Via), and the line of tombs which flanked it soon begins. Farther south-east, a line of sand dunes, covering the ruins of ancient villas, marks the coastline of the Roman period. Some 2 m. to the south-east is the pine forest of Castel Fussano, taking its name from a castle erected by the marchese Sacchetti in the 16th century. It is now the property of the Chigi and is leased to the king (see Laurentina, Via). Here Drs Lowe and Sambon made the decisive experiments which proved that the propagation of malaria was due to the mosquito Anopheles claviger. See Notitia degli scavi, passim: H. Dessau in Corp. Inscrip. Lat. Secr. (Berlin, 1887), pp. 1 sqq., and the works of T. As.OSTIACKS, or Ostiaks, a tribe who inhabit the basin of the Ob in western Siberia belonging to the Finno-Ugric group and related to the Voguls. The so-called Ostiaks of the Venisei speak an entirely different language. The best investigators (Castren, Lerbeg, A. Schrenck) consider the trans-Uralian Ostiaks and Samoyeds as identical with the Yurta of the Russian annals. During the Russian conquest their abodes extended much farther south than now, forty-one of their fortified places having been destroyed by the Cossacks in 1501, in the region of Obdorsk alone. Remains of these "towns" are still to be seen at the Kunovat river, on the Ob 20 m. below Obdorsk and elsewhere. The total number of the Ostiaks may be estimated at 27,000. Those on the Irtish are mostly settled, and have adopted the manner of life of Russians and Tatars. Those on the Ob are mostly nomads; along with 8000 Samoyeds in the districts of Berezov and Surfut, they own large herds of reindeer. The Ob Ostiaks are russified to a great extent. They have a most extensive trading, borrowing from Russian merchants corn for bread, the use of which has become widespread.

The Ostiaks call themselves As-yakh (people of the Ob), and it is supposed that their present designation is a corruption of this name. By language they belong (Castren, Reiseberichte, Reisenbriefe: Ailqvist, Uforsa af Piskia Vet. Soc. Forh. Xxii.) to the Ugrian branch of the Finno-Ugric stocks, and speak the same language, mixed to some extent with foreign elements; but three or four leading dialects can be distinguished.

The Ostiaks are middle-sized, or of low stature, mostly meagre, and not ill made, however clumsy their appearance in winter in their thick-furred clothing. The extremities of the meagre little feet are usually small. The skull is brachycephalic, mostly of moderate size and height. The hair is dark and soft for the most part, fair and reddish individuals being rare; the eyes are dark, generally narrow; the nose is flat and broad; the mouth is large with thick lips; the beard is scanty. The Mongolian type is more strongly pronounced in the women than in the men. On the whole, the Ostiaks are not a pure race; the purest type is found among the young women.

The Ostiaks are fond of clothing, their dress consisting of skins and革 made mixed with Samoyeds. They describe them as kind, gentle and honest; rioting is almost unknown among them, as also theft, this last occurring only in the vicinity of Russian settlements, and the only penalty enforced being the restitution twofold of the property stolen.

They are very skillful in the arts they practice, especially in carving wood and bone, tanning (with egg-yolk and brains), preparation of implements from birch-bark, &c. Some of their carved or decorated bark implements (called Ufers) are figured in Middendorff's "Sibirische Reise, iv. 2" show considerable artistic skill.

Their folk-lore, like that of other Finnish stems, is imbued with a feeling of national poetry, and reflects also the sadness, or even the despair, of the Finnish spirit. They have made some progress among them and St Nicholas is a popular saint, but their ancient pagan observances are still retained.

For the language see Ailqvist, "Über die Sprache der Nord-Ostjaknen" (80) and "Von der am wenigsten Finnischen Sibirischen Ougrieven," particularly papers by Sirelius and Karjalainen, and the papers by Munkacsi, Gennep, Fuchs and others in the Revue orientale für die études Ourals-Altaïques; Patkanov, Die Irtsh-Ostaken und ihre Volkspoesie (Petersburg, 1900); Patkanov, Irtsh-Ostaken, und ihre Volkspoesie (1907-1909); Papay, Irtsh-Ostaken, und ihre Volkspoesie (1906).
OSTRA, an ancient town of Umbria, Italy, near the modern Montenovo, S.E. of Sena Gallica (Sinigaglia). It is hardly mentioned by ancient authors, but excavations have brought to light remains of various buildings and some inscriptions exist. Pliny mentions it another ancient town, Suasa, 5 m. W. which also did not survive the classical period.

**OSTRACISM**, a political device instituted, probably by Cleisthenes in 508 B.C., as a constitutional safeguard for the Athenian democracy. Its effect was to remove from Athens for a period of ten years any person who threatened the harmony and tranquillity of the body politic. A similar device existed at various times in Argos, Miletus, Syracuse and Megara, but in these cities it appears to have been introduced under Athenian influence. In Athens in the sixth prytany of each year the representatives of the Boule asked the Ecclesia whether it was for the welfare of the state that ostracism should take place. If the answer was in the affirmative, a day was fixed for the voting in the eighth prytany. No names were mentioned, but it is clear that two or three names at the most could have been under consideration. The people met, not as usual in the Pryx, but in the Agora, in the presence of the Archons, and recorded their votes by placing in urns small fragments of pottery (which in the ancient world served the purpose of waste-paper) (ostraca) on which they wrote the name of the person whom they wished to banish. As in the case of other privilegia, ostracism did not take effect unless six thousand votes in all were recorded. Grote and others hold that six thousand had to be given against one person before he was ostracized, but it seems unlikely that the attendance at the Ecclesia ever admitted of so large a vote against one man, and the view is contradicted by Plut. Arist. c. 7. The ostracized person was compelled to leave Athens for ten years, but he was not regarded as a traitor or criminal. When he returned, he resumed possession of his property and his civic status was unimpaired. The adverse vote simply implied that his power was so great as to be injurious to the state. Ostracism must have been of importance in determining the form in which democracy was developed in the Parthenon, which involved loss of property and status, and was for an indefinite period (i.e. generally for life). Certain writers have even spoken of the "honour" of ostracism. At the same time it was strictly unjust to the victim, and a heavy punishment to a cultured citizen for whom Athens contained all that made life worth living. Its political importance really was that it transferred the protection of the constitution from the Areopagus to the Ecclesia. Its place was afterwards taken by the Graphi Paranomôn.

There is no doubt that Cleisthenes' object was primarily to get rid of the Peisistratid faction without perpetual recourse to armed resistance (so Androtion, Ath. Pol. 22, Ephorus, Theopompos, Aristotle, Pol. iii. 13, 1284 a 17 and 36; viii. (v.), 3, 1302 b 15). Aristotle's Constitution of Athens (c. 22) gives a list of ostracized persons, the first of whom was a certain Hipparchus of the Peisistratid family (488 B.C.). It is an extraordinary fact that the device was introduced in 508 B.C. for the purpose of expelling Hipparchus it was not till twenty years later that he was condemned. This has led some critics (see Lugchil in Das Wesen ... der Ostrakismos, who arrives at the conclusion that ostracism could not have been introduced till after 406 B.C.) to suspect the unanimous evidence of antiquity that Cleisthenes was the inventor of ostracism. The problem is difficult, and no satisfactory answer has been given. Aelian's story that Cleisthenes himself was the first to be ostracized is attractive in view of his overtures to Persia (see CLEISTHENES), but it has little historical value and conflicts with the chapter in Aristotle's Constitution—which, however, may conceivably be simply the list of those recalled from ostracism at the time of Xerxes' Invasion, all of whom must have been ostracized less than ten years before 481 (i.e. since Marathon). With the end of the Persian Wars, the original object of ostracism was removed, but continued in use for forty years and was revived in 417 B.C. It now became a mere party weapon and the farcical result of its use in 417 in the case of Hyperbolus led to its abolition either at once, or, as Luebke seeks to prove, in the archonship of Euclides (403 B.C.). Such a device inevitably lent itself to abuse (see Aristotle, Pol. 38, 1284 b 22 εστασιατικος χρωτος).

Grote maintains that ostracism was a useful device, on the grounds that it removed the danger of tyranny, and was better than the perpetual civil strife of the previous century. The second reason is strictly beside the point, and the first has no force after the Persian Wars. As a factor in party politics it was both unnecessary and injurious to the state. Thus in the Persian Wars, it deprived Athens of the wisdom of Xanthippus and Aristides, while at the battle of Tanagra and perhaps at the time of the Egyptian expedition the assistance of Cimon was lacking. Further, it was a blow to the fair-play of party politics; the defeated party, having no leader, was reduced to desperate measures, such as the assassination of Ephialtes. To defend it on the ground that it created and stimulated the national consciousness is hardly reconcilable with the historic remark of the voter who voted against Aristides because he wished to hear no more of his incorruptible integrity; moreover in democratic Athens the "national consciousness" was, if anything, too frequently stimulated in the ordinary course of government. Aristotle, admitting its usefulness, rightly describes ostracism as in theory tyrannical; Montesquieu (Esprit des lois, xii. cc. 19, 20, &c.) defends it as a mild and reasonable institution. On the whole, the history of its effect in Athens, Argos, Miletus, Megara and Syracuse (where it was called Petalismos), furnishes no sufficient defence against its admitted disadvantages. The following is a list of persons who suffered ostracism:—Hipparchus (488); Megacles (487), Xanthippus (485), Aristides (483), Themistocles (471); Cimon (467?) Thucydides, son of Melesias (444), Damon, Hyperbolus (417) and possibly Cleisthenes himself (q.v.).

**AUTHORITIES.—**For the procedure in O. see Appendix Ptolemy (Pseon, p. 675); see also, besides authorities quoted above, Busolt, i. 620; Müller's Handbuch, iv. 1, 121; Gilbert, Gr. St. i. 446-466 and Greek Constitutional Antiquities (Eng. trans., 1895); A. H. J. Greenidge, Handbook of Greek Constitutional Antiquities (1896), histories of Greece in general. The view maintained in the text as to the number of votes necessary is supported by Duruy (H. of G. ii. 1, 36), Boeckh, Wachsmuth, &c.; opposed by Grote, Oman and (on the whole) by Evelyn Abbott. On the danger of privilegia in general see Green, de Legibus, iii. 4, and note that in Athens, ostracism gratuitously anticipated a crime which, if committed, would have been punishable in the popular Heliaea. Cf. also article Exile.

America. They are so named (Gr. shell-skins or shell-bearers) in allusion to the nacreous shell-like appearance of the inner face of the plates of armour which cover the more common paired fins. They must also have been provided with the usual gill-apparatus, but there is reason to believe that their lower jaw was not on the fish plan. They are, therefore, at least as low in the zoological scale as the existing lampreys, with which Cope, Smith, Woodward and others have associated them. They are all small animals, many of them only a few centimetres in length.

The oldest and lowest family of Ostracoderm, that of Coelolepididae, is known by nearly complete skeletons of Thelodus (fig. 1) and Lanaria from the Upper Silurian mudstones of Lanarkshire, Scotland. The body is completely and uniformly covered with minute granules which resemble the scales of sharks, and were erroneously ascribed to sharks when they were first discovered in the Upper Silurian bone-bed at Ludlow, Shropshire. The head and anterior part of the trunk are depressed and shown from above or below in the fossils, and this region sharply contracts behind into the slender tail, which is generally seen in side view, with one small dorsal fin and a forked heterocercal tail. The eyes are far forward and wide apart. In another family, that of the Cephalaspidae (fig. 2), the animals resemble the Coelolepids in shape, but their skin-granules are fused into small plates, which are polygonal where there must have been much flexibility, and in rings round the tail where the underlying successive plates of muscle necessitated this arrangement. The eyes are close together. At the opening of the gill-cavity on each side at the back of the head, there is a flexible flap which is sometimes interpreted as a pectoral fin. Part of the armour of the Cephalaspids contains bone-cells, but the dermal plates of two other families, the Pteraspidae (fig. 3) and Drepanaspidae, consist merely of fused shagreen granules without any advance towards bone. The Pteraspidae are interesting as being on the inner side of the dorsal shield impressions which suggest that the gill-cavities extended unusually far forwards to the front of the head. Another family, known only by nearly complete skeletons from the Upper Silurian mudstones of Lanarkshire, is the Birkeniidae, comprising small fusiform species which are covered with granules disposed in curiously-arranged rows. The highest Ostracoderm are the Asterolepidae, which occur only in Devonian rocks and include the familiar Pterichthys (fig. 4) from the Middle Old Red Sandstone of Scotland. In this family the primitive skin-tubes seem to have fused, not into polygonal plates, but along the lines of the slime-canals. The Asterolepum armor consists of symmetrically arranged, overlapping plates on the back and round the body, with a pair of flippers similarly armored and appended to the latter. The tail resembles that of other Ostracoderm and is sometimes covered with scales.

OSTRAU, the name of two Austrian towns in the Ostrau-Karwin coal-mining district. (1) Mährisch-Ostrau (Moravian Ostrau), a town in Moravia, 95 m. N.E. of Brno by rail. Pop. (1900) 30,125. It is situated on the right bank of the Ostrawitz, near its confluence with the Oder, and it derives its importance from the neighbourhood of coal mines, and the blast furnaces and iron-works which they have called into existence. The manufactures comprise sheet-iron, boilers, zinc, brick and tiles, paraffin, petroleum, soap and candles. The Rothchild iron-works at Wiwititz are in the vicinity. (2) Polnisch-Ostrau (Polish Ostrau), a mining town in Austrian Silesia, opposite Mährisch-Ostrau. Pop. (1900) 18,761, mostly Czech. It has large coal mines, which form the south-western portion of the extensive Upper Silesian coal fields, the largest Austrian deposit.

OSTRICH (O. Eng. estridge; Fr. autruche; Sp. avestruz; Lat. avis struthio; Gr. στύρθος εταίρος δέκα στήριξιν): the Struthio camelus of Linnaeus, and the largest of living birds, an adult male standing nearly 8 ft. high and weighing 300 lb. The genus Struthio forms the type of the group of Ratite birds, characterized chiefly by large size, breast-bone without a keel, strong running legs, rudimentary wings and simple feathers (see Brd). The most obvious distinctive character presented by the ostrich is the presence of two toes only, the third and fourth, on each foot—a character absolutely peculiar to the genus Struthio. In South America another large Ratite bird, the rhea, is called ostrich; it can be distinguished at once from the true ostrich by its possession of three toes.

From British Museum, Catalogue of Fossil Fishes; by permission of the Trustees.

Fig. 3.—Pleraspis rostrata, from the Lower Old Red Sandstone of Herefordshire, restored by Dr A. S. Woodward; about one-third nat. size.

From the Mem. Palaeont. Soc.

Fig. 4.—Plerichthys milleri, from the Middle Old Red Sandstone of Scotland, restored by Dr R. H. Traquair; upper (A), lower (B), and left-side view (C), about one-half nat. size.
The wild ostrich is disappearing before the persecution of man, and there are many districts, some of wide extent, frequented by the ostrich in the 19th century—especially towards the extremities of its African range—in which it no longer occurs, while in Asia there is evidence, more or less trustworthy, of its former existence in most parts of the south-western deserttracts, in few of which it is now to be found. Xenophon’s notice of its abundance in Assyria (Anabasis, i. 5) is well known. It is probable that it still lingers in the wastes of Kirwan in eastern Persia, whence examples may occasionally stray northward to those of Turkestan, even near the Lower Oxus; but the assertion, often repeated, as to its former occurrence in Baluchistan or Sind seems to rest on testimony too slender for acceptance. Apparently the most northerly limit of the ostrich’s ordinary range at the present day is that portion of the Syrian Desert lying directly eastward of Damascus; and, within the limits of what may be called Palestine, H. B. Tristram (Fauna and Flora of Palestine, p. 140) regards it as but a straggler from central Arabia, though we have little information as to its distribution in that country.

Africa is still, as in ancient days, the continent in which the ostrich chiefly flourishes. There it appears to inhabit every waste so sufficiently extensive to afford it the solitude it loves. Yet even there it has to contend with the many species of carnivora which prey upon its eggs and young—the latter especially; and H. Lichtenstein long ago remarked that it was not for its numerous enemies “the multiplication of ostriches would be quite unexampled.”

Though sometimes assembling in troops of from thirty to fifty, and occasionally as one or two solitary specimens in the latter antelopes, ostriches commonly, and especially in the breeding season, live in companies of not more than four or five, which is a cock and the rest are hens. The latter lay their eggs in one and the same nest, a shallow pit scraped out by their feet, with the earth heaped around to form a kind of wall against which the outermost circle of eggs rest. As soon as ten or a dozen eggs are laid, the cock begins to brood, always taking his place on them at nightfall surrounded by the hens, while, by day, when the sun’s rays would make their way to the nest it would seem to guard their common treasure from jackals and small beasts of prey than directly to forward the process of hatching, for that is often left wholly to the sun. Some thirty eggs are laid in the nest, and round it are scattered perhaps as many more. Of the oldest ones said to be broken by the old birds to serve as nourishment for the newly-hatched chicks, whose stomachs cannot bear the hard food on which their parents thrive. The greatest care is taken to place the nest where it may not be discovered, and the birds avoid being seen when going to or from it, while they display great solicitude for their young. C. J. Andersen in his Lake Ngami (pp. 253-260) has given a lively account of the pursuit by himself and Francis Galton of a brood of ostriches, in the course of which the male bird feigned being wounded to distract their attention from his offspring. Though the ostrich ordinarily inhabits the most arid districts, it requires water to drink; more than that, it will frequently bathe, and sometimes even, according to Von Heuglin, in the sea.

The question whether to recognize more than one species of ostrich has been continually discussed without leading to a satisfactory solution. While eggs from North Africa present a perfectly smooth surface, those from South Africa are more rough; northern birds have the skin of the parts not covered with feathers flesh-coloured, while this skin is bluish in southern birds, and hence the latter have been thought to need specific designation as S. australis. Examples from the Somicki country have been described as forming a distinct species under the name of S. motleyophanes from the leaden colour of their naked parts.

The great mercantile value of ostrich-feathers, and the increasing difficulty, due to the causes already mentioned, of procuring from wild birds, has led to the formation in Cape Colony, Egypt, the French Riviera and elsewhere of numerous “ostrich-farms,” on which these birds are kept in confinement, and at regular intervals deprived of their plumes. In favourable localities and with judicious management these establishments yield very considerable profit (see Feather).

See, besides the works mentioned, E. D’Alton, Die Skelet der Stenopari (Wap. 1852); B. I. Solater, “On the Struthious Birds living in the Zoological Society’s Menagerie,” Transactions, iv. p. 353, containing a fine representation (pl. 67), by J. Wolf, of the male Struthio camelus; J. Forest, L’Anatre (Paris, 1894); A. Douglas, Ostrich Farming in South Africa (London, 1881); modern anatomical work on the group is referred to in the article BIRDS.

OSTROG, a town of Russia, in the government of Volhynia, 95 m. W. of Zhitomir, at the confluence of the Vilva with the Gryn. Pop. (1897) 14,530. It is an épiscopal see of the Orthodox Greek Church, and in the 16th century had a classical academy, converted later into a Jesuit college. Here was made and printed in 1581 the first translation of the Bible into old Slav. In the town is a brotherhood of Cyril and Methodius, which maintains schools of its own. The tanning of light leather is an active domestic trade; other industries are potteries, oil-works, soap, candle and tobacco factories. After being plundered by the Cossack chieftain Khmelintschi in 1648, and conquered by the Russians seven years later, the town fell into decay.

OSTROGOTHS, or EAST GOTHS, one of the two main branches into which the Goths were divided, the other being the Visigoths, or West Goths. See GOTH.

OSTROVSKIY, ALEXANDER NIKOLAIVICH (1823-1886), Russian dramatic author, was born on the 12th of April 1823 in Moscow, where his father was an official of the senate. He studied
OSTUNI—OSUNA

law in the university of that city, which he quitted without having submitted to the final examination. He was then employed as a clerk in the office of the “Court of Conciseness,” and subsequently in that of the Commercial Court at Moscow. Both tribunals were called upon to settle disputes chiefly among the Russian merchant class, from which Ostrovsky was thus enabled to draw the chief characters for his earliest comedies. Among these are Byednya Nivesta (“The Poor Bride”), Byednost ne Porok (“Poverty not a Vice”), and Ne v'svoi sani ne sadis (literally “Don't put yourself in another's sledge,” meaning “Don't put yourself in a position for which you are not suited”). Of this last Nicholas I. said, “It was not a play, but a lesson.” The uncultured, self-satisfied Moscow merchants are strikingly portrayed in Grozd (“The Tempest”) and Svoyi lyudi sochityomysa (“Between near relatives no accounts are needed”), which was originally called “The Bankrupt.”

The last-mentioned comedy was prohibited for ten years, until the accession of Alexander II., and Ostrovsky was dismissed the government service and placed under the supervision of the police. The Liberal tendencies of the new reign, however, soon brought relief. Ostrovsky was one of several well-known literary men who were sent into the provinces to report on the condition of the people. Ostrovsky's field of inquiry lay along the upper Volga, a part of the country memorable for some of the most important events in Russian history. This mission induced him to write several historical dramas of great merit, such as Kuoma Zakharich Minin Soukhoroouk (the full name of the famous butcher who saved Moscow from the Poles); “The False Demetrius” and “Vassily Shuisky”; Vasilista Metelieva (the name of a favourite court lady of Ivan the Terrible), and the comedy, Voitova celi Son na Voige (“The Military Commander,” or “A Dream on the Volga”). Many of his later works treat of the Russian nobility, and include Byeeshan Dergii (literally “Mad Mozyey”), Vospol'enniki (“A Dream brought up in a Stranger’s Life”), and Varki i Oseti (“Wolf and Sheen”): others relate to the world of actors, such as Liess (“Forest”), Bez vini vinovatiya (“Guiltlessly guilty”), and Talenti e Pokloniki (“Talents and their Admirers”). Ostrovsky enjoyed the patronage of Alexander III., and received a pension of 3000 roubles a year. With the help of Moscow capitalists he established in that city a model theatre and school of dramatic art, of which he became the first director. He also founded the Society of Russian Dramatic Art and Opera Composers. His death took place on the 24th of June 1886, while travelling to his estate in Kostroma.

OSTUNI, a picturesque walled city of Apulia, Italy, in the province of Lecce, 23 m. by rail N.W. of Brindisi. Pop. (1901) 7734 (town); 22,811 (commune). It has a cathedral of the 13th century with a fine Romanesque façade, and a municipal library with a collection of antiquities. The see has been amalgamated with that of Brindisi.

OSUNA, Pedro Tellez Giron, 3rd duke of (1575–1624), Spanish viceroy of Sicily and Naples, was born at Osuna, and baptized on the 18th of January 1575. He was the son of Juan Tellez Giron, the 2nd duke, and of his wife Ana Maria de Velasco, a daughter of the constable of Castile. When he was accompanied by his grandfather, the 1st duke, to Naples, where he was viceroy. He saw service at the age of fourteen with the troops sent by Philip II. to put down a revolt in Aragon, and was married while still young to Doña Catarina Enriquez de Ribera, a grand-daughter on her mother's side of Hernan Cortes, the conqueror of Mexico. In 1598 he inherited the dukedom. Before and after his marriage he was known for the reckless dissipation of his life. The scandals to which his excesses gave rise led to his imprisonment at Arévalo in 1600. This sharp lesson had a wholesome effect on the duke, and in the same year he left Flanders, with a body of soldiers raised at his own expense. His appearance in Flanders as a grandee with a following of his own caused some embarrassment to the king's officers. But Osuna displayed unexpected doddity and good sense in the field. He was content to serve as a subordinate, and took a full share of work and fighting both on land and sea. When peace was made with England in 1604 he is said to have visited London. He is said also to have paid a visit to Holland during the armistice arranged to allow of the negotiations for the twelve years' truce of 1600; but, as he was back in Spain by that year, he cannot have seen much of the country. His services had purged his early offences, and he had been decorated with the Golden Fleece. On the 18th of September 1610 he was named viceroy of Sicily, and he took possession of his post at Melazzo on the 9th of March 1611. In 1616 he was promoted to the viceroyalty of Naples, and held the office till he was recalled on the 28th of March 1620. The internal government of Osuna in both provinces was vigorous and just. During his Sicilian viceroyalty he organized a good squadron of galleys with which he freed the coast for a time from the raids of the Mahommedan pirates of the Barbary States and the Levant. After his transfer to Naples Osuna continued his energetic wars with the pirates, but he became concerned in some of the most obscure political intrigues of the time. He entered into a policy of unmeasured hostility to Venice, which he openly attacked in the Adriatic. The princes of the Spanish branch of the Habsburgs were at all times anxious to secure safe communication with the German possessions of their family. Hence their anxiety to dominate all northern Italy and secure possession of the Alpine passes. It would have suited them very well if they could have reduced Venice to the same state of servitude as Genoa. Osuna threw himself into this policy with a whole heart. There can be no reasonable doubt that he was engaged with the Spanish ambassador, and the viceroy of Milan, in the mysterious conspiracy against Venice in 1618. As usual, the Spanish government had mismanaged its resources, and was compelled to draw back. It then found extreme difficulty in controlling its fiery viceroy. Osuna continued to act against Venice in an almost piratical fashion, and treated orders from home with scant respect. Serious fears began to be entertained that this government would not in time be able to hold the state; and Castile itself was already in a critical condition. Osuna had he tried he could have brought about a revolt which the enfeebled Spanish government could hardly have suppressed. It is, however, unlikely that he had treasonable intentions. He allowed his naval forces to be gradually reduced by drafts, and when superseded returned obediently to Madrid. After his return he was imprisoned on a long string of charges, and largely at the instigation of the Venetians. No judgment was issued against him, as he died in prison on the 24th of September 1624.

The “great duke of Osuna,” as he is always called by the Spaniards, impressed the imagination of his countrymen profoundly as a vigorous, domineering and patriotic leader of the stamp of the 16th century, and he was no less admired by the Italians. His ability was infinitely superior to that of the ordinary politicians and courtiers of the time, but he was more energetic than really wise, and he was an intolerable subordinate to the bureaucratic despotism of Madrid.

The Villa de Don Pedro Giron, duca d’Osuna, viere di Napoli e di Sicilia di Gregorio Leci (Amsterdam, 1669) is full of irrelevances, and contains much gossip, as well as speeches which are manifestly the invention of the author. But it is founded on good documents, and Leti, an Italian who detested the Spanish rule, knew the state of the country well. See also Don C. Fernandez Duru, El Gran Duque de Osuna y su Marina (Madrid, 1885), and Documentos inéditos para la historia de España (Madrid, 1842, &c.), vols. xlvii–xlviii.

OSUNA, a town of southern Spain, in the province of Sevilla; 57 m. by rail E.S.E. of Sevilla. Pop. (1900) 18,072. Osuna is built on a hill, overlooking the fertile plain watered by the Salado, a sub-tributary of the Guadalquivir. On the top of the hill stands the collegiate church, dating from 1534 and containing interesting Spanish and early German paintings. These, however, as well as the sculptures over the portal, suffered considerably during the occupation of the place by the French under Soult. The vaults, with the arches, the Spanish arches, contain the tombs of the Giron family, by one of whom, Don Juan Tellez, the church was founded in 1534. The university of Osuna, founded also by him in 1549, was suppressed in 1826; but its large building is still used as a secondary school.
The industries are agriculture and the making of esparto mats, pottery, bricks, oil, soap, cloth, linen and hats.

Osuna, the Unso of Hintius, famous in the 1st century B.C. for his long resistance to the troops of Caesar, and his fidelity to the Pompeians, was subsequently called by the Romans Osuna and Gemina Urbanorum, the last name being due, it is said, to the presence of two urban legions here. Osuna was taken from the Moors in 1239, and given to Alphonso X. to the knights of Calatrava in 1254. Don Pedro Giron appropriated it to himself in 1445. One of his descendants, Don Pedro Telliez, was the first holder of the title duke of Osuna, conferred on him by Philip II. in 1562.

Estepa (pop. 8,591), a town 6 m. N.E.E. is the Iberian and Carthaginian Astepa or Ostipo, famous for its siege in 207 B.C. by the Romans under Publius Cornelius Scipio. When further resistance became impossible, the people of Astepa set fire to their town, and all perished in the flames.

Oswald (Ø, 605-642), king of Northumbria, was one of the sons of Ethelfrith and was expelled from Northumbria on the accession of Edwin, though he himself was a son of Edwin's sister, Jezra. It appears to have spent some of his exile in Iona, where he was instructed in the principles of Christianity. In 634 he defeated and slew the British king Ceawlini at a place called by Bede Dessebisse, near Hefenfelth, which has been identified with St. Oswald's Cocklaw near Chollerford, Northumberland. By this he avenged his brother Eanfrith, who had succeeded Edwin in Bernicia, and became king of Northumbria. Oswald reunited Deira and Bernicia, and soon raised his kingdom to a position equal to that which it had occupied in the time of Edwin, with whom he is classed by Bede as one of the seven great Anglo-Saxon kings. His close alliance with the Catholic church is the characteristic feature of his reign. In 635 he sent to the elder of the Scots for a bishop. On the arrival of Aidan in answer to this request he assigned to him the island of Lindisfarne as his see, near the royal city of Bamborough. He also completed the minster of St Peter at York which had been begun by Paulinus under Edwin. Bede declares that Oswald ruled over "all the peoples and provinces of Britain, which includes four languages, those of the Britons, Picts, Scots and Angles." His relationship to Edwin may have helped him to consolidate Deira and Bernicia. Early in his reign he was sponsor to the West Saxon king Cynegils, whose daughter he married. In 642 he was defeated and slain at a place called Maserfeld, probably Oswestry in Shropshire, by Penda of Mercia.

OSWALD (992), archbishop of York, was a nephew of Oda, archbishop of Canterbury, and at an early age became, by purchase, head of the Old Minster at Winchester. Desiring to become a monk, he went with Oda's approval to the monastery of Fleury on the Loire—at that time the great centre of reviving Benedictinism. Here he soon distinguished himself by the monastic austerity of his life. In 959 he returned to England at the request of Oda, who, however, died before his arrival. He now went to York to his kinsman the Archbishop Oskytel, who took him with him on a pilgrimage to Rome. Soon after his return he was appointed bishop of Worcester at the recommendation of Dunstan, his predecessor in the see (961). As bishop he took a prominent part in that revival of monastic discipline on Benedictine lines of which Aethelwold, bishop of Winchester, was the most ardent leader. His methods, however, were less violent than those of Aethelwold. Among other religious houses he founded that of Ramsey in conjunction with Aethelwine, Ealdorman of East Anglia. In 972 he was translated (again at Dunstan's recommendation) to the archbishopric of York, with which he continued to hold the see of Worcester. He died on the 29th of February 992 and was buried at Worcester.

See Memorials of St Dunstan, edited by W. Stubbs, Rolls series (London, 1874).

OSWALDWISTLE, an urban district in the Accrington parliamentary division of Lancashire, England, on the Leeds and Liverpool Canal, 34 m. E.S.E. of Blackburn. Pop. (1901) 14,192. It possesses cotton-mills, printworks, bleachworks and chemical works, and in the neighbourhood are collieries, stone quarries and potteries. At Penfold, in the township, was born (1750) Sir Robert Peel, first baronet, who, as a factory-owner, effected wide developments in the cotton industry.

OSWEGO, a city, port of entry, and the county-seat of Oswego county, New York, U.S.A., on the S.E. shore of Lake Ontario, at the mouth of the Oswego river, about 15 m. N.W. of Syracuse. Pop. (1900) 22,199, of whom 3989 were foreign born; (1910 census) 23,368. It is served by the New York Central & Hudson River, the Delaware, Lackawanna & Western, and the New York, Ontario & Western railways, by several lines of lake steamboats, and by the Oswego Canal, which connects Lake Ontario with the Erie Canal at Syracuse. There is an inner harbour of 935 acres and an outer harbour of 140 acres, which are defended by Fort Ontario. The city lies at an altitude of 300 ft., and is divided into two parts by the Oswego river. Oswego is the seat of a Normal and Training School (founded as the City School Training School in 1861, and a state school since 1867), a state armory, and a United States life-saving station; among the public buildings are the City Library (about 14,000 volumes in 1900), founded by Gerrit Smith in 1855, the Federal Building and Custom House, the City Hall, the City Hospital, the County Court House, an Orphan Asylum, and a business college. The Oswego river has here a fall of 34 ft. and furnishes excellent water power. Among the principal manufactures are starch (the city has one of the largest starch factories in the world), knit goods, railway car springs, shade-cloth, boilers and engines, wooden-ware, matches, paper-cutting machines, and eau de cologne. The factory products were valued in 1905 at $7,592,125. Oswego has a considerable trade with Canada; in 1906 its exports were valued at $2,880,533 and its imports at $996,094. Lake commerce with other American Great Lake ports is also of some importance, the principal articles of trade being lumber, grain and coal.

The site of Oswego was visited by Samuel de Champlain in 1616. Subsequently it was a station for the Jesuit missionaries and the coureurs des bois. In 1722 a regular trading post was established here by English traders, and in 1777 Governor William Burnet of New York erected the first: Fort Oswego (sometimes called Fort Burnet, Chouaguen or Pepperrell). It was an important base of operations during King George's War and the French and Indian War. In the years 1755-1756 the British erected two new forts at the mouth of the river, Fort Oswego (an enlargement of the earlier fort) on the east and Fort Ontario on the west. In August 1756 Montcalm, marching rapidly from Ticonderoga with a force of 3000 French and Indians, appeared before the forts, then garrisoned by 1000 British and colonial troops, and on the 14th of August forced the abandonment of Fort Ontario. On the following day he stormed and captured Fort Oswego, and, dismantling both, returned to Ticonderoga. The British restored Fort Ontario in 1759. Oswego maintained a garrison here until 1904, when other posts on the lakes, they were, in accordance with the terms of the Treaty, made over to the United States. It was here in 1766 that Pontiac formally made to Sir William Johnson his acknowledgment of Great Britain's authority. On the 6th of May 1814 Sir James Yeo, with a superior force of British and Canadians, captured the fort, but soon afterwards withdrew. In 1839 the fort was rebuilt and occupied by United States troops; it was abandoned in 1899, but, after having been reconstructed, was again garrisoned in 1905. The modern city may be said to date from 1796. Oswego became the county-seat in 1816, was incorporated as a village in 1828 (when the Oswego Canal was completed), and was first chartered as a city in 1845.

See Churchill, Smith and Child, Landmarks of Oswego County (Syracuse, 1895).

* OSWESTRY, a market town and municipal borough in the Oswestry parliamentary division of Shropshire, England, on
the borders of Wales, 18 m. N.W. from Shrewsbury. Pop. (1901) 9579. It is on a branch from the Chester line of the Great Western Railway, and on the Cambrian main line. The situation is pleasant and the neighbouring district well wooded and hilly. The church of St Oswald, originally conventual, is Early English and Decorated, but has been greatly altered by restoration. There is a Roman Catholic chapel with presbytery, convent and school. The grammar school, founded in the reign of Henry IV., occupies modern buildings. The municipal buildings (1893) include a library, and a school of science and art. On a hill W. of the town are the castle grounds, laid out in 1890, but of the castle itself only slight remains are seen. The Cambrian railway engine and carriage works are here; and there are tanneries, melting works, machinery works and iron foundries. Frequent agricultural fairs are held. The town is governed by a mayor, 6 aldermen and 18 councillors. Area, 1857 acres.

Old Oswestry, also called Old Fort (Welsh Hen Dinias), is a British earthwork about a mile from the modern town. There are various unsatisfactory accounts of the early history of Oswestry (Blaneminstir, or Album Monasterium), as that was called Tre'r Cadair by the Britons and Oswell after Cuneldla Wledig, prince of North Wales, had granted it to his son Oswel. It derives its present name from Oswald, king of Northumbria, who is said to have been killed here in 642, although it was not definitely known as Oswestry until the 13th century. In the Domesday Survey it is included in the manor of Maelsea, which Rainald, sheriff of Shropshire, held of Roger, earl of Shrewsbury; but Rainald or his predecessor Warin had already raised a fortification at Oswestry called Lowere. The manor passed in the reign of Henry I. to Alan Fitz-Flaad, in whose family it continued until the death of Henry Fitzalan, earl of Arundel, without male issue in 1560. The first charter, of which a copy only is preserved among the corporation records, is one given in 1262 by John Fitzalan granting the burgesses self-government. Richard II. by a charter dated 1398 granted all the privileges which belonged to Shrewsbury, and a similar charter was obtained from Thomas, earl of Arundel in 1467. The town was incorporated by Elizabeth in 1582 under the government of two bailiffs and a common council of 24 burgesses, and her charter was confirmed by James I. in 1616. A charter granted by Charles II. in 1672 appointed a mayor, 12 aldermen and 15 common councillors, and remained the governing charter until the Municipal Corporations Act of 1835 changed the corporation. In 1288 John Fitzalan obtained the right of holding a market every week on Monday instead of Thursday. The market rights were held by the lord of the manor until 1819, when Earl Powis sold them to the corporation. In the 15th and 16th centuries a weekly market was held at Oswestry for the sale of woollen goods manufactured in North Wales, but in the 17th century the drapers of Shrewsbury determined to get the trade into their own town, and although an Order in the Privy Council was passed to restrain it to Oswestry they agreed in 1621 to buy no more cloth there. The town was walled by the time of Edward I., but was several times burnt during Welsh invasions. In 1642 it was captured for Charles I., but two years later surrendered to the parliamentary forces.

See William Cathrall, The History of Oswestry (1855); William Price, The History of Oswestry from the Earliest Period (1815); Victoria County History, Shropshire.

Oswio—Otho

Oswio (c. 612–670), king of Northumbria, son of Æthelfrith and brother of Oswald, whom he succeeded in Bernicia in 624 after the battle of Maserfeld, was one of the seventh of great English kings enumerated by Bede. He succeeded in making the majority of the Britons, Picts and Scots tributary to him. At Gilling in 651 he caused the murder of Oswine, a relative of Edwin, who had become king of Deira, and a few years later took possession of that kingdom. He appears to have consolidated his power by the aid of the Church and by a series of judicious matrimonial alliances. It was probably in 642 that he married Eanfled, daughter of Edwin, thus uniting the two rival dynasties of Northumbria. His daughter Alhild he married to Peada, son of Penda, king of Mercia, while another daughter, Osthryth, became the wife of Æthelred, third son of the same king. Oswio was chiefly responsible for the re-convocation of the East Saxons. He is said to have invited the king Sigebert of the truth of Christianity by his arguments, and at his request sent Cedda, a brother of Ceadda, on a mission to Essex. In 655 he was attacked by Penda, and, after an unsuccessful attempt to buy him off, defeated and slew the Mercian king at the battle of the Winwaed. He then took possession of part of Mercia, giving the rest to Peada. As a thank-offering he dedicated his daughter Ælffled to the Church, and founded the monastery of Whitby. About this time he is thought by many to have obtained some footing in the kingdoms of the Picts in succession to their king Tálorcán, the son of his brother Eanfrid. In 660 he married his son Ecgfrith to Æthelthryth, daughter of the East Anglian king Anna. In 664 at the synod of Whitby, Oswio accepted the usages of the Roman Church, which led to the departure of Colman and the appointment of Wilfrid as bishop of York. Oswio died in 670 and was succeeded by his son Ecgfrith.

Otho (c. 574–656), in full OTMANN IBN 'AFFÂN, the third of the Mahomedan caliphs, a kinsman and son-in-law of Mahomet and cousin of Abu Sofân, whose son Moawiyah became the first of the Omeyyad dynasty. He was elected caliph in succession to Omar in 644, but owing to his alternating weakness and cruelty and his preference of the Koreish for all responsible positions irrespective of their capacity, he produced strife throughout the empire which culminated in his assassination by Mahommed, son of Abu Bekr. He was succeeded by Ali (g.v.). See Calphate, A. § 3.

Othinel, in the Bible, a clan settled at Debir or Kirjathsepher in S. Palestine (Judg. i. 12 sqq., Josh. xvi. 15 sqq., comp. Josh. x. 38 sqq.), described as the "brother" of Caleb. The name appears in Judg. iii. 7–11 (see Judges), as that of a hero who delivered Israel from a North Syrian king. That a king from the Euphrates who had subjugated Canaan should have been defeated by a clan of the south of Palestine has been doubted. There is no evidence of such a situation, and it has been conjectured that Cushan-Rishathaim (the name suggests "C. of double wickedness") of Aram (cpw) has arisen from some king (cp. Husham, Gen. xxxvi. 34) or clan (cp. Cush, Num. xii. 1; Cushan, Hab. iii. 7) of Edom (cpw) to the south or south-east of Palestine. Othinel recurs in 1 Chron. iv. 13.

Otho, Marcus Salvius (32–69), Roman emperor from the 15th of January to the 15th of April A.D. 69, was born on the 38th of April A.D. 32. He belonged to an ancient and noble Etruscan family settled at Ferentum in Etruria. He appears first as one of the most reckless and extravagant of the young nobles who surrounded Nero. But his friendship with Nero was brought to an abrupt close in 68, when Otho refused to divorce his beautiful wife Poppea Sabina at the bidding of Nero, who at once appointed him praetor and governor of the province of Lusitania. Here Otho remained ten years, and his administration was marked by a moderation unusual at the time. When in 68 his neighbour Galba, the governor of Hispania Tarraconensis, rose in revolt against Nero, Otho accompanied him to Rome. Resentment at the treatment he had received from Nero may have impelled him to this course, but to this motive was added before long that of personal ambition. Galba was far advanced in years, and Otho, encouraged by the predictions of astrologers, aspired to succeed him. But in January 69 his hopes were dissipated by Galba’s formal adoption of L. Calpurnius Piso as the fittest man to succeed him. Nothing remained for Otho but to strike a bold blow. Desperate as was the state of his finances, thanks to his previous extravagance, he found money to purchase the services of some three-and-twenty soldiers of the praetorian guard. On the morning of January 15, five days only after the adoption of Piso, Otho attended as usual to pay his respects to
the emperor, and then hastily excusing himself on the score of private business hurried from the Palatine to meet his companions. By the time he was escorted to the praetorium camp, where, after a few moments of surprise and indecision, he was saluted emperor. With an imposing force he returned to the Forum, and at the foot of the Capitol encountered Galba, who, alarmed by vague rumours of treachery, was making his way through a dense crowd of wondering citizens towards the barracks of the guard. The cohort on duty at the Palatine, which had accompanied the emperor, instantly deserted him; Galba, Piso and others were brutally murdered by the praetorians. The brief struggle over, Otho returned in triumph to the camp, and on the same day was duly invested by the senators with the name of Augustus, the tribunician power and the other dignities belonging to the principate. Otho had owed his success, not only to the resentment felt by the praetorian guards at Galba's well-meant attempts to curtail their privileges in the interests of discipline, but also largely to the attachment felt in Rome for the memory of Nero; and his first acts as emperor showed that he was not unmindful of the fact. He accepted, or appeared to accept, the cognomen of Nero conferred upon him by the shouts of the populace, whom his comparative youth and the effeminacy of his appearance reminded of their lost favourite. Nero's statues were again set up, his freedmen and household officers reinstalled, and the intended completion of the Golden House announced. At the same time the fears of the more sober and respectable citizens were allayed by Otho's liberal professions of his intention to govern equitably, and by his judicious clemency towards Marius Celsus, consul-designate, a devoted adherent of Galba.

But any further development of Otho's policy was checked by the news which reached Rome shortly after his accession, that the army in Germany had declared for Vitellius, the commander of the legions on the lower Rhine, and was already advancing upon Italy. After vain attempts to conciliate Vitellius by the offer of a share in the empire, Otho, with unexpected vigour, prepared to go to war. From the remotest provinces which had been abandoned to him in his accession, little help was to be expected; but the legions of Dalmatia, Pannonia and Moesia were eager in his cause, the praetorian cohorts were in themselves a formidable force and an efficient fleet gave him the mastery of the Italian seas. The fleet was at once dispatched to secure Liguria, and on the 14th of March Otho, undismayed by omens and prophecies, started northwards at the head of his troops in the hopes of preventing the entry of the Vitellian troops into Italy. But for this he was too late, and all that could be done was to throw troops into Placentia and hold the line of the Po. Otho's advanced guard successfully defended Placentia against Alienus Caccina, and compelled that general to fall back on Cremona. But the arrival of Fabius Valens altered the aspect of affairs. The Vitellian commanders now resolved to bring on a decisive battle, and their designs were assisted by the divided and irresolute counsels which prevailed in Otho's camp. The more experienced officers urged the importance of avoiding a battle until at least the legions of Dalmatia had arrived. But the rashness of the emperor's brother Titianus and of Proculus, prefect of the praetorian guards, added to Otho's feverish impatience, overruled all opposition, and an immediate advance was decided upon. Otho himself remaining behind with a considerable reserve force at Brixellum, on the southern bank of the Po. When this decision was taken the Othonian forces had already crossed the Po and were encamped at Bedriacum (or Brixellum), a small village on the Via Postumia, and on the route by which the legions from Dalmatia would naturally arrive. Leaving a strong detachment to hold the camp at Bedriacum, the Othonian forces advanced along the Via Postumia in the direction of Cremona. At a short distance from that city they unexpectedly encountered the Vitellian troops. The Otholians, though taken at a disadvantage, fought desperately, but were finally forced to fall back in disorder upon their camp at Bedriacum. Thither on the next day the victorious Vitellians followed them, but only to come to terms at once with their disheartened enemy, and to be welcomed into the camp as friends. More unexpected still was the effect produced at Brixellum by the news of the battle. Otho was still in command of a formidable force—the Dalmatian legions had already reached Aquileia; and the spirit of his soldiers and their officers was unbroken. But he was resolved to accept the verdict of the battle which his own impatience had hastened. In a dignified speech he bade farewell to those about him, and then retiring to rest slept soundly for some hours. Early in the morning he stabbed himself to the heart with a dagger which he had concealed under his pillow, and died as his attendants entered the tent. His funeral was celebrated at once, as he had wished, and not a few of his soldiers followed their master's example by killing themselves at his pyre. A plain tomb was erected in his honour at Brixellum, with the simple inscription "Dii Manibus Marci Othonis." At the time of his death (the 15th of April 69) he was in his thirty-eighth year, and had reigned just three months. In all his life nothing became him so well as his manner of leaving it; but the fortitude he then showed, even if it was not merely the courage of despair, cannot blind us to the fact that he was little better than a reckless and vicious spendthrift, who was not the less dangerous because his passions were concealed beneath an affectation of effeminate dandyism. (H. F. P.)

OTIS, HARRISON GRAY (1765-1848), American politician, was born in Boston, Massachusetts, on the 8th of October 1765. He was a nephew of James Otis, and the son of Samuel Alline Otis (1740-1814), who was a member of the Confederation Congress in 1787-1788 and secretary of the United States Senate from its first session in 1789 until his death. Young Otis graduated from Harvard College in 1783, was admitted to the Bar in 1787, and soon became a Federalist in politics. He served in the Massachusetts House of Representatives in 1796-1799, in the National House of Representatives in 1799-1801, as district-attorney for Massachusetts in 1801, as speaker of the state House of Representatives in 1803-1805, as a member of the state Senate from 1805 to 1811, and as president of that body in 1805-1806 and 1808-1811, as a member of the United States Senate from 1817 to 1822, and as mayor of Boston in 1820-1832. He was strongly opposed to the War of 1812, and was a leader in the movement culminating in the Hartford Convention, which he defended in a series of open letters published in 1824, and in his inaugural address as mayor of Boston. A man of refinement and education, a member of an influential family, a popular social leader and an eloquent speaker—at the age of twenty-three he was chosen by the town authorities of Boston to deliver the Independence Day oration—Otis yet lacked conspicuous ability as a statesman. He died in Boston, on the 28th of October 1848.

OTIS, JAMES (1725-1783), American patriot, was born at West Barnstable, Massachusetts, on the 5th of February 1725. He was the eldest son of James Otis (1702-1778), fourth in descent from John Otis (1581-1657), a native of Barnstable, Devon, and one of the first settlers (in 1635) of Hingham, Mass. The elder James Otis was elected to the provincial General Court in 1758, was its speaker in 1760-1762, and was chief justice of the Court of Common Pleas from 1764 until 1776; he was a prominent patriot in the colony of Massachusetts. The son graduated at Harvard in 1743; and after studying law in the office of Jeremiah Gridley (1702-1767), a well-known lawyer with Whig sympathies, rose to great distinction at the bar, practising first at Plymouth and after 1750 at Boston. In 1760 he published Rudiments of Latin Prosody, a book of authority in its time. He wrote a similar treatise upon Greek prosody; but this was never published, because, as he said, there was not a font of Greek letters in the country, nor, if there were, a printer who could have set them up. Soon after the accession of George III. to the throne of England in 1760, the British government
decided upon a rigid enforcement of the navigation acts, which had long been disregarded by the colonists and had been almost wholly evaded during the French and Indian War. The Writs of Assize came in to roost and were about to expire, and it was decided to issue new ones, which would empower custom house officers to search any house for smuggled goods, though neither the house nor the goods had to be specifically mentioned in the writs. Much opposition was aroused in Massachusetts, the legality of the writs was questioned, and the Superior Court consented to hear argument. Otis held the office of advocate-general at the time, and it was his duty to appear on behalf of the government. He refused, resigned his office, and appeared for the people against the issue of the writs, Gridley appearing on the opposite side. The case was argued in the Old Town House of Boston in February 1761, and the chief speech was made by Otis. His plea was served in its eloquence and fervor in its assertion of the rights of the colonists. Going beyond the question at issue, he dealt with the more fundamental question of the relation between the English in America and the home government, and argued that even if authorized by act of parliament such writs were null and void. The young orator was elected in May of the same year to represent the city in the Massachusetts General Court. To that position he was re-elected nearly every year of the remaining active years of his life, serving there with his father. In 1766 he was chosen Speaker of the House of Representatives, but the choice was negatived. In September 1762 the younger Otis published A Vindication of the Conduct of the House of Representatives of the Province of Massachusetts Bay, in defense of the action of that body in sending to the governor a message (drafted by Otis) rebuking him for asking the assembly to pay for ships he had (with authorization of the Council and not of the representatives) sent to protect New England fisheries against French privateers; according to this message "it would be of little consequence to the people whether they were subject to George or Louis, the king of Great Britain or the French king, if both were as arbitrary as both would be if both could levy taxes without parliament." He also wrote various state papers addressed to the colonies to enlist them in the common cause or sent to the government in England to uphold the rights or set forth the grievances of the colonists. His influence at home in controlling and directing the movement of events which led to the War of Independence was universally felt and acknowledged; and abroad American was so frequently quoted, denounced, or applauded in parliament and the English press before 1769 as the recognized head and chief of the rebellious spirit of the New England colonists. In 1765 Massachusetts sent him as one of her representatives to the Stamp Act Congress at New York, which had been called by a Committee of the Massachusetts General Court, of which he was a member; and here he was a conspicuous figure, serving on the committee which prepared the address sent by that body to the British House of Commons. In 1769 he denounced in the Boston Gazette certain customs commissioners who had charged him with treason. Thereupon he became involved in an altercation in a public-house with Robinson, one of the commissioners; the altercation grew into an affray, and Otis received a sword cut on the head, which is considered to have caused his subsequent insanity. Robinson was acquitted, but in view of his having made a written apology, Otis declined to take this sum from him. From 1769 almost continuously until his death Otis was hopelessly insane, though he had occasional lucid intervals, serving as a volunteer in the battle of Bunker Hill in 1775 and arguing a case in 1778. He was killed by lightning (it is said that he had often expressed a wish that he might die in this way) at Andover, Mass., on the 23rd of May 1783.

Otis's political writings were chiefly controversial and exercised an enormous influence, his pamphlets being among the most effective presentations of the arguments of the colonists against the arbitrary measures of the British ministry. His more important pamphlets were A Vindication of the Conduct of the House of Representatives of the Province of Massachusetts Bay (1762); The Rights of the British Colonies Asserted and Proved (1764); A Vindication of the British Colonies against the Aspersions of the Halifax Gentleman in his Letter to a Rhode Island Friend—a letter known at the time as the "Halifax Libel" (1765); and Considerations on Behalf of the Colonists in a Letter to a Noble Lord (1765).

The best biography is that by William Tudor (Boston, 1865); there is a shorter one by Francis Boylston (Boston, 1847). The best account of Otis's characteristics and influence as a writer may be found in M. C. Tyler's Literary History of the American Revolution (New York, 1897). See also the notes on the Writs of Assistance by Horace J. Innes in Quarterly Contributions to American History, 1957-1972 (Boston, 1865). Otis's speech on the writs, reprinted from rough notes taken by John Adams, appears in Appendix A of vol. ii. of C. F. Adams's edition of the Works of John Adams (Boston, 1850).

**OTLEY—OTTAKAR**

OTLEY, a market town in the Otley parliamentary division of the West Riding of Yorkshire, England, 13 m. N.W. of Leeds on the Midland and the North-Eastern railways. Pop. of urban district (1901) 9230. It is picturesquely situated on the south bank of the Wharfe, at the foot of the precipitous Chevin Hill, 923 ft. in height. In this neighbourhood excellent building-stone is quarried, which was used for the foundations of the Houses of Parliament in London, and is despatched to all parts of England. The church of All Saints has Norman portions, and a cross and other remains of pre-Norman date were discovered in restoring the building. There are interesting monuments of members of the Fairfax family and others. Worsted spinning and weaving, tanning and leather-dressing, paper-making and the making of printing-machines are the principal industries. The scenery of Wharfedale is very pleasant. In the dale, 7 m. below Otley, are the fine ruins of Harewood Castle, of the 14th century. The neighbouring church contains a noteworthy series of monuments of the 15th century in alabaster.

**OTRANTO**, a seaport and archiepiscopal see of Apulia, Italy, in the province of Lecce, from which it is 293 m. S.E. by rail, 40 ft. above sea-level. Pop. (1901) 2295. It is beautifully situated on the east coast of the peninsula of the ancient Calabria (q.v.). The castle was erected by Alphonso of Aragon; the cathedral, consecrated in 1088, has a rose window and side portal of 1481. The interior, a basilica with nave and two aisles, contains columns said to come from a temple of Apollo and a fine mosaic pavement of 1166, with interesting representations of the months, Old Testament subjects, &c. It has a crypt supported by forty-two marble columns. The church of S. Pietro has Byzantine frescoes. Two submarine cables start from Otranto, one for Valona, the other for Corfu. The harbour is small and has little trade.

Ottorino occupies the site of the ancient Hydrus or Hydruntum, a town of Greek origin. In Roman times it was less important than Brundusium as a point of embarkation for the East, though the distance to Apollonia was less than from Brundusium. It remained in the hands of the Byzantine emperors until it was taken by Robert Guiscard in 1068. In 1480 it was utterly destroyed by the Turkish fleet, and has never since recovered its importance. About 30 m. S.E. lies the monastery of S. Maria di Leuca (so called since ancient times from its white cliffs), the S.E. extremity of Italy, the ancient Promontorium Iapigium or Salentum. The district between this monastery and a portion of theilly in Apulia is Pdf Reports (1731-1750).

**OTTAKAR I.** (d. 1236), king of Bohemia, was a younger son of King Vladislav II. (d. 1174) and a member of the Premyslid family, hence it is often referred to as Premysl Ottakar I. His early years were passed amid the anarchy which prevailed everywhere in his native land; after several struggles, in which he took part, he was recognized as ruler of Bohemia by the emperor Henry VI. in 1192. He was, however, soon overthrown, but renewing the fight in 1196 he forced his brother, King Vladislaus III., to abandon Bohemia to him and to content himself with Moravia. Although confirmed in the possession of his kingdom by the German king, Philip, duke of Swabia, Ottakar soon deserted Philip, who thereupon declared him deposed. He then joined the rival German king, Otto of Brunswick, afterwards the emperor Otto IV., being recognized as king of Bohemia both by Otto and by his ally, Pope Innocent III. Philip's consequent invasion of Bohemia was a great success. Ottakar, having been compelled to pay a fine, again ranged himself among Philip's partisans and still later was
among the supporters of the young king, Frederick II. He united Moravia with Bohemia in 1222, and when he died in 1230 he left to his son, Wenceslaus I., a kingdom united and comparatively peaceable.

Ottakar II., or Premysl Ottakar II. (c. 1230-1278), king of Bohemia, was a son of King Wenceslaus I., and through his mother, Kunigunde, was related to the Hohenstaufen rulers, being a grandson of the German king, Philip, duke of Swabia. During his father's lifetime he ruled Moravia, but when in 1248 some discontented Bohemian nobles acknowledged him as their sovereign, trouble arose between him and his father, and for a short time Ottakar was imprisoned. However, in 1251 the young prince secured his election as duke of Austria, where he strengthened his position by marrying Margaret (d. 1267), sister of Duke Frederick II., the last of the Babenbergs, of the duchy and widow of the German king, Henry VII. Some years later he repudiated this lady and married a Hungarian princess. Both before and after he became king of Bohemia in succession to his father in September 1253 Ottakar was involved in a dispute with Bela IV., king of Hungary, over the possession of Styria, which duchy had been united with Austria. By an arrangement made in 1254 he surrendered part of it to Bela, but when the dispute was renewed he defeated the Hungarians in July 1260 and secured the whole of Styria for himself, owing his formal investiture with Austria and Styria to the German king, Richard, earl of Cornwall. The Bohemian king also led two expeditions against the Prussians. In 1260 he inherited Carinthia and part of Carniolia; and having made good his claim, contested by the Hungarians, on the field of battle, he was the most powerful prince in Germany when an election for the German throne took place in 1273. But Ottakar was not the successful candidate. He refused to acknowledge his victorious rival, Rudolph of Habsburg, and urged the pope to adopt a similar attitude, while the new king claimed the Austrian duchies. Matters reached a climax in 1276. Placing Ottakar under the ban of the empire, Rudolph besieged Vienna and compelled Ottakar in November 1276 to sign a treaty by which he gave up Austria and the neighbouring duchies, retaining for himself only Bohemia and Moravia. Two years later the Bohemian king tried to recover his lost lands; he found allies and collected a large army, but he was defeated by Rudolph and killed at Dürrenkrut on the March on the 26th of August 1278. Ottakar was a founder of towns and a friend of law and order, while he assisted trade and welcomed German immigrants. Clever, strong and handsome, he is a famous figure both in history and in legend, and is the subject of a tragedy by F. Grillparzer, König Ottokars Glück und Ende. His son and successor was Wenceslaus II.

See O. Lorenz, Geschichtliche König Ottobars, ii. (Vienna, 1866); A. Huber, Geschichtliche Oesterreichs, Band i. (Gotha, 1885); and F. Falckner, Geschichte von Böhmen, Band i. (Prague, 1844).

OTTAVA RIMA, a stanza of eight iambic lines, containing three rhymes, invariably arranged as follows:—a b a b c c. It is the Italian imitation of the French ottava rima, and its use in the poetry of the fourteenth century. Boccaccio employed it for the Teseide, which he wrote at Florence in 1340, and for the Filastroto, which he wrote at Naples some seven years later. These remarkable epics gave ottava rima its classic character. In the succeeding century it was employed by Politian, and by Boiardo for his famous Orlando Innamorato (1486). It was Pulci, however, in the Morgante Maggiore (1487), who invented the peculiar mock-heroic, or rather half-serious, half-burlesque, style with which ottava rima has been most commonly identified ever since and in connexion with which it was introduced into England by Frere and Byron. The measure, which was now recognized as the normal one for all Italian epic poetry, was presently wielded with extraordinary charm and variety by Berni, Ariosto and Tasso. The merits of it were not perceived by the English poets of the 16th and 17th centuries, although the versions of Tasso by Carew (1594) and Fairfax (1600) and of Ariosto by Harington (1597) preserve its external construction. The stanzaic forms invented by Spenser and by the Fletchers have less real relation to ottava rima than is commonly asserted, and it is quite incorrect to say that the author of the Fairy Queen adapted himself. He added a ninth line to prevent the sound from being monotonously iterative. A portion of Browne's Britannia's Pastoral is composed in pure ottava rima, but this is the only important specimen in original Elizabethan literature. Two centuries later a very successful attempt was made to introduce in English poetry the flexibility and gaiety of ottava rima by John Hookham Frere, who had studied Pulci and Casti, and had caught the very movement of their diverting measure. His Whistlercoat appeared in 1817. This is a specimen of the ottava rima:

- But chiefly, when the shadowy moon had shed
  Her wood's mysterious lute,
  Their passive hearts and vacant stans
With thoughts and aspirations strange and new,
  Till their brave souls with inward working bred
  Dark hints that in the depths of instinct grew
  Subjection—not from Locke's associations,
  Nor David Hartley's doctrine of vibrations.

Byron was greatly impressed by the opportunities for satire involved in Frere's experiment, and in October 1817, in imitation of Whistlercoat, but keeping still closer to Pulci, he wrote Beppo. By far the greatest monument in ottava rima which exists in English literature is Don Juan (1819-1824). Byron also employed this measure, which was peculiarly adaptable to the purposes of his genius, in The Vision of Judgment (1822). Meanwhile Shelley also became acquainted with it, and in 1820 translated the hymns of Homer into ottava rima. The curious burlesque epic of William Tennant (?748-1848), Anster Fair (1812), which preceded all these, is written in what would be ottava rima if the eighth line were not an anadactyle. The form has been little used in other languages than Italian and English. It was employed by Boscan (1490-1542), who imitated Bembo vigorously in Spanish, and the very fine Amorosa of Eccelia y Zafiga (1533-1550) is in the same measure. Lope Vega Carpio wrote plentifully in ottava rima. In Portuguese poetry of the 16th and 17th centuries this measure obtained the sanction of Camoens, who wrote in it his immortal Lusisias (1572). Ottava rima has been attempted in German poetry by Uhland and others, but not for pieces of any considerable length.

OTTAWA, a tribe of North American Indians of Algonquian stock, originally settled on the Ottawa river, Canada, and later on the north shore of the upper peninsula of Michigan. They were driven in 1650 by the Iroquois beyond the Mississippi, only to be forced back by the Dakotas. Then they settled on Manitoulin Island, Lake Huron, and joined the French against the English. During the War of Independence, however, they fought for the latter. Some were moved to Indian Territory (Oklahoma), but the majority live to-day in scattered communities throughout lower Michigan and Ontario.

OTTAWA, the largest tributary of the river St Lawrence; ranking ninth in length among the rivers of Canada, being 685 m. long. It flows first westward to Lake Timiskaming; thence south-east and east. The principal tributaries are the left bank are the Rouge (117 m.), North Nation (62), Lievre (205), Gatineau (240), Cowlough (335), Dumoine (80); and on the right bank, the South Nation (90), Mississippi (103), Madawaska (130) and Petawawa (95). Canals at St Anne, Carillon and Grenville permit the passage of vessels drawing 9 ft., from Montreal up to the city of Ottawa. The river is connected with Lake Ontario by the Rideau Canal. The Chaudière Falls, and the Chats and other rapids, prevent continuous navigation above the capital, but small steamers ply on the larger navigable stretches. The Montreal, Ottawa and Georgian Bay Canal is designed to surmount these obstructions and provide a navigable channel from Georgian Bay up French river, through Lake Nipissing and over the height of land to the Ottawa, thence down to Montreal, of sufficient depth to enable vessels drawing 20 or 21 ft. to carry cargo from Chicago, Duluth, Fort William, &c. to Montreal, or, if necessary, to Europe, without breaking bulk. Except the suggested Hudson Bay route, this canal would form
the shortest route to the Atlantic seaboard from the great grain-producing areas of western America.

The Ottawa was first explored by Samuel de Champlain in 1613. Champlain describes many of its tributaries, the Chaudière and Rideau Falls, the Long Sault, Chats and other rapids, as well as the character of the river and its banks, with minuteness and reasonable accuracy. He places the Chaudière Falls in 45° 38', the true position being 45° 27'. The Long Sault Rapids on the Ottawa, about midway between Montreal and the capital, were the scene of one of the noblest exploits in Canadian history, when in 1661 the young Sieur des Ormeaux with sixteen comrades and a handful of Indian allies deliberately gave their lives to save New France from an invasion of the Iroquois. They intercepted the war party at the Long Sault, and for nearly a week held them at bay. When finally the last Frenchman fell under a shower of arrows, the Iroquois were thoroughly disheartened and returned crestfallen to their own country. For a hundred and fifty years thereafter the Ottawa was the great highway from Montreal to the west for explorers and fur-traders. The portage paths around its cataracts and rapids were worn smooth by the moccasined feet of countless adventurers and the woody banks ran with the inimitable chansons of Old Canada, as the canoe brigades swept swiftly up and down its broad stream. Throughout the 19th century the Ottawa was the thoroughfare of the lumbermen, whose immense rafts were carried down from its upper waters to Montreal and Quebec.

OTTAWA, a city of Carleton county, province of Ontario, and the capital of the Dominion of Canada, on the right bank of the Ottawa river, 101 m. W. of Montreal and 217 m. N.E. of Toronto. The main tower of the parliament building is in 45° 25' 28" N., and 75° 42' 03" W.

The city stands for the most part on a cluster of hills, 60 to 155 ft. above the river. It is on the main line of the Canadian Pacific railway, which affords direct communication with Montreal by two routes, the North Shore and the Short Line, one on either side of the Ottawa river. Branches of the same railway lead to Brockville, on the St. Lawrence river, passing through the town of Smith's Falls where connexion is made with the direct line from Montreal to Toronto; to Prescott, also on the St. Lawrence; northward through the Gatineau valley to Maniwaki, in the heart of a famous sporting country, and westward to Waltham, on the north side of the Ottawa. The Grand Trunk offers a third route to Montreal, and another line of the same railway leads to Parry Sound, on Georgian Bay. The Ottawa and New York (New York Central) runs to Cornwall, on the St. Lawrence, thence to New York. Electric railways afford communication with all parts of the city and extend eastward to Rockliffe Park and the riel ranges, westward to Britannia on Lake Deschenes, and through the neighbouring town of Hull to Aylmer and Victoria Park. During the summer months steamers ply down the Ottawa to Montreal, and by way of the Rideau canal and lakes to Kingston on the St. Lawrence.

A road bridge, partially destroyed in the great fire of 1900, connects Ottawa with Hull; a railway bridge spans the river above the falls and crosses the Rideau. The canal submerged below the falls, carries both steam and electric railway tracks, as well as roadways for vehicular and pedestrian traffic. The site of the city is exceedingly picturesque. For 3 m. it follows the high southern bank of the Ottawa, from the Chaudière Falls, whose mist-crowned cauldron is clearly visible from the summit of Parliament Hill, to and beyond the Rideau Falls, so named by early French explorers because of their curtain-like appearance. The Rideau, a southern tributary of the Ottawa, once formed the eastern boundary of the city, which, however, is now absorbing a string of suburbs that lie along its eastern banks. The Rideau Canal cuts the city in two, the western portion being known as Upper Town and the eastern as Lower Town. Roughly speaking the canal divides the two sections of the population, the English occupying Upper Town and the French Lower Town, though Sandy Hill, a fashionable residential district east of the canal, is mainly occupied by the English. Opposite and a little below the mouth of the Rideau, the Gatineau flows into the Ottawa from the north. Above the Chaudière Falls the river is broken by the Deschenes Rapids, and beyond these again it expands into Lake Deschenes, a favourite summer resort for the people of the city. To the north lie the Laurentian Hills, broken by the picturesque Gatineau Valley.

The crowning architectural feature of the city is the splendid group of Gothic buildings on the summit of Parliament Hill, whose limestone bluffs rise 150 ft. sheer from the river. The three blocks of these buildings form sides of a great quadrangle, the fourth side remaining open. The main front of the central or Parliament building is 470 ft. long and 40 ft. high, the Victoria Tower (180 ft. high) rising over the principal entrance. Behind and connected with the Parliament building is an admirably proportioned polygonal hall, 90 ft. in diameter, in which the library of parliament is housed. The corner stone of the main building was laid by the then prince of Wales in 1860. The buildings forming the eastern and western sides of the quadrangle are devoted to departments of the Dominion government. To the south, but outside the grounds of Parliament Hill, stands the Langevin Block, a massive structure in brown sandstone, also devoted to departmental purposes. The increasing needs of the government have made necessary the erection of several other buildings and an effort has been made to bring as many of these as possible into a harmonious group. The Archives building and the Royal Mint stand on the commanding eminence of Nepean Point, to the eastward of Parliament Hill, the Rideau Canal lying between. Two large departmental buildings occupy ground south of the Archives building and facing Parliament Hill, one containing the Supreme Court as well as the Federal Department of Justice. At the foot of Metcalfe Street, south of Parliament Hill, stands the Victoria Museum, with the department of mines, with the splendid collections of the Geological and Natural History Museum, the departmental library, and the National Art Gallery. The Dominion Observatory stands outside the city, in the grounds of the Central Experimental Farm. Plans were approved in 1909 by the government for a union railway station east of the canal, and immediately south of Rideau Street, and a large hotel (Grand Trunk Railway), the Chateau Laurier, at the southern end of Major's Hill Park. Other prominent buildings are the city hall, post office, Carnegie library, normal and model schools, government printing bureau, county court house, the Basilar or Roman Catholic cathedral, and Christ Church cathedral (Church of England), the Roman Catholic university of Ottawa and the collegiate institute.

The city charities include four large general hospitals, two of which are under Protestant auspices; one is controlled by Roman Catholics; the fourth is devoted to contagious diseases. Ottawa is the seat of the Church of England bishop of Ottawa, and of the Roman Catholic archbishop of Ottawa. Several of the philanthropic and educational orders of the latter church are established here, in nunneries, convents or monasteries. As elsewhere in Ontario, the educational system is divided into public schools (undenominational), and separate schools (Roman Catholic), the latter supported by Roman Catholic taxpayers, the former by all other members of the community. The collegiate institute is common to both, and is used as a preparatory school for the universities.

Ottawa has been a great seat of the lumber trade, and the manufacture of lumber still forms an important part of the industrial life of the city, but the magnificent waterpowers of the Chaudière and Rideau Falls are now utilized for matchworks, flour-mills, foundries, carbide factories and many other flourishing industries, as well as for the development of electric light and power, for the lighting of the city and the running of the electric railways.

The people of Ottawa possess a number of public parks, both within and outside the city, partly the result of their own foresight, and partly due to the labours of the Government Improvement Commission. Parliament Hill itself constitutes a park of no mean proportions, one of the noted features of which is the beautiful Lover's Walk, cut out of the side of the cliff half way between the river and the summit. The grounds above contain
statues of Queen Victoria, as well as of Sir John Macdonald, Alexander Mackenzie, Sir George Cartier and other Canadian political leaders. On the eastern side of the canal is Major's Hill Park, maintained by the government. Below Sandy Hill, on the banks of the Rideau, lies Strathcona Park, an admirable piece of landscape gardening constructed out of what was once an unsightly swamp. Crossing the bridges above the Rideau Falls, and passing the heavily wooded grounds of Rideau Hall, the official residence of the governor-general, we come to Rockliffe Park, beyond which lies the government rifle ranges. Rockliffe Park is the easternmost point of an ambitious scheme of landscape gardening planned by the Improvement Commission. From here a driveway extends to Rideau Hall; thence it crosses the Rideau river to a noble thoroughfare cut through the heart of Lower Town, and known as King Edward Avenue. Crossing the canal by the Laurier bridge, the driveway turns south and follows the west bank of the canal for 4 m. to the Central Experimental Farm, an extensive tract of land upon which experiments in model farming are carried out by government specialists, for the benefit of Canadian farmers. From the Experimental Farm the driveway winds northward and the western side of the city to the bank of the Ottawa, connecting by light bridges with a group of islands above the Chaudière Falls which are to be converted into a park reserve.

Ottawa is governed by a mayor, elected by the city at large; a board of control consisting of four members, similarly elected and a board of 16 aldermen, 2 elected by each of the 8 wards. The city returns 2 members to the Dominion House of Commons and two to the provincial legislature.

The population, of which one-third is French-speaking, the remainder English (with the exception of a small German element), has increased rapidly since the incorporation of the city in 1854. It was 59,928 in 1901; 67,572 in 1906; and in 1907, including the suburbs and the neighbouring town of Hull, over 100,000.

The earliest description of the site of Ottawa is that of Samuel de Champlain, in his Voyages. In June 1613, on his way up the river, he came to a tributary on the south side, "at the mouth of which is a marvellous fall. For it descends a height of twenty or twenty-five fathoms with such impetuosity that it makes an arch nearly four hundred paces broad. The savages take pleasure in passing under it, not wetting themselves, except from the spray that is thrown off." This was the Rideau Falls, but a good deal of allowance must be made for exaggeration in Champlain's account. Continuing up the river, "we passed," he says, "a fall, a league from which, there is half a league broad and has a descent of six or seven fathoms. There are many little islands. The water falls in one place with such force upon a rock that it has hollowed out in course of time a large and deep basin, in which the water has a circular motion and forms large eddies in the middle, so that the savages call it Asticou, which signifies boiler. This cataract produces such a noise in this basin that it is heard for more than two leagues." The present name, Chaudière, is the French equivalent of the old Indian name. For two hundred years and more after Champlain's first visit the Chaudière portage was the main thoroughfare from Montreal to the great western fur country; but it was not until 1850 that any permanent settlement was made in the vicinity. See that year Philemon Wright, of Woburn, Massachusetts, built a home for himself at the foot of the portage, on the Quebec side of the river, where the city of Hull now stands; but for some time the precipitous cliffs on the south side seem to have discouraged settlement there. Finally about 1820 one Nicholas Sparks moved over the river and cleared a farm in what is now the heart of Ottawa. Seven years later Colonel John By, R.E., was sent out to build a canal from a point below the Chaudière Falls to Kingston on Lake Ontario. The canal, completed at a cost of $2,500,000, has never been of any great commercial importance; it has never been called upon to fulfil its primary object, as a military work to enable gun-boats and military supplies to reach the lakes from Montreal without being exposed to attack along the St Lawrence frontier. The building of the canal created a fairly sized settlement at its Ottawa end, which came to be known as Bytown. As the lumber trade developed Bytown rapidly increased in wealth and importance. In 1854 it was incorporated as a city, the name being changed to Ottawa; and four years later Queen Victoria selected Ottawa as the capital of Canada. Ottawa was admirably situated for a capital from a political and military point of view; but there is reason to believe that the deciding factor was the pressure exerted by the four other rival claimants, Montreal, Quebec, Toronto and Kingston, any three of which would have fiercely resented the selection of the fourth. The first session of parliament in the new capital was opened in 1865.

Ottawa, a city and the county-seat of La Salle county, Illinois, U.S.A., on the Illinois river, at the mouth of the Fox, about 84 m. S.W. of Chicago. Pop. (1900) 10,588, of whom 1804 were foreign-born; (1910 census) 9535. It is served by the Chicago, Burlington & Quincy, and the Chicago, Rock Island & Pacific railways, by interurban electric railways, and by the Illinois & Michigan Canal. There is a monument at Ottawa to the 1400 soldiers from La Salle county who died in the Civil War, and among the public buildings are the County Court House, the Court House for the second district of the Illinois Appellate Court, and Reddick's Library, founded by William Reddick. Ottawa is the seat of the Pleasant View Luther College (co-educational), founded in 1866 by the Norwegian Lutherans of Northern Illinois. There is a medicinal spring, the water of which is called "Sanigula," water. The width of the city is derived from eight deep wells. There are about 150 privately owned arseneaux. In the vicinity are large deposits of coal, of glass-sand, and of clay suitable for brick and tile. The city's manufactures include glass, brick, tile, carriages and wagons, agricultural implements, pianos and organs and cigars. The value of the factory products increased from $1,737,884 in 1900 to $2,078,139 in 1905, or 16.6%.

The mouth of the Fox was early visited by French explorers, and Father Hennepin is said to have discovered here in 1680 the first deposit of coal found in America. On Starved Rock, a bold hillock about 125 ft. high, on the southern bank of the Illinois, about midway between Ottawa and La Salle, the French explorer La Salle, assisted by his lieutenant Henre de Tonty and a few Canadian voyageurs and Illinois Indians, established (in December 1682) Fort St Louis, about which he gathered nearly 20,000 Indians, who were seeking protection from the Iroquois. The plateau-like summit, which originally could be reached only by a steep path, was considered almost impregnable to Indian attack by a sheer cliff on the river side of the hill, a deep ravine along its eastern base and steep declivities on the other sides. On the summit La Salle built store-houses and log huts, which he surrounded by intrenchments and a log palisade. The post was used by fur traders as late as 1718. The hill has borne its present name since about 1770, when it became the last refuge of a small band of Illinois flying before a large force of Pottawatomies, who believed that an Illinois had assassinated Pontiac, in whose conspiracy the Pottawatomies had taken part. Unable to dislodge the Illinois, the Pottawatomies cut off their escape and let them die of starvation. Ottawa was laid out in 1839, incorporated as a village in 1838 and chartered as a city in 1853. On the 21st of August 1858 the first of the series of political debates between Abraham Lincoln and Stephen A. Douglas, in their contest for the United States senatorship, was held at

370
Ottawa. The semi-centennial of this debate was celebrated in 1908, when the Illini Chapter, Daughters of the American Revolution, caused a suitably inscribed boulder weighing 24 tons to be set up in Washington Park as a memorial.

OTTAWA, a city and the county-seat of Franklin county, eastern Kansas, U.S.A., situated on the Osage (Marais des Cygnes) river, about 58 m. (by rail) S.W. of Kansas City. Pop. (1900) 6334, of whom 333 were foreign born; (1910) 7670. It is served by the Atchison, Topeka & Santa Fé (which has large repair shops here) and the Missouri Pacific railways. There is a Carnegie library, and Forest Park, within the city limits, is a popular meeting place of conventions and summer gatherings, including the annual Ottawa Chautauqua Assembly. Ottawa University (Baptist) was established here in 1865, as the outgrowth of Roger Williams University, which had been chartered in 1860 for the education of Indians on the Ottawa Reservation, and had received a grant of 20,000 acres from the Federal government in 1862. The university comprises an academy, a college, a school of fine arts and a commercial college, and in 1900 had 406 students. Ottawa has an important trade in grain and live-stock; soft coal and natural gas are found in the vicinity; the town, which was incorporated in 1854, is situated on the Chicago, Rock Island & Pacific Railway, and on the Atchison, Topeka & Santa Fé. Ottawa was settled in 1854, and was first chartered as a city in 1866.

OTTER (O. Eng. ote, otor, a common Teutonic word, cf. Dutch and Ger. Otter, Dan. oder, Swed. utter; it is to be referred to the root seen in Gr. ὅτε, water), a name properly given to the well-known European carnivorous aquatic mammal (Lutra vulgaris, or L. lutra), but also applicable to all the members of the lutrine section of the family Mustelidae (see Carnivora). The otter has an elongated, low body, short limbs, short broad feet, with five toes on each, connected together by webs, and all with short, moderately strong, compressed, curved, pointed claws. Head rather small, broad and flat; muzzle very broad; whiskers thick and strong; eyes small and black; ears short and rounded. Tail a little more than half the length of the body and head together, broad and strong at the base, and gradually tapering to the end, somewhat flattened horizontally. The fur is of fine quality, consisting of a soft white fluffy grey under-fur, brown at the tips, interspersed with longer, stiffer and thicker hairs, shining, greyish at the base, bright rich brown at the points, especially on the upper-parts and outer surface of the legs; the throat, cheeks, under-parts and inner surface of the legs brownish grey throughout. Individual otters very in size. The total length from the nose to the end of the tail averages about 3.5 ft., of which the tail occupies 1.5 ft. or 1.4 in. The weight of a full-sized male is from 18 to 24 lb, that of a female about 14 lb less.

As the otter lives almost exclusively on fish, it is rarely met with far from water, and usually frequents the shores of brooks, rivers, lakes and, in some localities, the sea itself. It is a most expert swimmer and diver, easily overtaking and seizing fish in the water; but when it has captured its prey it brings it to shore to devour. When lying upon the bank, it holds the fish between its fore-paws, commences at the head and then eats gradually towards the tail, which it is said to leave. The female produces three to five young ones in March or April, and brings them up in a nest formed of grass or other herbage, usually placed in a hollow place in the bank of a river, or under the shelter of the roots of some overhanging tree. The otter is found in localities suitable to its habits throughout Great Britain and Ireland, though less abundantly than formerly, for, being destructive to fish, it is rarely allowed to live in peace when its haunts are discovered. Otter-hunting with packs of hounds of a special breed, and trained for the purpose, is a pastime in many parts of the country. It was formerly the practice to kill the otter with long spears, which the huntsmen carried; now the quarry is picked up and "talled," or run into by the pack.

The otter ranges throughout the greater part of Europe and Asia; and a closely allied but larger species, L. canadensis, is extensively distributed throughout North America, where it is pursued for its fur. An Indian species, L. nair, is trained by the natives of some parts of Bengal to assist in fishing, by driving the fish into the nets. In China otters are taught to catch fish, being let into the water for the purpose attached to a long cord.

Otters are widely distributed, and, as they are much alike in size and coloration, their specific distinctions are by no means well defined. Besides those mentioned above, the following have been described, L. californica, North America; L. jactina, Central America, Peru, and Chili; L. brasiliensis, Brazil; L. maculicola, South Africa; L. whitneyi, Japan; L. chinensis, China and Formosa, and other species. Some, with the feet only slightly webbed, and the claws exceedingly small or altogether wanting on some of the toes, and also with some difference in dental characters, have been separated as a distinct genus, Aonyx. These are L. inunguis from South Africa and L. cineria from India, Java, and Sumatra.

More distinct still is the sea-otter (Lalax, or Enhydra, lutris). The entire length of the animal from nose to end of tail is about 4 ft., so that the body is considerably larger and more massive than that of the European otter. The skin is peculiarly loose, and stretches when removed from the animal. The fur is quite remarkable for the preponderance of the beautifully soft woolly under-fur, the longer stiffer hairs being scanty. The general colour is deep liver-brown, silvered or frosted with the hoary tips of the longer stiffer hairs. These are, however, removed when the skin is dressed for commercial purposes.

Sea-otters are only found upon the rocky shores of certain parts of the North Pacific Ocean, especially the Aleutian Islands and Alaska, extending as far south on the American coast as Oregon; but, owing to the persecution to which they are subjected for the sake of their valuable skins, their numbers are greatly diminishing. The otters are captured by spear, clubbing, nets and bullets. They do not feed on fish, like true otters, but on clams, mussels, sea-urchins and crabs; and the female brings forth but a single young one at a time, apparently at any season of the year. They are excessively shy and wary; young cubs are often captured by the hunters who have killed the dam, but all attempts to rear them have hitherto failed.

See Elliott Coues, Monograph on North American Fur-bearing Animals (1877).

OTTERY ST MARY, a market town in the Honiton parliamentary division of Devonshire, England, 15 m. E. of N. of Exeter, on a branch of the London & South-Western railway. Pop. of urban district (1901) 3495. It is pleasantly situated in the rich valley of the small river Otter. The parish church, the finest in the county, is cruciform, and has the unique feature of transeptal towers, imitated from Exeter Cathedral. The northern has a low spire. The church, which is Early English, with Decorated and Perpendicular additions, contains several ancient tombs. The manor of Ottery belonged to the abbey of Rouen in the time of Edward the Confessor. The church was dedicated in 1260 by Walter Bromescombe, bishop of Exeter; and c. 1335 Bishop John Grandisson, on founding
a secular college here, greatly enlarged the church; it has been thought that, by copying the Early English style, he is responsible for more of the building than is apparent. The town has a large agricultural trade. It is the birthplace of Samuel Taylor Coleridge (1772) and of John Murray Scott, and in youth, his knowledge of the locality appearing in *Pendennis*.

**OTTIGNIES**, a town of Belgium, in the province of Brabant. It is an important station on the main line from Brussels to Namur, and forms the point of junction with several cross lines. It has extensive modern flower and vegetable gardens. Pop. (1904) 2405.

**OTTO**, king of Greece (1815–1867), was the second son of Louis I, king of Bavaria, and his wife Teresa of Saxe-Altenburg. He was born at Salzburg on the 1st of June 1815, and was educated at Munich. In 1832 he was chosen by the conference of London to occupy the newly-erected throne of Greece, and on the 6th of February 1833 he landed at Nauplia, then the capital of independent Greece. Otto, who was not yet eighteen, was accompanied by a council of regency composed of Bavarians under the presidency of Count Josef Ludwig von Armansperg (1787–1853), who as minister of finance in Bavaria had succeeded in restoring the credit of the state at the cost of his popularity. The task of governing a semi-barbarous people, but recently emancipated, divided into bitter factions, and filled with an exaggerated sense of their national destiny, would in no case have been easy; it was not facilitated by the bureaucratic methods introduced by the regents. Though Armansperg, with his colleagues did a good deal to introduce system and order into the infant state, they contrived to make themselves hated by the Greeks, and with sufficient reason. That the regency refused to respond to the demand for a constitution was perhaps natural, for the experience of constitutional experiments in emancipated Greece had not been encouraging. The result, however, was perpetual unrest; the regency, too, was divided into a French and a Russian party, and distracted by personal quarrels, which led in 1834 to the recall by King Louis of G. L. von Maurer and Karl von Abel, who had been in bitter opposition to Armansperg. Soon afterwards the Mainotes were in open revolt, and the money obtained from foreign loans had to be spent in organizing a force to preserve order. On the 1st of June 1835 Otto came of age, but, on the advice of his father and under pressure of Great Britain and of the house of Rothschild, who all believed that a capable finance minister was the supreme need of Greece, he retained Armansperg as chancellor of state. The wisdom of this course was more than doubtful; for the expenses of government, of which the conversion of Athens into a dignified capital was not the least, exceeded the resources of the exchequer, and the state was only saved from bankruptcy by the continual intervention of the powers. Though King Louis, as the most exalted of Philhellenes, received an enthusiastic welcome when he visited Greece in the winter of 1835, his son's government grew increasingly unpopular. The Greeks were more heavily taxed than under Turkish rule; they had exchanged government by the sword, which they understood, for government by official regulations, which they hated; they had escaped from the sovereignty of the Mussulman to fall under that of a devout Catholic, to them a heretic. Otto was well intentioned, honest and inspired with a genuine affection for his adopted country; but it needed more than mere amiable qualities to reconcile the Greeks to his rule.

In 1837 Otto visited Germany and married the beautiful and talented Princess Amalie of Oldenburg. The union was essentially political, and the new queen made herself unpopular by interfering in the government. Meanwhile, at the instance of the Swiss Philhellenic Eynard, Armansperg had been dismissed by the king immediately on his return, but a Greek minister was not put in his place, and the granting of a constitution was still postponed. The attempts of Otto to conciliate Greek sentiment by efforts to enlarge the frontiers of his kingdom, e.g. by the suggested acquisition of Crete in 1841, failed of their object and only succeeded in embroiling him with the powers. His power rested wholly on Bavarian bayonets; and when, in 1843, the last of the German troops were withdrawn, he was forced by the outbreak of a revolutionary movement in Athens to grant a constitution and to appoint a minister of native Greeks.

With the grant of the constitution Otto's troubles increased. The Greek parliament, like its predecessors during the War of Liberation, was the battleground of factions divided, not by national issues, but by their adherence to one or other of the great powers that made Greece the arena of their rivalry for the control of the Mediterranean. Otto thought to counteract the effects of political corruption and incompetence by overriding the constitution to which he had sworn. The attempt would have been perilous even for a strong man, a native ruler and an Orthodox believer; and Otto was none of these. His prestige, moreover, suffered from the "Pacifico incident" in 1850, when Palmerston caused the British fleet to blockade the Peiraeus, to exact reparation for injustice done to a Levantine Jew who had happened also to be a British subject. For the ill-advised intervention in the Crimean War, which led to a second occupation of the Peiraeus, Otto was not responsible; his consent had been given under protest as a concession to popular clamour. His position in Greece was, however, becoming untenable. In 1861 a student named Drusios attempted to murder the queen, and was hailed by the populace as a modern Harmodios. In October 1862 the troops in Acharnæa under General Theodore Sfakianakis rebelled for a while. King Otto, positive in thought, followed suit; a provisional government was set up and summoned a national convention. The king and queen, who were at sea, took refuge on a British war-ship, and returned to Bavaria, where they were lodged by King Louis in the palace of the former bishops of Bamberg. Here, on the 26th of July 1867, Otto died. He had become strangely persuaded that he held the throne of Greece by divine right; and, though he made no effort to regain it, he refused to acknowledge the validity of the election of Prince George of Denmark.

**OTTO I.** (912–973), surnamed the Great, Roman emperor, eldest son of Henry I. the Fowler by his second wife Matilda, said to be a descendant of the Saxon hero Wulf directed, was born on the 23rd of November 912. Little is known of his early years, but he probably shared in some of his father's campaigns. In 929 he married Edith, daughter of Edward the Elder, king of the English, and sister of the reigning sovereign of the *Áedhelan*. It is said that Matilda wished her second son Henry to succeed his father, as this prince, unlike his elder brother, was born the son of a king. However this may be, Henry named Otto his successor, and after his death in July 936 Otto was chosen German king and crowned at Rheinfels, archbishop of Mainz. This ceremony, according to the historian Widukind, was followed by a banquet at which the new king was waited upon by the dukes of Lorraine, Bavaria, Franconia and Swabia. Otto soon showed his intention of breaking with the policy of his father, who had been content with a nominal superiority over the duchies; in 937 he punished Eberhard, duke of Franconia, for an alleged infringement of the royal authority; and in 938 he deposed Eberhard, who had recently become duke of Bavaria. During these years the Bohemians and other Slavonic tribes ravaged the eastern frontier of Germany, but although one expedition against them was led by the king in person, the defence of this district was left principally to agents. Trouble soon arose in Saxony, probably owing to Otto's refusal to give certain lands to his half-brother, thanckmar, who, although the king's senior, had been passed over in the succession as illegitimate. Thanckmar, aided by an influential Saxon noble named Wichmann, and by Eberhard of Franconia, seized...
the fortress of Eresburg and took Otto's brother Henry prisoner; but soon afterwards he was defeated by the king and killed whilst taking sanctuary. The other conspirators were pardoned, but in 930 a fresh revolt broke out under the leadership of Henry, and Giselbert, duke of Lorraine. Otto gained a victory near Xanten, which was followed by the surrender of the fortresses held by his brother's adherents in Saxony, but the rebels, joined by Eberhard of Franconia and Archbishop Frederick of Mainz, continued the struggle, and Giselbert of Lorraine transferred his allegiance to Louis IV., king of France. Otto's precarious position was saved by a victory near Andernach when Eberhard was killed, and Giselbert drowned in the subsequent flight. Henry took refuge with Louis of France, but was soon restored to favour and entrusted with the duchy of Lorraine, where, however, he was unable to restore order. Otto therefore crossed the Rhine and deprived his brother of authority. Henry then became involved in a plot to murder the king, which was discovered in time, and the good offices of his mother secured for him a pardon at Christmas 941. The deaths of Giselbert of Lorraine and Eberhard of Franconia, quickly followed by those of two other dukes, enabled Otto to unite the stem-duchies more closely with the royal house. In 944 Lorraine was given to Conrad, surnamed the Red, who in 947 married the king's daughter Liutgard; Franconia was retained by Otto in his own hands; Henry married a daughter of Arnulf, duke of Bavaria, and received that duchy in 947; and Swabia came in 946 to the king's son Ludolf, who had married Ida, a daughter of the late duke, Hermann. During these years the tribes living between the Elbe and the Oder were made tributary, bishoprics were founded in this district, and in 950 the king himself marched against the Bohemians and reduced them to submission. Strife between Otto and Louis IV. of France had arisen when the French king sought to obtain authority over Lorraine and aided the German rebels in 936; but after the German king had undertaken an expedition against France, peace was made in 945. Afterwards, when Louis became a prisoner in the hands of his powerful vassal Hugh the Great, duke of France, Otto attacked the duke, who, like the king, was his brother-in-law, captured Reims, and negotiated a peace between the two princes; and in subsequent struggles between them his authority was several times involved.

In 945 Berengar I., margrave of Ivrea, left the court of Otto and returned to Italy, where he soon obtained a mastery over the country. After the death in 953 of Lothair, king of Italy, Berengar sought the hand of his widow Adelaide for his son Adalbert; and Henry of Bavaria and Ludolf of Swabia had already been meddlesome independently of each other in the affairs of northern Italy. In response to an appeal from Adelaide, Otto crossed the Alps in 953. He assumed the title of king of the Lombards, and having been a widower since 946, married Adelaide and negotiated with pope Agapetus II. about his reception in Rome. The influence of Alberic, prince and senator of the Romans, prompted the pope returning a favourable answer to the king's request. But when Otto returned to Germany in 952 he was followed by Berengar, who did homage for Italy at Augsburg. The chief advisers of Otto at this time were his wife and his brother Henry. Henry's influence seems to have been resented by Ludolf, who in 946 had been formally designated as his father's successor. When Adelaide bore a son, and a report gained currency that Otto intended to make this child his heir, Ludolf rose in revolt and was joined by Conrad of Lorraine and Frederick of Mainz. Otto fell into the power of the rebels at Mainz and was compelled to agree to demands made by them, which, however, he promptly revoked on his return to Saxony. Ludolf and Conrad were declared deposed, and in 953 war broke out in Lorraine and Swabia, and afterwards in Saxony and Bavaria. Otto failed to take Mainz and Augsburg; but an attack on the part of Conrad and Ludolf to gain support from the Magyars, who had seized the opportunity to invade Bavaria, alienated many of their supporters. Otto's brother Bruno, archbishop of Cologne, was successful in restoring the royal authority in Lorraine, so that when Conrad and Frederick soon afterwards submitted to Otto, the struggle was confined to Bavaria. Ludolf was not long in following the example of Conrad; and with the capture of Regensburg in 955 the rising ended. Conrad and Ludolf retained their estates, but their dukies were not restored to them. Meanwhile the Magyars had renewed their ravages and were attacking Augsburg. Otto marched against them, and in a battle fought on the Lechfeld on the 10th of August 955 the king's troops gained a brilliant victory which completely freed Germany from these invaders; while in the same year Otto also defeated the Slavs who had been ravaging the Saxon frontier.

About this time the king seems to have perceived the necessity of living and ruling in closer union with the church, a change of policy due perhaps to the influence of his brother Bruno, or forced upon him when his plans for uniting the dukies with the royal house brought rebellion in their train. Lands and privileges were granted to prelates, additional bishoprics were founded, and some years later Magdeburg was made the seat of an archbishop. In 960 Otto was invited to come to Italy by Pope John XII., who was hard pressed by Berengar, and he began to make preparations for the journey. As Ludolf had died in 957 and Otto, his only son by Adelaide, had been chosen king at Worms, the government was entrusted to Bruno of Cologne, and Archbishop William of Mainz, a natural son of the king. Reaching Pavia at Christmas 961, the king promised to defend and respect the church. He then proceeded to Rome, where he was crowned emperor on the 2nd of February 962. After the ceremony he confirmed the rights and privileges which had been conferred on the papacy, while the Romans promised obedience, and Pope John took an oath of fidelity to the emperor. But as he did not long observe his oath he was deposed at a synod held in St Peter's, after Otto had compelled the Romans to swear they would elect no pope without the imperial consent; and a nominee of the emperor, who took the name of Leo VIII., was chosen in his stead. A pestilence drove Otto to Germany in 963, and finding the Romans again in arms on his return in 966, he allowed his soldiers to sack the city, and to take the leaders of the rebellion. His next move was against the Greeks and Saracens in southern Italy, but seeking to attain his objects by negotiation, sent Liudprand, bishop of Cremona, to the eastern emperor Nicephorus II. to arrange for a marriage treaty between the two empires. Nicephorus refused to admit the validity of Otto's title, and the bishop was roughly repulsed; but the succeeding emperor, John Zimisces, was more reasonable, and Theophano, daughter of the emperor Romanus II., was married to the younger Otto in 972. The same year witnessed the restoration of peace in Italy and the return of the emperor to Germany, where he received the homage of the rulers of Poland, Bohemia and Denmark; but he died suddenly at Memleben on the 7th of May 973, and was buried at Magdeburg.

Otto was a man of untiring perseverance and relentless energy, with a high ideal of his position. His policy was to crush all tendencies to independence in Germany, and this led him to grant the stem-duchies to his relatives, and afterwards to ally himself with the church. Indeed the necessity for obtaining complete control over the church was one reason which induced him to obtain the imperial crown. By this step the pope became his vassal, and a divided allegiance was rendered impossible for the German clergy. The Roman empire of the German nation was indeed less universal and less theoretic under Otto, its restorer, than under Charlemagne, but what it lacked in splendour it gained in stability. His object was not to make the state religious but the church political, and the clergy must first be officials of the king, and secondly members of an ecclesiastical order. He shared the piety and superstition of the age, and did much for the spread of Christianity. Although himself a stranger to letters he welcomed scholars to his court and eagerly seconded the efforts of his brother Bruno to encourage learning; and while he neither feared nor shirked battle, he was always ready to secure his ends by peaceful means. Otto was of tall and commanding presence, and although subject to violent bursts of passion, was liberal to his friends and just to his enemies.

OTTO II.—OTTO III.

**OTTO II.** (955–983), Roman emperor, was the son of the emperor Otto the Great, by his second wife Adelaide. He received a good education under the care of his uncle, Bruno, archbishop of Cologne, and his illegitimate half-brother, William, archbishop of Mainz. He was chosen German king at Worms, 961, crowned at Aix-la-Chapelle on the 26th of May 961, and on the 25th of December 967 was crowned joint emperor at Rome by Pope John XIII. On the 14th of April 972 he married Theophano, daughter of the eastern emperor Romanus II., and after sharing in various campaigns in Italy, returned to Germany and began to act as his father's father (Otto 973). After suppressing a rising in Lorraine, difficulties arose in southern Germany, probably owing to Otto's refusal to grant the duchy of Swabia to Henry II., the Quarrersome, duke of Bavaria. The first conspiracy was easily suppressed, and in 974 an attempt on the part of Harold III., king of the Danes, to throw off the German yoke was also successfully resisted; but an expedition against the Bohemians led by the king in person in 975 was a partial failure owing to the outbreak of further trouble in Bavaria. In 976 Otto deposed Duke Henry, restored order for the second time in Lorraine, and made another expedition into Bohemia in 977, when King Boleslaus II. promised to return to his earlier allegiance. Having crushed an attempt made by Henry to regain Bavaria, Otto was suddenly attacked by Lothair, king of France, who held Aix in his possession for a few days, but when the emperor retaliated by invading France he met with little resistance. He was, however, compelled by sickness among his troops to raise the siege of Paris, and on the 24th July 976 the fleet, by which he had destroyed his enemies' ships by fire, was followed by peace with France, when Lothair renounced his claim on Lorraine. The emperor then prepared for a journey to Italy. In Rome, where he restored Pope Benedict VII., he held a splendid court, attended by princes and nobles from all parts of western Europe. He was next required to punish inroads of the Saracens on the Italian mainland, and in September 981 he marched into Apulia, where he met at first with considerable success; but an alliance between the Arabs and the Eastern Empire, whose hostility had been provoked by the invasion of Apulia, resulted in a severe defeat on Otto's troops near Stilo in July 982. Without revealing his identity, the emperor escaped on a Greek vessel to Rossano. At a diet held at Verona, largely attended by German and Italian princes, a fresh campaign was arranged against the Saracens. Proceeding to Rome, Otto secured the election of Peter of Pavia as Pope John XIV. Just as the news reached him of a general rising of the tribes on the eastern frontier, Otto reached Rome, where he was crowned on the 7th of December 983. He left a son, afterwards the emperor Otto III., and three daughters. He was buried in the atrium of St Peter's, and when the church was rebuilt his remains were removed to the crypt, where his tomb may still be seen. Otto, who is sometimes called the "Red," was a man of small stature, by nature brave and impulsive, and by training an accomplished knight. He was generous to the church and aided the spread of Christianity in many ways.

**OTTO III.** (980–1002), Roman emperor, son of the emperor Otto II. and Theophano, daughter of the eastern emperor Romanus II., was born in July 980, chosen as his father's successor at Verona in June 983 and crowned German king at Aix-la-Chapelle on the 25th of the following December. Otto II. had died a few days before this ceremony, but the news did not reach Germany until after the coronation. Early in 984 the king was seized by Henry II., the Quarrersome, the deposed duke of Bavaria, who claimed the regency as a member of the reigning house, and probably entertained the idea of obtaining the kingly dignity himself. A strong opposition was quickly aroused, and when Theophano and Adelaide, widow of the emperor Otto the Great, appeared in Germany, Henry was compelled to hand over the young king to his mother. His mental gifts were considerable, and also he was so refined in education that he was called the "wonder of the world." The government of Germany during his minority was in the hands of Theophano, and after her death in June 991 passed to a council in which the chief influence was exercised by Adelaide and Willigis, archbishop of Mainz. Having accompanied his troops in expeditions against the Bohemians and the Wends, Otto was declared of age in 995. In 996 he crossed the Alps and was recognized as king of the Lombards at Pavia. Before he reached Rome, Pope John XV., who had invited him to Italy, had died, whereupon he raised his own cousin Bruno, son of Otto duke of Carinthia, to the papal chair as Pope Gregory V., and by this pontiff Otto was crowned emperor on the 21st of May 996. On his return to Germany, the emperor learned that Gregory had been driven from Rome, which was again in the power of John Crescentius, patrician of the Romans, and he took to the new king, John XVI., who had been elected. Leaving his aunt, Matilda, abbess of Quellinburg, as regent of Germany, Otto, in February 998, led Gregory back to Rome, took the castle of St Angelo by storm and put Crescentius to death. A visit to southern Italy, where many of the princes did homage to the emperor, was cut short by the death of the pope, to whose chair Otto then appointed his former tutor Gerbert, who took the name of Sylvester II. In the palace which he built on the Avenjine, Otto sought to surround himself with the splendour and ceremonial of the older emperors of Rome, and dreamed of making Rome once more the centre of a universal empire. Many names and customs were introduced into his court from that of Constantinople; he proposed to restore the Roman senate and consultate, revived the office of patrician, called himself "consul of the Roman senate and people" and issued a seal with the inscription, "restoration of the Roman empire." Passing from pride to humility he added "servant of the apostle," and "servant of God Francis," to the imperial title, spent a fortnight in prayer in the grotto of St Charlemagne, and was buried in various Italian monasteries. Leaving Italy in the summer preceding the year 1000, when it was popularly believed that the end of the world was to come, Otto made a pilgrimage to the tomb of his old friend Adalbert, bishop of Prague, at Gnesen, and raised the city to the dignity of an archbishopric. He then went to Aix, and opened the tomb of Charlemagne, where, according to a legendary tale, he found the body of the great emperor sitting upright upon a throne, wearing the crown and holding the sceptre. Returning to Rome, trouble soon arose between Otto and the citizens, and for three days the emperor was besieged in his palace. After a temporary peace, he fled to the monastery of Classe near Ravenna. Troops were collected, but whilst conducting a campaign against the Romans, Otto died at Paterno near Viterbo on the 23rd of January 1002, and was buried in the cathedral at Aix-la-Chapelle. Tradition
sickel once, being beaten by Italy. He was opposed by the eminents clerics with whom he was thoroughly associated. **Otto IV.** (c. 1182-1218), Roman emperor, second son of Henry the Lion, duke of Saxony, and Matilda, daughter of Henry II., king of England, was most probably born at Argentor in central France. His father died when he was still young, and he was educated at the court of his uncle Richard I., king of England, under whose leadership he gained valuable experience in war, being appointed duke of Aquitaine, count of Poitou and ere. of York. Soon after, when emperor Henry VI. died in September 1197, one of the princes under the leadership of Adolph, archbishop of Cologne, were anxious to find a rival to Philip, duke of Swabia, who had been elected German king. After some delay his choice fell upon Otto, who was chosen king at Cologne on the 9th of June 1198. Hostilities broke out at once, and Otto, who drew his main support from his hereditary possessions in the Rhineland and Saxony, seized Aix-la-Chapelle, and was crowned there on the 12th of July 1198. The earlier course of the war was unfavourable to Otto, whose position was weakened by the death of Richard of England in April 1199; but his cause began to improve when Pope Innocent III. declared for him and placed his rival under the ban in April 1201. This support was purchased by a capitulation signed by Otto at Neuss, which ratified the independence and decided the boundaries of the States of the Church, and was the first authentic basis for the practical authority of the pope in central Italy. In 1200 an attack made by Philip on Brunswick was beaten off, the city of Worms was taken, and subsequently the aid of Ottokar I., king of Bohemia, was won for Otto. The papal legate Guido worked energetically on his behalf, several princes were persuaded to desert Philip and by the end of 1203 his success seemed assured. But after a period of reverses, Otto was wounded during a fight in July 1206 and compelled to take refuge in Cologne. Retiring to Denmark, he obtained military assistance from King Waldemar II., and a visit to England procured monetary aid from King John, after which he managed to maintain his position in Brunswick. Preparations were made to drive him from his last refuge, when he was saved by the murder of Philip in June 1208. Many of the supporters of Philip now made overtures to Otto, and an attempt to set up Henry I., duke of Brabant having failed, Otto submitted to a fresh election and was chosen German king at Frankfort on the 11th of November 1208 in the presence of a large gathering of the dukes. A general reconciliation followed, which was assisted by the betrothal of Otto to Philip's eldest daughter Beatrice, but as she was only ten years old, the marriage was deferred until the 22nd of July 1212. The pope who had previously recognized the victorious Philip, hastened return to the side of Otto; the capitulation of Neuss was renewed and large concessions were made to the church.

In August 1209 the king set out for Italy. Meeting with no opposition, he was received at Viterbo by Innocent, but refused the papal demand that he should concede to the church all the territories which, previous to 1197, had been in dispute between the Empire and the Papacy, consenting, however, not to claim supremacy over Sicily. He was crowned emperor at Rome on the 4th of October 1209, a ceremony which was followed by fighting between the Romans and the German soldiers. The pope then requested the emperor to leave Roman territory; but he remained near Rome for some days, demanding satisfaction for the losses suffered by his troops. The breach with Innocent soon widened, and in violation of the treaty made with the pope Otto attempted to recover for the Empire all the property which Innocent had annexed to the Church, and rewarded his supporters with large estates in the disputed territories. Having occupied Tuscany he marched into Apulia, part of the kingdom of Frederick of Hohenstaufen, afterwards the emperor Frederick II., and on the 18th of November 1210 was excommunicated by the pope. Regardless of this sentence Otto completed the conquest of southern Italy, but the efforts of Innocent had succeeded in arousing considerable opposition in Germany, where the rebels were also supported by Philip Augustus, king of France. A number of princes assembled at Nuremberg declared Otto deposed, and invited Frederick to fill the vacant throne. Returning to Germany in March 1212, Otto made some headway against his enemies until the arrival of Frederick towards the close of the year. The death of his wife in August 1212 had weakened his hold on the southern dukies, and he was soon confined to the district of the lower Rhine, although supported by money from his uncle King John of England. The final blow to his fortunes came when he was decisively defeated by the French at Bouvines in July 1214. He escaped with difficulty from the fight and took refuge in Cologne. His former supporters hastened to recognize Frederick; and in 1216 he left Cologne for Brunswick, which he had received in 1202 by arrangement with his older brother Henry. The conquest of Hamburg by the Danes, and the death of John of England, were further blows to his cause. On the 10th of May 1218 he died at the Harzburg after being looted from the ban by a Cistercian monk, and was buried in the church of St Blasius at Brunswick. He married for his second wife in May 1214 Marie, daughter of Henry I., duke of Brabant, but left no children.

**Otto of Freising** (c. 1114-1139), German bishop and chronicler, was the successor of Heinrich of Lorsch, abbot of Hirsau, by his daughter Agnes, daughter of the emperor Henry IV. By her first husband, Frederick I. of Hohenstaufen, duke of Swabia, Agnes was the mother of the German king Conrad III., and grandmother of the emperor Frederick I; and Otto was thus related to the most powerful families in Germany. The notices of his life are scanty and the dates somewhat uncertain. He studied in Paris, where he took an especial interest in philosophy, is said to have been one of the first to introduce the philosophy of Aristotle into Germany, and he served as provost of a new foundation in Austria. Having entered the Cistercian order, Otto became abbot of the Cistercian monastery of Morimond in Burgundy about 1136, and soon afterwards was elected bishop of Freising. This diocese, and indeed the whole of Bavaria, was then disturbed by the feud between the Welfs and the Hohenstaufen, and the church was in a deplorable condition; but a great improvement was brought about by the new bishop in both ecclesiastical and secular matters. In 1147 he again in supported the money of the Cistercian order led by the bishop was deposed, but Otto reached Jerusalem, and returned to Bavaria in 1148 or 1149. He enjoyed the favour of Conrad's successor, Frederick I.; was probably instrumental in settling the dispute over the duchy of Bavaria in 1156; was present at the famous diet at Beangon in 1157, and, still retaining the dress of a Cistercian monk, died at Morimond on the 22nd of September 1158. In 1157 a statue of the bishop was erected at Freising.

Otto wrote a Chronicon, sometimes called De duabus civitatis, an historical and philosophical work in eight books, which follows to some extent the lines laid down by Augustine and Orosius.
Written during the time of the civil war in Germany, it contrasts Jerusalem and Babel, the heavenly and the earthly kingdoms, but also contains much valuable information about the history of the time. The chronicle, which was held in very high regard by contemporaries, goes down to 1146, and from this date until 1200 has been edited by Otto, abbot of St Blasius (d. 1225). Better known is Otto's *Gesta Friderici imperatoris*, written at the request of Frederick L, and prefixed by a letter from the emperor to the author. The *Gesta* in three books, the first two of which were written by Otto and the remnant of two or part of them, by his pupil Ragenew, or Rahewin; it has been argued that the third book and the early part of the fourth were also the work of Otto. Beginning with the quarter between Pope Gregory VII. and the emperor Henry IV., the first book opens with the history down to the death of Conrad III. in 1152. It is not confined to German affairs, as the author digresses to tell of the preaching of Bernard of Clairvaux, of his zeal against the heretics, and of the condemnation of Abbe Abbot of Hirsau, in philosophy and theology. The second book opens with the election of Frederick I. in 1152, and deals with the history of the first five years of his reign, especially in Italy, in some detail. From this point (1156) the work is continued by Ragenew. Otto's Latin is excellent, and in spite of a slight partiality for the Hohenstaufen, and some minor inaccuracies, the *Gesta* has been rightly described as a "model of historical composition." First printed by John Cuspinian at Strassburg in 1515, Otto's writings are now found in the *Monumenta Germaniae historica*, Band xx. (Hanover, 1868), and have been translated into German by H. Kohl (Leipzig, 1881-1886). The *Gesta Friderici* has been published separately with introduction by G. Waiz. Otto is also said to have written "*Gesta Regum Dei*" in the history of the Papal States and the Papal court, and his efforts on this work were renewed by his pupil Potthast, *Bibliotheca historica* (Berlin, 1896). A. W. H.

**OTTO OF NORDHEIM** (d. 1083), duke of Bavaria, belonged to the rich and influential Saxon family of the counts of Nordheim, and having distinguished himself in war and peace alike, received the duchy of Bavaria from Agnes, widow of the emperor Henry III., in 1061. In 1062 he assisted Anno, archbishop of Cologne, to seize the person of the German king, Henry IV.; led a successful expedition into Hungary in 1063; and took a prominent part in the government during the king's minority. In 1064 he went to Italy to settle a papal schism, was largely instrumental in securing the banishment from court of Adalbert, archbishop of Bremen, and crossed the Alps in the royal interests on two other occasions. He neglected his duchy, but added to his personal possessions, and in 1066 shared in the Pechell anti-german elections. From 1070 onwards he was accused by a certain Egino of being privy to a plot to murder the king, and it was decided he should submit to the ordeal of battle with his accuser. The duke asked for a safe-conduct to and from the place of meeting, and when this was refused he declined to appear, and was consequently deprived of Bavaria, while his Saxon estates were plundered. He obtained no support in Bavaria, but raised an army among the Saxons and carried on a campaign of plunder against Henry until 1071, when he submitted; in the following year he received back his private estates. When the Saxons revolt broke out in 1073 Otto is represented by Bruno, the author of *De bello Saxonic*o, as delivering an inspiring speech to the assembled Saxons at Wormsleben, after which he took command of the insurgents. By the peace of Gerstungen in 1074 Bavaria was restored to him; he shared in the Saxon rising of 1075, after which he was again pardoned and made administrator of Saxony. After the excommunication of Henry IV. in 1076 Otto attempted to mediate between Henry and the Saxons, but when these efforts failed he again placed himself at their head. He went to the disavowal of the Rhine and the lower Rhine, by his duchy of Holstein, which his restoration to Bavaria was assured, and by his skill and bravery inflicted defeats on Henry's forces at Mellrichstadt, Flarichheim and Hohenmölsen. He remained in arms against the king until his death on the 11th of January 1083. Otto is described as a noble, prudent and warlike man, and he possessed great abilities. His repeated pardon showed that Henry could not afford to neglect such a powerful personality, and his military talents were repeatedly displayed. By his wife Richenda, widow of Hermann, count of Werla, he left three sons and three daughters.

**OTTOMAN**, a form of couch which only has a head but no back, though sometimes it has neither. It may have square or semicircular ends, and as a rule it is what upholsterers call "stuffed over"—that is to say no wood is visible. It belongs to the same order of ideas as the divan (q.v.); its name betokens its Oriental origin. It was one of the luxurious appointments which Europe imported from the East in the 18th century; the first mention that has been found of it is in France in 1720. In the course of a generation it made its way into every boudoir, but it appears originally to have been much larger than at present. The word is also applied to a small foot-stool covered with carpet, embroidery or beadwork.

**OTTOMWA**, a city and the county-seat of Wapello county, Iowa, U.S.A., on both sides of the Des Moines river, in the S.E. part of the state, about 85 m. S.E. of Des Moines. Pop. (1900) 18,197, of whom 1759 were foreign-born; (1910 census) 22,012. It is served by the Chicago, Burlington & Quincy, the Chicago, Milwaukee & Saint Paul, the Chicago, Rock Island & Pacific, and the Wabash railways. The site on which it is built took its name from the farms a succession of terraces running down from the river. In the city are a Carnegie library, a city hospital and St Joseph's Academy. Ottumwa is the headquarters of the Ottumwa Division of the Southern Federal Judicial District of Iowa, and terms of United States District and Circuit courts are held there. The city is one of the richest coal regions of the state, and ranks high as a manufacturing centre, pork-packing, and the manufacture of iron and steel, machinery and agricultural and mining implements being the leading industries. The value of the factory product in 1905 was $10,374,183, an increase of 19.5% since 1900. Ottumwa was first settled in 1843, was incorporated as a town in 1851, and first chartered as a city in 1857.

**OTWAY, THOMAS** (1652-1685), English dramatist, was born at Trotton, near Midhurst, Sussex, on the 3rd of March 1652. His father, Humphrey Otway, was at that time curate of Trotton, but Otway's childhood was spent at Woolbeding, a parish 3 m. distant, of which his father had become rector. He was educated at the grammar school at Chichester and at Trinity College, in 1669 entered Christ Church, Oxford, as a commoner but left the university in the autumn of 1672. At Oxford he made the acquaintance of Anthony Cary, 5th viscount Falkland, through whom, he says in the dedication to *Caius Marius*, he first learned to love books. In London he made acquaintance with Mrs Aphra Behn, who in 1672 cast him for the part of the old king in her *Forc'd Marriage*, or *The Jealous Bridegroom*, at the Dorset Garden Theatre, but he had a bad attack of stage fright, and never made a second appearance. In 1675 Thomas Betterton produced at the same theatre Otway's first dramatic attempt, *Alcibiades*, which was printed in the same year. It is a poor tragedy, written in heroic verse, but was saved from absolute failure by the actors. Mrs Barry took the part of Draxilla, and her lover, the earl of Rochester, recommended the author of the piece to the notice of the duke of York. He made a great advance on this first work in *Don Carlos, Prince of Spain* (licensed June 15, 1676; an unacted edition probably belongs to the same year). The material for this rhyed tragedy Otway took from the novel of the same name, written in 1672 by the Abbé de Saint-Réal, in 1673 published in Paris under the title of *Bienheureux Charles*, and also dramatized by Betterton under the title of *Don Carlos*. In it the two characters familiar throughout his plays make their appearance. Don Carlos is the impetuous, unstable youth, who seems to be drawn from Otway himself, while the queen's part is the gentle pathetic character repeated in his more celebrated heroines, Momimia and Belvidera. "It got more money," says John Downes (*Roscuis Anglicanus*, 1708) of this play, "than any preceding modern tragedy." In 1677 Betterton produced two adaptations from the French by Otway, *Thiès and Berenice* (from Racine's *Bérénice*), and the *Cheats of Scapin* (from Molière's *Fourberies de Scapin*). These were printed...
OUBLIETTE—OUDENARDE

377

Duc (Dict. de l'architecture) gives a diagram of such an oublieette at the castle of Pierrefonds, France. Many so-called "oublies" in medieval castles were probably outlets for the disposal of drainage, refuse, &c., which at times may have served for the getting rid of prisoners.

OUCH, a brooch, clasp or buckle, especially one ornamented with jewels, enamels, &c., and used to clasp a cope or other ecclesiastical vestment. It is also used, as in Exod. xxxix. 6, of the gold or silver setting of jewels. The word is an example of the misdivision of a substantive and the indefinite article, being properly "nouche," "a nouche" being divided into "an ouche," as a napron into an apron, a nadder into an adder, and, reversely, an ewt, i.e. eft, into a newt. "Nouche" was adapted into O. Fr., whence English took the word, from the Late Lat. nusca, brooch; probably the original is Celtic, cf. O. Irish nasca, ring, nasgaism, fasten.

OUDENARDE (Flemish Oudenaarde), a town of Belgium in the province of East Flanders, 18 m. S. of Ghent. Pop. (1904) 6572. While it is best known for the great victory gained by Marlborough and Eugene over the French under Vendôme in 1708, Oudenaarde has many features of interest. The town hall, which took ten years to build (1552-1563), has after that of Louvain the largest elaborately decorated facade in Belgium. It was designed by H. van Paecke, a Master of Arch. in the Gothic style. The belfry tower of five storeys with three terraces, surmounted by a golden figure, is a striking feature. The council chamber contains a fine oak door and Gothic chimneypiece, both c. 1530. There are also two interesting old churches, St. Walburga, partly of the 12th and partly of the 14th century, and Notre Dame, dating from the 13th century. The former contains several fine pictures by Craweyer and other old Flemish masters. The Battle of Oudenarde (June 30th-July 1st 1708) was fought on the ground north-west and north of the town, which was then regularly fortified and was garrisoned by a force of the Allies. The French army under the duke of Burgundy and Marshal Vendôme, after an abortive attempt to invest Oudenaarde, took up a defensive position north of the town when Marlborough and Eugene, after a forced march, arrived with the main Allied army. The advanced guard of the Allies under General (Lord) Cadogan promptly crossed the Scheldt and annihilated an outlying body of French troops, and Cadogan established himself on the ground he has won in front of the French centre. But the Allied main army took a long time to deploy. The Scheldt was then frozen over, and could form up (on the left of Cadogan's detachment) only slowly and by degrees. Observing this, Burgundy resolved to thrust forward his right towards Oudenaarde to engage and hold the main body of the Allies before their line of battle could be formed. This effect, it was hoped that the remainder of the French army could isolate and destroy Cadogan's detachment, which was already closely engaged with the French centre. But he miscalculated both the endurance of Cadogan's men (amongst whom the Prussians were conspicuous for their tenacity) and the rapidity with which in Marlborough's and Eugene's hands the wearied troops of the Allies could be made to move. Marlborough, who personally directed the operations on his left wing, not only formed his line of battle successfully, but also began seriously to press the forces that had been sent to check his deployment. Before long, while the hostile left wing still remained inactive, the unfortunate troops of the French centre and right were gradually hemmed in by the whole force of the Allies. The decisive blow was delivered by the Dutch marshal, Overkirk, who turned Cadogan's right flank with a large force (the last reserve of the Allies) to make a wide turning movement round the extreme right of the French, and at the proper time attacked them in rear. A belated attempt of the French left to intervene was checked by the British cavalry, and the pressure on the centre and right, which were now practically surrounded, continued even after nightfall. A few scattered units managed to escape, and the left wing retreated unmolested, but at the cost of about 3000 casualties the Allies inflicted a loss of 6000 killed and wounded and 9000 prisoners on the enemy, who were,
moreover, so shaken that they never recovered their confidence to the end of the campaign. The battle of Oudenaarde was not the greatest of Marlborough's victories, but it affords almost the best illustration of his military character. Contrary to all the rules of war then in vogue, he fought a piecemeal and unpremeditated battle, with his back to a river, and with wearied troops, and the event justified him. An ordinary commander would have avoided fighting altogether, but Marlborough saw beyond the material conditions and risked all on his estimate of the moral superiority of his army and of the weakness of the French leading. His conduct of the battle, once it had opened, was a model of the "partial" victory—the destruction of a part of the enemy's forces under the eyes of the rest—which was in the 17th and 18th centuries the tactician's ideal, and was sufficient to ensure him the reputation of being the best general of his age. But it is in virtue of having fought at all that he passes beyond the criteria of the time and becomes one of the great captains of history.

**OUDINÉ, EGÉNE ANDRÉ** (1810–1887), French sculptor and medallist, was born in Paris in 1810, and devoted himself from the beginning to the medallist's branch of sculpture, although he also excelled in monumental sculpture and portrait busts. Having carried off the grand prize for medal engraving in 1831, he had a sensational success with his "Wounded Gladiator," which he exhibited in the same year. He subsequently occupied official posts as designer, first, to the Inland Revenue Office, and then to the Mint. Among his most famous medals are that struck in commemoration of the annexation of Savoy by France, and that on the occasion of the peace of Villafranca. Other remarkable pieces are "The Apotheosis of Napoleon I.,” “The Amnesty,” “Le Duc d'Orléans,” “Bertheot,” “The Universal Exposition,” “The Second of December, 1851,” “The Establishment of the Republic,” “The Battle of Inkermann,” and "Napoleon's Tomb at the Invalides." For the Hotel de Ville in Paris he executed fourteen bas-reliefs, which were destroyed in 1871. Of his monumental works, many are to be seen in public places in and near Paris. In the Tuileries gardens is his group of "Daphnis and Hebe"; in the Luxembourg gardens the "Queen Bertha"; at the Louvre the "Buffon"; and in the courtyard of the same palace the "Bathsheba." A monument to General Espagne is at the Invalides, and a King Louis VIII. at Versailles. Oudiné, who may be considered the father of the modern medal, died in Paris in 1887.

**OUDINOT, CHARLES NICOLAS** (1769–1847), duke of Reggio, marshal of France, came of a bourgeois family in Lorraine, and was born at Bar-le-Duc on the 24th of April 1767. He had a passion for a military career, and served in the regiment of Médoc from 1784 to 1787, when, having no hope of promotion on account of his non-noble birth, he retired with the rank of sergeant. The Revolution changed his fortunes, and in 1792, on the outbreak of war, he was elected lieutenant-colonel of the 3rd battalion of the volunteers of the Meuse. His gallant defence of the little fort of Bitsch in the Vosges in 1792 drew attention to him; he was transferred to the regular army in November 1793, and after serving in numerous actions on the Belgian frontier he was promoted general of brigade in June 1794 for his conduct at the battle of Kaiserslautern. He continued to serve with the greatest distinction on the German frontier under Hoche, Pichegru and Moreau, and was repeatedly wounded and once (in 1795) made prisoner. He was Masséna's right hand all through the great Swiss campaign of 1799—first as a general of division, to which grade he was promoted in April, and then as chief of the staff—and was extraordinary distinguished at the battle of Dennewitz. He was present under Masséna at the defence of Genoa, and so distinguished himself at the combat of Monza that Napoleon presented him with a sword of honour. He was made inspector-general of infantry, and, on the establishment of the empire, given the Grand Cross of the Legion of Honour, but was not included in the first creation of marshals. He was at this time elected a member of the chamber of deputies, but he had little time to devote to politics. He took a conspicuous part in the war of 1805 in command of the famous division of the "générals Oudinot," formed of picked troops and organized by him, with which he seized the Vienna bridges, received a wound at Hollabrunn, and delivered the decisive blow at Austerlitz. In 1806 he won the battle of Ostrołęka, and fought with resolution and success at Friedland. In 1808 he was made governor of Erfurt and count of the Empire, and in 1809, after displaying brilliant courage at Wagram, he was promoted to the rank of marshal. He was made duke of Reggio, and received a large money grant, but in April 1810, Oudinot administered the government of Holland from 1810 to 1812, and commanded the II. corps of the Grande Armée in the Russian campaign. He was present at Lützen and Bautzen, and when holding the independent command of the corps directed to take Berlin was defeated at Gross Beeren (see Napoleonic Campaigns). He was then superseded by Ney, but the miscarriage was too great to be repaired, and Ney was defeated at Dennewitz. Oudinot was not disgraced, however, holding important commands at Leipzig and in the campaign of 1814. On the abdication of Napoleon he rallied to the new government, and was made a peer by Louis XVIII., and, unlike many of his old comrades, he did not desert to his old master in 1815. His last active service was in the French invasion of Spain in 1823, in which he commanded a corps and was for a time governor of Madrid. He died as governor of the Invalids on the 13th of September 1847. Oudinot was not, and made no pretence of being, a great commander, but he was a great general of division. He was the beau-ideal of an infantry general, energetic, thoroughly conversant with detail, and in battle as resolute and skilful as any of the marshals of Napoleon.

Oudinot's eldest son, CHARLES NICOLAS VICTOR, 2nd duke of Reggio (1791–1863), lieutenant-general, served through the later campaigns of Napoleon from 1809 to 1814, being in the latter year promoted major for gallant conduct. Unlike his father he was a cavalryman, and as such held command of the cavalry school at Saumur (1822–1830), and the inspector-general of cavalry (1836–1848). He is chiefly known as the commander of the French expedition which besieged and took Rome in 1849 and re-established the temporal power of the pope. After the coup d'état of the 2nd of December 1851, in resistance to which he took a prominent part, he retired from military and political life, dying at Paris on the 7th of June 1863.

The 2nd duke wrote *Aperçu historique sur la dignité de maréchal de France* (1813) and *L'Archduque Ferdinand de Saint Louis, etc.* (1833): "L'Emploi des troupes aux grands travaux d'utilité publique (1839); De la Cavalerie et du casernement des troupes à cheval (1830); Des Romontes de l'armée (1849); and a brief account of his Italian operations of 1849.

**OUGHTRED, WILLIAM** (fl. 1575–1660), English mathematician, was born at Eton, and educated there and at King's College, Cambridge, of which he became fellow. Being admitted to holy orders, he left the university about 1603, and was presented to the rectory of Aldbury, near Guildford in Surrey; and about 1628 he was appointed by the earl of Arundel to instruct his son in mathematics. He corresponded with some of the most eminent scholars of his time on mathematical subjects; and his house was generally full of pupils from all quarters. It is said that he expired in a sudden transport of joy upon hearing the news of the vote at Westminster for the restoration of Charles II.

He published, among other mathematical works, *Clavis Mathematicae*, in 1634, in which he introduced new signs for certain mathematical operations (see Algebra); a treatise on navigation entitled *Circles of Proportion*, in 1672; works on trigonometry and dialling, and his *Opuscula Mathematica*, published posthumously in 1676. Oughtred died in 1660. The first English printer to pronounce "Louisa"—of Maria Louise [de la] Ramée (1809–1898), English novelist, born at Bury St Edmunds, where her birth was registered on the 7th of January 1839. Her father, Louis Ramée, was French, and her mother, Susan Sutton, English. At an early age she went to live in London, and there began to contribute to the *New Monthly* and *Bentley's Magazine*. In 1860 her first story, afterwards republished as *Held in Bondage* (1863), appeared in the *New Monthly* under the title of *Gravelle de Vigne*, and this was followed in quick succession by *Strathmore*.
(1865), Chandos (1869) and Under Two Flags (1867). The list of Ouida’s subsequent works is a very long one; but it is sufficient to say that, together with Molks (1880), those already named are not only the most characteristic, but also the best. In a less dramatic genre, her Bimbi: Stories for Children (1882) may also be mentioned; but it was by her more flamboyant stories, such as Under Two Flags and Molks, that her popular success was achieved. By purely literary critics and on grounds of morality or taste Ouida’s novels may be condemned. They are generally flashy, and frequently unwholesome. It is impossible, however, to dismiss books like Chandos and Under Two Flags merely on such grounds. The emphasis given by Ouida to motives of sensual passion was combined in her with an original gift for situation and plot, and also with genuine descriptive powers which, though disfigured by inaccurate observation, literary solecisms and tawdry extravagance, enabled her at her best to construct a picturesque and powerful story. The character of “Cigarette” in Under Two Flags is full of fine touches, and this is not an isolated instance. In 1874 Ouida made her home in Florence, and many of her later novels have an Italian setting. She contributed from time to time to the Hesperid and other similar periodicals, and was the author of a number of short stories, and an essay on the judicial and political subjects were marked by characteristic violence and lack of judgment. She had made a great deal of money by her earlier books, but had spent it without thought for the morrow; and though in 1907 she was awarded a Civil List pension, she died at Viareggio in poverty on the 25th of January 1908.

OUNCE. (1) (Through O. Fr. once, modern once, from Lat. uncia, twelfth part, of weight, of a pound, of measure, of a foot, in which sense it gives the O.Eng. ynce, inch), a unit of weight, being the twelfth part of a pound troy, $=480$ grains; in avoirdupois $=437.5$ grains, $\frac{1}{12}$ of a pound. The fluid ounce is a measure of capacity; in the United Kingdom it is equivalent to an avoirdupois ounce of distilled water at $62^\circ$ F.; in the United States of America it is the 128th part of the gallon, $=\frac{1}{12}$ of a gallon, $=0.338$ of a litre of distilled water at its maximum density (see Weights and Measures). (2) A name properly applied to the Felis uncia or snow leopard (q.e.). It appears to have been originally used of various species of lynx, and is still sometimes the name of the Canada lynx. The word appears in O. Fr. once and it represents the base of the modern French lince, and it is usually explained as being due to the confusion of the $l$ with the article, lonce and lonsa being changed to l’once or l’onsa, and the $l$ subsequently dropped. If this be so the word is the same as “lynx,” from the popular Lat. luncia= lynxia, Gr. λύκες. On the other hand once and omsa may be nasalized forms of yôsa, the Persian name of the panther.

OUNDLE, a market-town in the Northern parliamentary division of Northamptonshire, England, 306 m. N.E. of Northampton by a branch of the London & North-Western railway. Pop. of urban district (1901) 2404. It is picturesquely situated on an eminence, two sides of which are touched by the river Nene, which here makes a deep bend. The church of St Peter is a fine building with Early English, Decorated and Perpendicular porticos, with a western tower and lofty spire. Oundle School, one of the English public schools, was founded under the will of Sir William Laxton, Lord Mayor of London (d. 1536). There are about 200 boys. The school is divided into classical and modern sides, and has exhibits to Oxford and Cambridge universities. A second-grade school was instituted out of the foundation in 1878. Oundle has a considerable agricultural trade.

Wilfrid, archbishop of York, is said to have been buried in 711 at a monastery in Oundle (Undele) which appears to have been destroyed shortly afterwards, and was certainly not in existence at the time of the Conquest. The manor, with a market and tolls, was among the possessions confirmed in 972 by King Edgar to the abbey of Peterborough, to whom it still belonged in 1086. The market was then worth 20s. yearly and is shown by the quo warranto rolls to have been held on Saturday, the day being changed to Thursday in 1835. After the Dissolu-

tion the market was granted with the manor to John, earl of Bedford, and still belongs to the lord of the manor. The abbey of Peterborough about the 13th century confirmed to his men of Oundle freedom from tallage, "saving to himself pleas of portmannoot and all customs pertaining to the market," and they agreed to pay 8 marks, 12s. 11d., yearly for their privileges. The town was evidently governed by bailiffs in 1401, when the "bailiffs and good men" received a grant of pontage for the repair of the bridge called "Asseconbridge," but the town was never incorporated and never sent members to parliament.

Ouro Preto ("Black Gold"), a city of the state of Minas Geraes, Brazil, 336 m. by rail N. by W. of Rio de Janeiro, and about 300 m. W. of Victoria, Espírito Santo, on the eastern slope of the Serra de Espinhaco and within the drainage basin of the Rio Doce. Pop. (1890) 17,860; (1900) 11,116. Ouro Preto is connected with Miguel Burnier, on the Central of Brazil railway, by a metre-gauge line 31 m. in length. The city is built upon the lower slope of the Serra do Ouro Preto, a spur of the Espinhaco, deeply cut by ravines and divided into a number of irregular hills, up which the narrow, crooked streets are built and upon which groups of low, old-fashioned houses form each a separate cluster. From a mining settlement the city grew as the inequalities of the site permitted. R. R. T. (The Highlands of Brazil, London, 1860) says that its shape "is that of a huge serpent, whose biggest end is about the Praça. . . the extremities stretch two good miles, with raised convolutions. . . . The 'streeting' of both upper and lower town is very tangled, and the old thoroughfares, mere 'wynds' . . . show how valuable once was building ground." The rough streets are too steep for vehicles, and even riding on horseback is often difficult. Several rivulets follow the ravines and drain into the Ribeira do Carmo, a sub-tributary of the Rio Doce. The climate is sub-tropical and humid, though the elevation (3700-3800 ft.) gives a temperate climate in winter. The days are usually hot and the nights cold, the variations in temperature being a fruitful cause of bronchial and pulmonary diseases. Ouro Preto has several historic buildings; they are of antiquated appearance and built of the simplest materials—broken stone and mortar, with an exterior covering of plaster. The more noteworthy are the old government house (now occupied by the bishop and episcopal curias), the legislative chambers, municipal hall and jail—all fronting on the Praça da Independência—and elsewhere the old Casa dos Contos (afterwards the public treasury), a theatre (the oldest in Brazil, restored in 1861-1862) and a hospital. There are 15 churches in the city, some occupying the most conspicuous sites on the hills, all dating from the more prosperous days of the city’s history, but all devoid of architectural taste. Ouro Preto is the seat of the best mining school in Brazil.

The city dates from 1701, when a gold-mining settlement was established in its ravines by Antonio Dias de Taubaté. The circumstance that the gold turned black on exposure to the humid air (owing to the presence of silver) gave the name of Ouro Preto to the mountain spur and the settlement. In 1711 it became a city with the name of Villa Rica, a title justified by its size and wealth. At one period of its prosperity its population was estimated at 25,000 to 30,000. In 1720 Villa Rica became the capital of the newly created captaincy of Minas Geraes, and in 1823 the capital of the province of Minas Geraes under the empire of Dom Pedro I. When the empire was overthrown in 1889, Ouro Preto was chosen as the new capital, the city being then only a mere village of 4000. With the decree of its founding, Ouro Preto became the seat of government, but its mining industries, Ouro Preto had become merely the political centre of the state. The removal of the capital was a serious blow, as the city has no industries to support its population and no trade of importance. The event most prominent in the history of the city was the conspiracy of 1780, in which several leading citizens were concerned, and for
OUSE—OUSELEY, SIR F. A. G.

which one of its less influential members, an alferes (ensign) of cavalry named Joaquim José da Silva Xavier, nicknamed “Tira-dentes” (teeth-puller), was executed in Rio de Janeiro in 1792. The conspiracy originated in a belief that the Portuguese crown was about to enforce payment of certain arrears in the mining tax known as the “royal fifths,” and its object was to set up a republic in Brazil. Although a minor figure in the conspiracy, Tira-dentes was made the scapegoat of the thirty-two men arrested and sent to Rio de Janeiro for trial, and posterity has made him the proto-martyr of republicanism in Brazil.

OUSE, the name of several English rivers.

(1) The Great Ouse rises in Northamptonshire, in the slight hills between Banbury and Brackley, and falls only about 300 ft. in a course of 160 m. (excluding lesser windings) to its mouth in the Wash (North Sea). With an easterly direction it flows past Brackley and Buckingham and then turns N.E. to Stony Stratford, where the Roman Watling Street forced it. It receives the Tove from the N.W., and the Ouelz from the S. at Newport Pagnell. It then follows an extremely sinuous course past Olney to Sharnbrook, where it turns abruptly S. to Bedford. A north-easterly direction is then resumed past St. Neots to Oundle, and Huntingdon, when the river trends easterly to St Ives. Hitherto the Ouse has watered an open fertile valley, and there are many beautiful wooded reaches between Bedford and St Ives, while the river abounds in coarse fish. Below St Ives the river debouches suddenly upon the Fens; its fall from this point to the mouth, a distance of 55 m. by the old course, is little more than 20 ft. (the extensive system of artificial drainage cuts connected with the river is considered under FENS). From Earith to Denver the waters of the Ouse flow almost wholly in two straight artificial channels called the Bedford Rivers, only a small head passing, under ordinary conditions, along the old course, called the Old West River. This is joined by the Cam from the S. 4 m. above Ely. In its northward course from this point the river receives from the E. the Lark, the Little Ouse, or Brandon river, and the Wissey. Below Denver sluice, 16 m. from the mouth, the Ouse is tidal. It flows past King’s Lynn, and enters the Wash near the S.E. corner. The river is locked up to Bedford, a distance of 74 sq. m. by the old course; in the low season it bears a considerable traffic, but above St Ives it is little used, and above St Neots’ navigation has ceased. The drainage area of the Great Ouse is 2607 sq. m.

(2) A river of Yorkshire. The river Ure, rising near the N.W. boundary of the county in the heart of the Pennines, and traversing the lovely valley famous under the name Wensleydale, unites with the river Swale to form the Ouse near the small town of Boroughbridge, which lies in the rich central plain of Yorkshire. The course of the Swale, which rises in the north of the county on the eastern flank of the Pennines, is mostly through this plain, and that of the Ouse is wholly so. It flows S.E. to York, thence for a short distance S. by W., then mainly S.E. again past Selby and Goole to the junction with the Trent; the great estuary so formed being known as the Humber. The course of the Ouse proper, thus defined, is 61 m. The Swale and Ure are each about 60 m. long. Goole is a large and growing port, and the river bears a considerable traffic up to York. There is also some traffic up to Boroughbridge, from which the Ure Navigation (partly a canal) continues up to Ripon. The Swale is not navigable. The chief tributaries are the Nidd, the Wharfe, the Don and the Aire from the W., and the Derwent from the N.E., but the detailed consideration of these involves that of the hydrography of the greater part of Yorkshire (q.v.). All, especially the western tributaries, traverse beautiful valleys, and the Aire and Don, with canals, are of importance as affording communications between the manufacturing district of south Yorkshire and the Humber ports. The Derwent is also navigable. The drainage area of the Ouse is 4133 sq. m. It is tidal up to Naburn locks, a distance of 37 m. from the junction with the Trent, and the total fall from Boroughbridge is about 45 ft.

(3) A river of Sussex, rising in the Forest Ridges between Horsham and Cuckfield, and draining an area of about 200 sq. m., mostly in the Weald. Like other streams of this locality, it breaches the South Downs, and reaches the English Channel at Newhaven after a course of 32 m. The eastward drift of beach-building material formerly diverted the mouth of this river from its present place to a point to the east near Seaford. The Ouse is navigable for small vessels to Lewes, and Newhaven is an important harbour.

OUSEL, or OUSEL, Anglo-Saxon osele, equivalent of the German Asel (a form of the word found in several old English books), apparently the ancient name for what is now more commonly known as the blackbird (q.v.), Turdus merula, but at the present day not often applied to that species, though used in a compound form for birds belonging to another genus and family.

The water-ousel, or water-crow, is now commonly named the “dipper”—a term apparently invented and bestowed in the first edition of T. Bewick’s British Birds (ii. 16, 17)—not, as is commonly supposed, from the bird’s habit of entering the water in pursuit of its prey, but because “it may be seen perched on the top of a stone in the midst of the torrent, in a continual dipping motion, or short courtesy often repeated.” The English dipper, Cinclus aquaticus, is the type of a small family, the Cinclidae, probably more nearly akin to the wrens (q.v.) than to the thrushes, and with examples throughout the more temperate portions of Europe and Asia, as well as North and South America. The dipper haunts rocky streams, into which it boldly enters, generally by deliberately wading, and then by the strenuous combing action of its wings and feet makes its way along the bottom in quest of its living prey—fresh-water molluscs and aquatic insects in their larval or mature condition. Complaints of its attacks on the spawn of fish have not been justified by examination of the stomachs of captured specimens. Short and squat of stature, active and restless in its movements, dusky above, with a pure white throat and upper part of the breast, to which succeeds a broad band of dark bay, it is a familiar figure to most fishermen on the streams it frequents. The water-ousel’s nest is a very curious structure—outwardly resembling a wren’s, but built on a wholly different principle—an ordinary cup-shaped nest of grass lined with dead leaves, placed in some convenient niche, but encased with moss so as to form a large mass that covers it completely except a small hole for the bird’s passage. The eggs laid within are from four to seven in number, and are of a pure white. The young are able to swim before they are fully fledged.

OUSELEY, SIR FREDERICK ARTHUR GORE (1825-1889), English composer, was the son of Sir Gore Ouseley, ambassador to Persia, and nephew to Sir William Ouseley, the Oriental scholar. He was born on the 12th of August 1825 in London, and manifested an extraordinary precocity in music, composing an opera at the age of eight years. In 1844, having succeeded to the baronetcy, he entered at Christ Church, and graduated B.A. in 1846 and M.A. in 1849. He was ordained in the latter year, and, as curate of St Paul’s, Knightsbridge, served the parish of St Barnabas, Pimlico, until 1851. In 1850 he took the degree of Mus.B. at Oxford, and four years afterwards that of Mus.D., his exercise being the oratorio St Polyaerp. In 1855 he succeeded Sir Henry Bishop as professor of music in the University of Oxford, was ordained priest and appointed precentor of Hereford. In 1856 he became vicar of St Michael’s, Tenbury, and warden
of St Michael's College, which under him became an important educational institution both in music and general subjects. His works include a second oratorio, The Harp (Hereford, 1872), a great number of services and anthems, chamber music, songs, &c., and theoretical works of great importance, such as Harmony (1868) and Counterpoint (1880) and Musical Form (1875). One of his most useful works is a series of chapters on English music added to the translation of Emil Naumann's History of Music, the subject having been practically ignored in the German treatise.

A profoundly learned musician, and a man of great general culture, Ouseley's influence on younger men was wholly for good, and he helped forward the cause of musical progress in England perhaps more effectually than if he himself had been among the more enthusiastic supporters of "advanced" music. The work by which he is best known, St Polycarp, shows, like most compositions of its date, the strong influence of Mendelssohn, at least in its plan and scope; but if Ouseley had little individuality of expression, his models in other works were the English church writers of the noblest school. He died at Hereford on the 6th of April 1880.

Ousleye, Sir William (1769-1842), British Orientalist, eldest son of Captain Ralph Ousleye, of an old Irish family, was born in Monmouthshire. After a private education he went to Paris, in 1787, to learn French, and there laid the foundation of his interest in Persian literature. In 1788 he became a cornet in the 8th regiment of dragoons.

At the end of 1794 he sold his commission and went to Leiden to study Persian. In 1795 he published Persian Miscellanies; in 1797-1799, Oriental Collections; in 1799, Epitome of the Ancient History of Persia; in 1800, The Oriental Geography of Elh Haoul; and in 1801, a translation of the Bakhthiyar Name and Observations on Some Medals and Gems. He received the degree of LL.D. from the university of Dublin in 1797, and in 1800 he was knighted. When his brother, Sir Gore Ouseleye, was sent, in 1810, as ambassador to Persia, Sir William accompanied him as secretary. He returned to England in 1813, and in 1819-1823 published, in three volumes, Travels in Various Countries of the East, especially Persia, in 1810, 1811 and 1812. He also published editions of the Travels and Arrian Proverbs of Burckhardt. He contributed a number of important papers to the Transactions of the Royal Society of Literature. He died at Boulogne in September 1842.

Ouster (from Anglo-Fr. ouster, to remove, take away, O. Fr. oster, mod. Fr. oter, Eng. "oust," to eject; exclude; the derivation is not known; Lat. ostare, to stand in the way of, resist, would give the form but does not suit the sense; a more probable suggestion connects with a supposed haustare, from haurire, to draw water; cf. "exhaust"), a legal term signifying dispossession, especially the wrong or injury suffered by a person dispossessed of freeholds or chattels real. The wrong-doer by getting into occupation forces the real owner to take legal steps to regain his rights. Ouster of the freehold may be effected by abatement; i.e. by entry on the death of the person seized before the entry of the heir, or devisee, by intrusion, entry after the death of the tenant for life before the entry of the reverseor or remainderman, by disseisin, the forcible or fraudulent expulsion of the occupier or person seized of the property. Ouster of chattels is where the owner is turned out by force or fraud of the legal proprietor before his estate is determined. In feudal law, the term ouster-le-main (Lat. amovere manum, to take away the hand) was applied to a writ or judgment granting the livery of land out of the sovereign's hand on the plea that he has no title to it, and also to the delivery by a guardian of land to a ward on his coming of age.

Outlawry, the process of putting a person out of the protection of the law; a punishment for contemptuously refusing to appear when called in court, or evading justice by disappearing. It was an offence of very early existence in England, and was the punishment of those who could not pay the mere or blood-money to the relatives of the deceased. By the Saxon law, an outlaw, or laughsiaman, lost his libera lex and had no protection from the frank-pledge in the decernancy in which he was sworn. He was, too, a frendesman, because he forfeited his friends; for if any of them rendered him any assistance, they became liable to the same punishment. He was, at one time, said to be caput lupinum, or to have a wolf's head, from the fact that he might be knocked on the head like a wolf by any one that should meet him; but so early as the time of Bacton an outlaw might only be killed if he defended himself or ran away; once taken, his life was in the king's hands, and any one killing him had to answer for it as for any other homicide. The party guilty of outlawry suffered forfeiture of chattels in all cases, and in cases of treason or murder forfeiture of real property: for other offences the profits of land during his lifetime. In cases of treason or felony, outlawry was followed also by corruption of blood. An outlaw was civiliter mortuus. He could not sue in any court, nor had he any legal rights which could be enforced, but he was personally liable upon all causes of action. An outlaw might be reversed by proceedings in error, or by application to a court. It was finally abolished in civil proceedings in 1879, while in criminal proceedings it has practically become obsolete, being unnecessary through the general adoption of extradition treaties. A woman was said to be suesed rather than outlawed.

Outram, Sir James (1803-1863), English general, and one of the heroes of the Indian Mutiny, was the son of Benjamin Outram of Butterley Hall, Derbyshire, civil engineer, and was born on the 20th of January 1803. His father died in 1805, and his mother, a daughter of Dr James Anderson, the Scottish writer on agriculture, removed in 1810 to Abergenneshire. From Udney school the boy went in 1818 to the Marischal College, Aberdeen; and in 1819 an Indian cadetship was given him. Some Scottish outlawry of 1820 enabled him to help his remarkable energy attracted notice, and in July 1820 he became acting adjutant to the first battalion of the 12th regiment on its embodiment at Poona, an experience which he found to be of immense advantage to him in his after career. In 1825 he was sent to Khandesh, where he trained a light infantry corps, formed of the wild robber Bhils, gaining over them a marvellous personal influence, and employing them with great success in checking outrages and plunder. Their loyalty to him had its principal source in their boundless admiration of his hunting achievements, which in cool daring and hairbreadth escapes have perhaps never been equalled. Originally a "puny lad," and for many years after his arrival in India subject to constant attacks of sickness, Outram seemed to win strength by every new illness, acquiring a constitution of iron, "nerves of steel, shoulders and muscles worthy of a six-foot Highlander." In 1835 he was sent to Gujarat to make a report on the Mahi Kantha district, and for some time he remained there as political agent. On the outbreak of the first Afghan War in 1838 he was appointed extra aide-de-camp on the staff of Sir John Keane, and besides many other brilliant deeds performed an extraordinary exploit in capturing a banner of the enemy before Ghazni. After conducting various raids against Afghan tribes, he was in 1839 promoted major, and appointed political agent in Lower Sind, and later in Upper Sind. Here he strongly opposed the policy of his superior, Sir Charles Napier, which led to the annexation of Sind. But when war broke out he heroically defended the residency at Hyderabad against 8000 Baluchis; and it was Sir C. Napier who then described him as "the Bayard of India." On his return from a short visit to England in 1843, he was, with the rank of brevet lieutenant-colonel, appointed to a command in the Mahratta country, and in 1847 he was transferred from Satara to Baroda, where he incurred the resentment of the Bombay government by his fearless exposure of corruption.
In 1854 he was appointed resident at Lucknow, in which capacity two years later he carried out the annexation of Oudh and became the first chief commissioner of that province. Appointed in 1857, with the rank of lieutenant-general, to command an expedition against Persia, he defeated the enemy with great slaughter at Khushab, and conducted the campaign with such rapid decision that peace was shortly afterwards concluded, his services being rewarded by the grand cross of the Bath.

From Persia he was summoned in June to India, with the brief explanation—"We want all our best men here." It was said of him at this time that "a fox is a fool and a lion a coward by the side of Sir J. Outram." Immediately on his arrival in Calcutta he was appointed to command the two divisions of the Bengal army occupying the country from Calcutta to Cawnpore; and to the military control was also joined the commissionership of Oudh. Already the mutiny had assumed such proportions as to compel Havelock to fall back on Cawnpore, which he only held with difficulty, although a speedy advance was necessary to save the garrison at Lucknow. On arriving at Cawnpore with reinforcements, Outram, "in admiration of the brilliant deeds of General Havelock," conceded to him the glory of relieving Lucknow, and, waiving his rank, tendered his services to him as a volunteer. During the advance he commanded a troop of volunteer cavalry, and performed exploits of great brilliancy at Mangalwar, and in the attack at the Alambagh; and in the final conflict he led the way, charging through a very tempest of fire. The volunteer cavalry unani-
mously voted him the Victoria Cross, but he refused the choice on the ground that he was ineligible as the general under whom they served. Resuming supreme command, he then held the town till the arrival of Sir Colin Campbell, after which he conducted the evacuation of the residency so as completely to deceive the enemy. In the second capture of Lucknow, on the commander-in-chief's return, Outram was entrusted with the attack on the side of the Gumti, and afterwards, having reconnoitred the river, he advanced through the Chattar Mansil to take the residency," thus, in the words of Sir Colin Campbell, "putting the finishing stroke on the enemy." After the capture of Lucknow he was gazetted lieutenant-general. In February 1858 he received the special thanks of both houses of parliament, and in the same year the dignity of baronet with an annuity of £1000. When, on account of shattered health, he returned finally to England in 1860, a movement was set on foot to mark the sense entertained, not only of his military achievements, but of his constant exertions on behalf of the natives of India, whose "weal," in his own words, "he made his first object." The movement resulted in the presentation of a public testimonial and the erection of statues in London and Calcutta. He died on the 11th of March 1863, and was buried in Westminster Abbey, where the marble slab on his grave bears the pregnant epitaph "The Bayard of India."

See Sir F. J. Goldsmid, James Outram, a Biography (2 vols., 1880), and L. J. Trotter, The Bayard of India (1903).

OVAL. Lat. ovum, egg. In geometry, a closed curve, generally more or less an ellipse in form. The simplest oval is the ellipse; more complicated forms are repeated in the notation of analytical geometry by equations of the 4th, 6th, 8th ... degrees. Those of the 4th degree, known as bicircular quadratics, are the most important, and of these the special forms named after Descartes and Cassini are of most interest. The Cartesian ovals presented themselves in an investigation of the section of a surface which would refract rays proceeding from a point in a medium of one refractive index into a point in a medium of a different refractive index. The most convenient equation is $br\sin^2\theta = n$, where $r$ is the distances on the curve from two fixed and given points, termed the foci, and $l, m, n$ are constants. The curve is obviously symmetrical about the line joining the foci, and has the important property that the normal at any point divides the angle between the radii into segments whose sines are in the ratio $l:m$. The Cassinian oval has the equation $r^2 = a^2$, where $r$ are the radii of a point on the curve from two given foci, and $a$ is a constant. This curve is symmetrical about two perpendicular axes. It may consist of a single closed curve or of two curves, according to the value of $a$; the transition between the two types being a figure of 8, better known as Bernoulli's lemniscate (q.v.).

See Curve; also Salmon, Higher Plane Curves.

OVAR, a town of Portugal, in the district of Aveiro and at the northern extremity of the Lagoon of Aveiro (q.v.); 21 m. S. of Oporto by the Lisbon-Oporto railway. Pop. (1900) 10,462. Ovar is the centre of important fisheries and has some trade in wine and timber. It is visited by small coasting vessels which ply to and from north-west Africa. Millet, wheat and vegetables—especially onions—are the chief products of the low-lying and unhealthy region, in which Ovar is situated.

OVARIOTOMY, the operation for removal of one or of both of the female ovaries (for anatomy see REPRODUCTIVE SYSTEM). The progress of modern surgery has been conspicuously successful in this department from 1791, the date when Houston of Carlake, Lanarkshire, carried out his successful partial extirpation, progress was arrested for some time, although the Hunters (1780) indicated the practicability of the operation. In 1809 Ephraim McDowell of Kentucky, inspired by the lectures of John Bell, his teacher in Edinburgh, performed ovariotomy, and, continuing to operate with success, established the possibility of surgical interference. He was followed by others in the United States. The cases brought forward by Lizzars of Edinburgh were not sufficiently encouraging; the operation met with great opposition; and it was not until Charles Clay, Spencer Wells, Baker Brown and Thomas Keith began work that the procedure was placed on a firm basis and was regarded as justifiable. Improved methods were introduced, and surgeons vied with one another in trying to obtain good results. Eventually, by the introduction of the antiseptic system of treating wounds, this operation, formerly regarded as one of the most grave and anxious in the domain of surgery, came to be attended with a lower mortality than any of the major operations.

To give an idea of the terrible record associated with the operation in the third quarter of the 19th century, a passage may be quoted from the English translation of the Life of Pasteur: "As it was supposed that the infected air of the hospitals might be the cause of the invariable fatal results of the operation, the Assistance Publique hired an isolated house in the Avenue de Meudon, near Paris, a salubrious spot. In 1863, ten women in succession were sent to that house; the neighbouring inhabitants watched those ten patients entering the house, and a short time afterwards their ten coffins being taken away." But as time went on, the published statistics showed an increasing success in the practice of almost every operator. Spencer Wells states that in his first five years one patient in three died; in his second and third five years one in four; in his fourth five years one in five; in 1876-1877, one in ten. After the introduction of antiseptics (1878-1881) he lost only 10-9% of his operation cases, but this series showing a marked absence of septic complications. These figures have been greatly improved upon in later years, and at the present time the mortality may be taken at somewhere about 5, 7 or 9%.

Removal of the ovaries is performed when the ovaries are the seat of cystic and other morbid changes: for fibroid tumours of the womb, in which case, by operating, one hastens the menopause and causes the tumours to grow smaller; and in cases where dysmenorrhoea is annoying, in order to create life, despite the patient's resistance, is sometimes the result of severe treatment having proved ineffectual. Oophorectomy, by which is meant removal of the ovaries with the view of producing a curative effect upon some other part, was introduced in 1872 by Robert Bartley of Georgia (1829-1905). The operation is sometimes followed by loss of strength and of sexual attraction in the patient, hence strong objections have been urged against it. The patient and her friends should clearly understand the object of the operation and the results likely to be gained by it. Lastly, the ovaries are sometimes removed with the hope of checking the progress of inoperable cancer of the breast.

From the time that the operation of ovariotomy was first established as a recognized and lawful surgical procedure, there has been much discussion as to how the pedicle of the ovary, which consists of a fold of peritoneum (the broad ligament) with included blood-vessels, should be treated. Some operators were in favour of tying it with strong silk, and bringing the ends of the ligatures outside
the abdomen. Others were in favour of having a strong metal clamp upon those structures, or of searing them with the actual cautery, whilst others claimed that the best results were to be obtained by firmly tying the pedicle, cutting the ligatures short, dropping the pedicle into the abdomen and closing the wound. This last method is now almost universally adopted. (E.O.)

Ovation (Lat. ovatio), a minor form of Roman “triumph.” It was awarded either when the campaign, though victorious, had not been important enough for the higher honour; when the war was not entirely put an end to; when it had been waged with unworthy foes; or when the general was not of rank sufficient to give him the right to a triumph. The ceremonial was on the whole similar in the two cases, but in an ovation the general walked or more commonly rode on horseback, wore a simple mantle and a long tunic, and carried no sceptre and wore a wreath of myrtle instead of laurel. Instead of a bull, a sheep was sacrificed at the conclusion of the ceremony. The word is not, however, derived from ovus, sheep, but probably means “shouting” (cp. αἴων) as a sign of rejoicing.

Oven (O. Eng. o.vn, Ger. Ofen, cf. Gr. ἄφνος, oven), a close chamber or compartment which may be raised to a considerable temperature by heat generated either within or without it. In English the term generally refers to a chamber for baking bread and other food substances, but it is also used of certain appliances employed in manufacturing operations, as in coaling or making pottery. See Heating.

Overbeck, Johann Friedrich (1789–1860), German painter, the reviver of “Christian art” in the 19th century, was born in Lübeck on the 4th of July 1789. His ancestors for three generations had been Protestant pastors; his father was doctor of laws, poet, mystic pietist and burgomaster of Lübeck. Within a stone’s throw of the family mansion in the Königstrasse stood the gymnasium, where the uncle, doctor of theology and a voluminous writer, was the master; there the nephew became a classic scholar and received instruction in art.

The young artist left Lübeck in March 1806, and entered as student the academy of Vienna, then under the direction of F. F. Füger, a painter of some renown, but of the pseudo-classic school of the French David. Here was gained thorough knowledge, but the teachings and associations proved unendurable to the sensitive, spiritual-minded youth. Overbeck wrote to a friend that he had fallen among a vulgar set, that every noble thought was suppressed within the academy and that losing all faith in humanity he turned inwardly on himself. These words are a key to his future position and art. It seemed to him that in Vienna, and indeed throughout Europe, the pure springs of Christian art had been for centuries diverted and corrupted, and so he sought out afresh the living source, and, casting on one side his contemporaries, took for his guides the early and pre-Raphaelite painters of Italy. At the end of four years, that had grown so irreconcilable that Overbeck and his band of followers were expelled from the academy. True art, he writes, he had sought in Vienna in vain—“Oh! I was full of it; my whole fancy was possessed by Madonnas and Christs, but nowhere could I find response.” Accordingly he left for Rome, carrying his half-finished canvases “Christ’s Entry into Jerusalem,” as the charter of his creed—“I will abide by the Bible; I elect it as my standing-point.”

Overbeck in 1810 entered Rome, which became for fifty-nine years the centre of his unremitting labour. He was joined by a goodly company, including Cornelius, Wilhelm Schadow and Philip Veit, who took up their abode in the old Franciscan convent of San Isidoro on the Pincian Hill, and were known among friends and enemies by the descriptive epithets—“the Nazarets,” “the pre-Raphaelites,” “the new-old school,” “the German-Roman artists,” “the church-romantic painters,” “the German patriotic and religious painters.” Their precept was hard and honest work and holy living; they eschewed the antique as pagan, the Renaissance as false, and built up a severe revival on simple nature and on the serious art of Perugino, Pinturicchio, Francia and the young Raphael. The characteristics of the style thus educated were nobility of idea, precision and even hardness of outline, scholastic composition, with the addition of light, shade and colour, not for allurement, but chiefly for perspicuity and completion of motive. Overbeck was mentor in the movement; a fellow-labourer writes: “No one who saw him or heard him speak could question his purity of motive, his deep insight and abounding knowledge; he is a treasury of art and poetry, and a saintly man.” But the struggle was hard and poverty its reward. Helpful friends, however, came in Niebuhr, Bunsen and Frederick Schlegel. Overbeck in 1813 joined the Roman Catholic Church, and thereby he believed that his art received Christian baptism.

Faith in a mission begat enthusiasm among kindred minds, and timely commissions followed. The Prussian consul, Bartholdi, had a house on the brow of the Pincian, and he engaged Overbeck, Cornelius, Veit and Schadow to decorate a room 24 ft. square with frescos (now in the Berlin gallery) from the story of Joseph and his Brethren. The subjects which fell to the lot of Overbeck were the “Seven Years of Famine” and “Joseph sold by his Brethren.” These tentative wall-pictures, finished in 1816, produced so favourable an impression among the Italians that in the same year Prince Massimo commissioned Overbeck, Cornelius, Veit and Schnorr to cover the walls and ceilings of his garden pavilion, near St John Lateran, with frescos illustrative of Tasso, Dante and Ariosto. To Overbeck was assigned, in a room 15 ft. square, the illustration of Tasso’s Jerusalem Delivered; and of eleven compositions the largest and most noteworthy, occupying one entire wall, is the “Meeting of Godfrey de Bouillon and Peter the Hermit.” The completion of the frescos—very unequal in merit—after ten years’ delay, the overtaxed and enfeebled painter dedicated to his friend Joseph Führich. The leisure thus gained was devoted to a thoroughly congenial theme, the “Vision of St Francis,” a wall-painting 20 ft. long, figures life-size, finished in 1830, for the church of Sta Maria degli Angeli near Assisi. Overbeck and the brethren set themselves the task of recovering the neglected art of fresco and of monumental painting; they adopted the old methods, and their success led to memorable revivals throughout Europe.

Fifty years of the artist’s laborious life were given to oil and easel pictures; of which the chief, for size and import, are the following: “Christ’s Entry into Jerusalem” (1824), in the Marien Kirche, Lübeck; “Christ’s Agony in the Garden” (1833), in the great hospital, Hamburg; “Lo Sposalizio” (1836), Raczyński gallery, Berlin; the “Triumph of Religion in the Arts” (1840), in the Städel Institut, Frankfort; “Pietà” (1846), in the Marien Kirche, Lübeck; the “Incredulity of St Thomas” (1851), in the possession of Mr Beresford Hope, London; the “Assumption of the Madonna” (1852), in Cologne Cathedral; “Christ delivered from the Jews” (1858), tempera, on a ceiling in the Quirinal Palace—a commission from Pius IX., and a direct attack on the Italian temporal government, therefore now covered by a canvas adorned with Cupids. All the artist’s works are marked by religious fervour, careful and protracted study, with a dry, severe handling, and an abstemious colour.

Overbeck belongs to eclectic schools, and yet was creative; he ranks among thinkers, and his pen was hardly less busy than his pencil. He was a minor poet, an essayist and a voluminous letter-writer. His style is wordy and tedious; his art is scaled down with emotion and possessed by a somewhat morbid “subjectivity.” His pictures were didactic, and used as means of propagandas for his artistic and religious faith, and the teachings of such compositions as the “Triumph of Religion and the Sacraments” he enforced by rapturous literary effusions. His art was the issue of his life: his constant thoughts, cherished in solitude and chastened by prayer, he transposed into pictorial forms, and thus were evolved countless and much-prized drawings and cartoons, of which the most considerable are the Gospels, forty cartoons (1852); Via Crucis, fourteen water-colour drawings (1857); the Seven Sacraments, seven cartoons (1860). Overbeck’s compositions, with few exceptions, are engraved. His life-work he sums up in the words—“Art to me is as the harp of David, whatever I would desire that psalms should at all times be sounded to the praise of the Lord.” He died in Rome in...
OVERBURY—OVERTURE

1660, aged eighty, and lies buried in San Bernardo, the church wherein he worshipped.

There are biographies by J. Beavington Atkinson (1882) and Howitt (1886).

OVERBURY, SIR THOMAS (1581-1613), English poet and essayist, and the victim of one of the most sensational crimes in English history, was the son of Nicholas Overbury, of Bourton-on-the-Hill, and was born in 1581 at Compton Scorpion, near Ilminster, in Warwickshire.

In the autumn of 1595 he became a gentleman commoner of Queen’s College, Oxford, took his degree of B.A. in 1598 and came to London to study law in the Middle Temple. He found favour with Sir Robert Cecil, travelled on the Continent and began to enjoy a reputation for an accomplished mind and free manners. About the year 1601, being in Edinburgh on a holiday, he met Robert Carr, then an obscure page to the earl of Dunbar; and so great a friendship was struck up between the two youths that they came up to London together.

The early history of Carr remains obscure, and it is probable that Overbury secured an introduction to Court before his young associate contrived to do so. At all events, when Carr attracted the attention of James I, in 1606, by breaking his leg in the tilt-yard, Overbury had for some time been servitor-in-ordinary to the king. He was knighted in June 1608, and in 1609 he travelled in France and the Low Countries. He seems to have followed the fortunes of Carr very closely, and “such was the warmth of the friendship, that they were inseparable, . . . nor could Overbury enjoy any felicity but in the company of him he loved [Carr].” When the latter was made Lord Rochester in 1610, the intimacy seems to have been sustained.

But it was now destroyed by a new element. Early in 1611 the Court became aware of the mutual attraction between Rochester and the infamous and youthful countess of Essex, who seemed to have bewitched the handsome Scots adventurer. To this intrigue Overbury was from the first violently opposed, pointing out to Rochester that an indulgence in such would be hurtful to his character and that the woman, even if at this early stage in her career, was already “noted for her injury and immodesty.” He went so far as to use, in describing her, a word which was not more just than scandalous. But Rochester was now infatuated, and he repeated to the countess what Overbury had said. It was at this time, too, that Overbury wrote, and circulated widely in MS., the poem called “His Wife,” which was a picture of the virtues which a young man should demand in a woman before he has the rashness to marry her.

It was represented to Lady Essex that Overbury’s object in writing this poem was to open the eyes of Rochester to her defects. The situation now resolved itself into a deadly duel for the person of Rochester between the mistress and the friend. The countess contrived to lead Rochester into such a trap as to make him seem disrespectful to the king, and she succeeded so completely that he was thrown into the Tower on the 22nd of April 1613. It was not known at the time, and is not known now, how far Rochester participated in this first crime, or whether he was ignorant of it. But the queen, by a foolish phrase, had sown discord between the friends; she had called Overbury Rochester “governor.” It is, indeed, apparent that Overbury had become arrogant with success, and was no longer a favourite at Court. Lady Essex, however, was not satisfied with having had him shut up; she was determined that “he should return no more to this stage.” She had Sir William Wade, the honest Governor of the Tower, removed to make way for a creature of her own, Sir Gervaise Elviss (or Helwys); and a gaoler, of whom it was ominously said that he was “a man well acquainted with the power of drugs,” was set to attend on Overbury. This fellow, afterwards aided by Mrs Turner, the widow of a physician, and by an apothecary called Frankfurt, plied the miserable poet with sulphuric acid in the form of copper vitriol. But his constitution long withstood the timid dose; the gaoler had been laggard. In his agonies until the 16th of September 1613, when more violent measures put an end to his existence. Two months later Rochester, now earl of Somerset, married the chief murderer, Lady Essex.

More than a year passed before suspicion was roused, and when it was, the king showed a hateful disinclination to bring the offenders to justice. In the celebrated trial which followed, however, the wicked plot was all discovered. The four accomplices were hanged; the countess of Somerset pleaded guilty but was spared, and Somerset himself was disgraced. Meanwhile, Overbury’s poem, The Wife, was published in 1614, and ran through six editions within a year, the scandal connected with the murder of the author greatly aiding its success.

It was abundantly reprinted within the next sixty years, and it continued to be one of the most widely popular books of the 17th century. Combined with later editions of The Wife, and gradually adding to its bulk, were “Characters” (first printed in the second of the 1614 editions), “The Remedy of Love” (1620), and “Observations in Foreign Travels” (1626). Later, much that must be spurious was added to the gathering snowball of Overbury’s Works. Poesy has found the praise of his contemporaries for the sententious and graceful moral verse of Overbury extravagantly expressed. The Wife is smooth and elegant, but uninspired. There is no question that the horrible death of the writer, and the extraordinary way in which his murderers were brought to justice, gave an extraneous charm to his writings. Nor can we be quite sure that Overbury was in fact such a “glorious constellation” of all the religious virtues as the 17th century believed. He certainly kept very bad company, and positive evidence of his goodness is wanting. But no one was ever more transcendently canonized by becoming the victim of conspirators whose crimes were equally detestable and unpopular.

OVERDOOR, the name given to any ornamental moulding placed over a door. The overdoor is usually architectural in form, but is sometimes little more than a moulded shelf for the reception of china or curiosities.

OVERMANTLE, the name given to decorative cabinet work, or joiynery, applied to the upper part of a fireplace. The overmantel is derived from the carved paneling formerly applied to chimney-pieces of importance, but the word is now generally restricted to a movable fitment, often consisting of a series of shelves and niches for the reception of ornaments.

OVERSOUL (Ger. Uberseele), the name adopted by Emerson to describe his conception of that transcendent unity which embraces subject and object, mind and matter, and in which all the differences in virtue of which particular things exist are absorbed. The idea is analogous to the various doctrines of the absolute, and to the Idea of Plato.

OVERSTONE, SAMUEL JONES LOYD, 1ST BARON (1760-1833), English banker, the only son of the Rev. Lewis Loyd, a Welsh dissenting minister, was born on the 25th of September 1760. He was educated at Eton and Trinity College, Cambridge. His father, who had married a daughter of John Jones, a banker of Manchester, had given up the ministry to take a partnership in his father-in-law’s bank, and had afterwards founded the London branch of Jones, Loyd & Co., afterwards incorporated in the London and Westminster Bank. Loyd, who had joined his father in the banking business, succeeded to it on the latter’s retirement in 1844. He conducted the business so successfully that on his death he left personal property of over £2,000,000. He sat in parliament as liberal member for Hythe from 1819 to 1826, and unsuccessfully contested Manchester in 1832. As early as 1832 he was recognized as one of the foremost authorities on banking, and he enjoyed much influence with successive ministries and chancellors of the exchequer. He was created Baron Overstone in 1850. He died in London on the 17th of November 1883, leaving one daughter, who married Robert James Loyd-Lindsay, afterwards Lord Wantage.

OVERT ACT (O. Fr. overtir, from ouvrir, to open), in law, an open act, one that can be clearly proved by evidence, and from which criminal intent can be inferred, as opposed to a mere thought, which is not admitted in the mind to commit a crime (see Intent). The term is more particularly employed in cases of treason (q.v.), which must be demonstrated by some overt or open act.

OVERTURE (Fr. ouverture, opening), in music, the instrumental introduction to a dramatic or choral composition. The
Overtures as a part of the baroque operas is a musical form that has its origins in the first operas of Monteverdi's Orfeo. The overture is a prelude to an opera, usually performed before the curtain rises. In modern times, the overture is often used as a separate piece, as in Richard Wagner's orchestral prelude to Tristan und Isolde. In operas of the classical period, the overture was often a dramatic and symphonic composition, setting the tone for the opera that follows. This was particularly true of Christoph Willibald Gluck's works, where the overtures were considered as an integral part of the opera. Johann Sebastian Bach's works are also notable for their use of the overture form, particularly in his instrumental suites and concertos. The overture was a popular form during the classical period, and it continued to be used in the Romantic era, with composers like Hector Berlioz and Richard Wagner expanding its scope and complexity. The overture's importance in opera increased in the Romantic era, with composers like Wagner and Berlioz writing large-scale overtures that set the stage for the opera to come. In the 20th century, the overture's role in opera became more varied, with some composers using it as a separate piece, while others used it as an introduction to the opera. Modern operas often feature a prelude or introduction that sets the stage for the opera, and this can take the form of an overture or a different type of piece altogether. Overall, the overture has a long and varied history in opera, and its importance in setting the tone for the drama that follows has been a key part of its enduring popularity.
of Dedemsvaart has been mostly reclaimed. This industry is now most active on the eastern borders between Almelo and Hardenberg, Vriezenveen being the chief tin colony. Cotton-spinning, together with bleaching-works, has come into prominence in the 19th century in the district of Twente. The reason of its isolated settlement here is to be found in the former general practice of weaving as a home craft and its organization as an industry by capitalist Baptist refugees who arrived in the 17th and 18th centuries. The chief town of the province is Zwolle, and other thriving industrial centres are Deventer, famous for its carpets and cake, and Almelo, Enschede, Hengelo and Oldenzaal in Twente. Kampen, Genemuiden, Vollenhove and Blokzyl, on the Zuider Zee, carry on some fishing trade. Near Vollenhove was the castle of Toutenburg, built in 1520–1533 by the famous stadtholder of the emperor Charles V., George Schenk. The castle was demolished in the beginning of the 19th century and the remains are slight. The railway system of the province is supplemented by steam tram-lines between Zwolle, Dedemsvaart and Hardenberg.

OVID [PUBLIUS OVIDIUS NASO] (43 B.C.–A.D. 17), Roman poet, the last of the Augustan age, was born in 43 B.C., the last year of the republic, the year of the death of Cicero. Thus the only form of political life known to Ovid was that of the absolute rule of Augustus and his successor. His character was neither strengthened nor soothed, like that of his older contemporaries, by personal recollection of the crisis through which the republic passed into the empire. There is no sense of political freedom in his writings. The spirit inherited from his ancestors was that of the Italian country districts, not that of Rome. He was born on the 20th of March (his self-consciousness has preserved the exact day of the month)4 at Sulmo, now Sulmona, a town of the Paeligni, picturesquely situated among the mountains of the Abruzzi: its wealth of waters and natural beauties seem to have strongly affected the young poet’s imagination (for he often speaks of them with affectionate admiration) and to have quickened in him that appreciative eye for the beauties of nature which is one of the chief characteristics of his poems. The Paeligni were one of the four small mountain peoples whose proudest memories were of the part they had played in the Social War. But in spite of this they had no old race-hostility with Rome, and their opposition to the senatorial aristocracy in the Social War would predispose them to accept the empire. Ovid, whose father was of equestrian family, belonged by birth to the same social class as Tibullus and Propertius, that of old hereditary landowners; but he was more fortunate than they in the immunity which his native district enjoyed from the confiscations made by the triumvirs. His vigorous vitality was apparently a gift transmitted to him by heredity; for he tells us that his father lived till the age of ninety, and that he performed the funeral rites to his mother after his father’s death. While he mentions both with the piety characteristic of the old Italian, he tells us little more about them than that “their thrice curtailed his youthful expenses,”12 and that his father did what he could to dissuade him from poetry, and force him into the more profitable career of the law. He and his brother had been brought early to Rome for their education, where they attended the lectures of two most eminent teachers of rhetoric, Aurelius Fuscus and Porcius Lattro, to which influence is due the strong rhetorical element in Ovid’s style. He is said to have attended these lectures eagerly, and to have shown in his exercises that his gift was poetical rather than oratorical, and that he had a distaste for the severer processes of thought.

Like Pope, “he lisped in numbers,”13 and he wrote and destroyed many verses before he published anything. The earliest edition of the Amores, which first appeared in five books, and the Heroides were given by him to the world at an early age. “Virgil,” he informs us, “he had only seen”; but Virgil’s friend and contemporary Aemilius Macer used to read his didactic poems to him; and even the fastidious Horace some- times delighted his ears with the music of his verse. He had a close bond of intimacy with the younger poets of the older generation—Tibullus, whose death he laments in one of the few pathetic pieces among his earlier writings, and Propertius, to whom he describes himself as united in the close ties of comradeship. The name of Maecenas he nowhere mentions. The time of his influence was past when Ovid entered upon his poetical career. But the veteran politician Messalla, the friend of Tibullus, together with his powerful son Cotta Messallinus and Fabius Maximus, who are mentioned together by Juvenal4 along with Maecenas as types of munificent patrons of letters, and other influential persons whose names are preserved in the Epistles from Pontus, encouraged his literary efforts and extended to him their support. He enjoyed also the intimacy of poets and literary men, chiefly of the younger generation, whose names he enumerates in Ex Pontio, iv, 16, though, with the exception of Domitian Marsus and Gratius, they are scarcely more than names to us. With the older poet, Macer, he travelled for more than a year. Whether this was immediately after the completion of his education, or in the interval between the publication of his earlier poems and that of the Medea and Ars amatoria is unknown, but it is in his later works, the Fasti and Metamorphoses, that we chiefly recognize the impressions of the scenes he visited. In one of the Epistles from Pontus (ii. 10) to his fellow-traveller there is a vivid record of the pleasant time they had passed together. Athens was to a Roman then what Rome is to an educated Englishman of the present day. Ovid speaks of having gone there under the influence of literary enthusiasm, and a similar impulse induced him to visit the supposed site of Troy. The two friends saw together the illustrious cities of Asia, which had inspired the enthusiasm of travel in Catullus, and had become familiar to Cicero and Horace during the years they passed abroad. They spent nearly a year in Sicily, which attracted him, as it had attracted Lucretius8 and Virgil,6 by its manifold charm of climate, of sea-shore and inland scenery, and of legendary and poetical association. He recalls with a fresh sense of pleasure the incidents of their tour, and the endless delight which they had in each other’s conversa- tion. We would gladly exchange the record of his life of pleasure in Rome for more of these recollections. The highest type of classic Roman culture shows its affinity to that of the Hellenistic by nothing more clearly than the enthusiasm—for travel among lands famous for their natural beauty, their monuments of art and their historical associations.

When settled at Rome, although a public career leading to senatorial position was open to him, and although he filled various minor judicial posts and claims to have filled them well, he had no ambition for such distinction, and looked upon pleasure and poetry as the occupations of his life. He was three times married; when little more than a boy to his first wife, whom he naively describes as unworthy of himself;7 but he was soon separated from her and took a second wife, with whom his union, although through no fault of hers, did not last long. She was probably the mother of his one daughter. Later he was joined to a third wife, of whom he always speaks with affection and respect. She was a lady of the great Fabian house, and thus connected with his powerful patron Fabius Maximus, and was a friend of the imperial house, and therefore seems likely that he may have been admitted into the intimacy of the younger society of the Palatine, although in the midst of his most fulsome flattery he does not claim ever to have enjoyed the favour of Augustus. His liaison with his mistress Corinna, whom he celebrates in the Amores, took place probably in the period between his first and second, or between his second and third marriages. It is doubtful whether Corinna was, like Catullus’ Lesbia, a lady of recognized position, or whether she belonged to

1 T. Trist. iv. 10. 13. 2 A. i. 3. 10. 3 T. Trist. iv. 10. 26 “ et quod temptabam scribere, versus erat.”
the same class as the Chloes and Lalages of Horace's artistic fanciful. If we can trust the poet's later apologies for his life, in which he states that he had never given occasion for any serious scandal, it is probable that she belonged to the class of libertinae. However that may be, Ovid is not only a less constant but he is a less serious lover than his great predecessors Catullus, Tibullus and Propertius. His tone is that of either mere sensuous feeling or of irony. In his complete emancipation from all restraint he goes beyond them, and thus reflects the tastes and spirit of fashionable Rome between the years 20 B.C. and the beginning of our era. Society was then bent simply on amusement; and, as a result partly of the loss of political interests, women came to play a more important and brilliant part in its life than they had done before. Julia, the daughter of the emperor, was by her position, her wit and beauty, and her reckless dissipation, the natural leader of such a society. But the discovery of her intrigue (2 B.C.) with Tullus Annonius, the son of Mark Antony, was deeply resented by Augustus as being at once a shock to his affections and a blow to his policy of moral reform. Julia was banished and disinherited; Annonius and his many lovers were punished; and the Roman world awoke from its fool's paradise of pleasure. Nearly coincidently with this scandal appeared Ovid's Ars amatoria, perhaps the most immoral work ever written by a man of genius, though not the most demoralizing, since it is entirely free from morbid sentiment. By its brilliancy and heartlessness it appealed to the prevailing taste of the fashionable world; but its appearance excited deep resentment in the mind of the emperor, as is shown by his edict, issued ten years later, against the book and its author. Augustus had the art of dissembling his anger; and Ovid appears to have had no idea of the storm that was gathering over him. He still continued to enjoy the society of the court and the fashionable world; he passed before the emperor in the annual procession among the ranks of the equites; and he developed a richer vein of genius than he had shown in his youthful prime. But his outside opinion had been shocked, or professed to be shocked, by his last work; and after writing a kind of apology for it, called the Remedia amoris, he turned to other subjects, and wrote during the next ten years the Metamorphoses and the Fasti. He had already written the Heroides, in which he had imparted a modern and romantic interest to the heroines of the old mythology, and a tragedy, the Medea, which must have afforded greater scope for the dramatic and psychological treatment of the passion with which he was most familiar. In the Fasti Ovid assumes the position of a national poet by imparting poetical life and interest to the ceremonial observances of the Roman religion; but it is as the brilliant narrator of the romantic tales that were so strangely blended with the realistic annals of Rome that he succeeds in the part assumed by him. The Metamorphoses is a narrative poem which recounts legends in which the miraculous involved transformations of shape. Beginning with the change from Chaos to Cosmos, legends first Greek and then Roman are passed in review, concluding with the metamorphosis of Julius Caesar into a star and a promise of immortality to Augustus. The long series of stories, which consist to a large extent of tales of the love adventures of the gods with nymphs and the daughters of men, is strongly tinged with Alexandrine influence, being in fact a succession of epyllia in the Alexandrine manner. This work, which Ovid regards as his most serious claim to immortality, had not been finally revised at the time of his disgrace, and in his despair he burnt it; but other copies were in existence, and when he was at Tomi it was published at Rome by one of his friends. He often regrets that it had not received his final revision. The Fasti also was broken off by his exile, after the publication of the first six books, treating of the first six months of the year.

Ovid assigns two causes for his banishment, his Ars amatoria, and an actual offense. What this was is not known, but his frequent references to it enable us to conjecture its character. He tells us that there was no breach of law on his part; he distinctly disclaims having been concerned in any reasonable plot: his fault was a mistake of judgment (error), an unpremeditated act of folly. He had been an unintentional witness of some culpable act committed by another or others—of some act which nearly affected the emperor, and the mention of which was likely to prove offensive to him. Ovid himself had reaped no personal gain from his conduct. Though his original act was a pardonable error, he had been prevented by timidity from atoning for it subsequently by taking the straightforward course. In a letter to an intimate friend, to whom he had been in the habit of confiding all his secrets, he says that had he confided this one he would have escaped condemnation. In writing to another friend he warns him against the danger of courting too high society. This offence, which excited the anger of Augustus, was connected in some way with the publication of the Ars amatoria, since that fact was known to the emperor in the meantime. All this points to his having been mixed up in a scandal affecting the imperial family, and seems to connect him with one event, coincident with the time of his disgrace (A.D. 9), the intrigue of the younger Julia, granddaughter of Augustus, with D. Silanus, mentioned by Tacitus. Augustus deeply felt these family scandals, looking upon them as acts of treason and sacrilege. Julia was banished to the island of Trimerus, off the coast of Apulia. Silanus withdrew into voluntary exile. The chief punishment fell on Ovid, who was banished. The poet at the worst could only have been a confidant of the intrigue; but Augustus must have regarded him and his works as, if not the corrupter of the age, at least the most typical representative of that corruption which had tainted so dively even the imperial family. Ovid's form of banishment was the mildest possible (relegatio); it involved no deprivation of civic rights, and left him the possession of his property. He was ordered to remove to the half-barbaric town of Tomi, near the mouth of the Danube. He recounts vividly the agony of his last night in Rome, and the hardships of his November voyage down the Adriatic and up the Gulf of Corinth to Lechaemen, where he crossed the isthmus and took ship again from Cenchreae to Samothrace, whence in the following spring he proceeded overland through Thrace to his destination. For eight years he bore up in his dreary solitude, suffering from the unhealthiness of the climate and the constant alarm of inroads of barbarians. In the hope of procuring a remission of his punishment he wrote poetical complaints, first in the series of the five books of the Tristia, sent successively to Rome, addressed to friends whose names he suppresses; afterwards in a number of poetical epistles, the Epistulae ex Ponte, addressed by name to friends who were likely to have influence at court. He believed that Augustus had softened towards him before his death, but his successor Tibere was irrevocably deposed by the emperor in person. His chief consolation was the exercise of his art, though as time goes on he is painfully conscious of failure in power. But although the works written by him in exile lack the finished art of his earlier writings, their personal interest is greater. They have, like the letters of Cicero to Atticus, the fascination exercised by those works which have been given to the world under the title of Confessions; they are a sincere literary expression of the state of mind produced by a unique experience—that of a man, when well advanced in years but still retaining extraordinary sensibility to pleasure and pain, withdrawn from a brilliant social and intellectual position, and cast upon his own resources in a place and among people affording the dreariest contrast to the brightness of his previous life. How far these confidences are to be regarded as equally sincere expressions of his affection or admiration for his correspondents is another question. Even in those addressed to his wife, though he speaks of her with affection and respect, there may perhaps be detected a certain ring of insincerity in his conventional comparisons of her to the Penelopes and Laodamias of ancient legend. Had she been a Penelope or Laodamia she would have accompanied him in...
his exile, as we learn from Tacitus was done by other wives in the more evil days of which he wrote the record. The letters, which compose the Tristia and Epistulae ex Ponto, are addressed either to his wife, the emperor, or the general reader, or to his patrons and friends. To his patrons he writes in a vein of supplication, beseeching them to use their influence on his behalf. To his rather large circle of intimate acquaintances he writes in the language of familiarity, and often of affectionate regard; he seeks the sympathy of some, and speaks with bitterness of the coldness of others, and in three poems he complains of the relentless hostility of the enemy who had contributed to procure his exile, and whom he attacked in the Ibis. There is a note of true affection in the letter to the young lyric poetess Perilla, of whose genius and beauty he speaks with pride, and whose poetic talents he had fostered by friendly criticism. He was evidently a man of gentle and genial manners; and, as his active mind induced him to learn the language of the new people on whom he was thrown, his active interest in literature enabled him to gain their regard and various marks of honour.

One of his last acts was to revise the Fasti, and re-edit it with a dedication to Germanicus. The closing lines of the Epistulae ex Ponto sound like the despairing sigh of a drowning man who had long struggled alone with the waves:

"Omnia perdidimus: tantummodo vita relicta est,
Praebeat ut sensum materiamque malis."

Shortly after these words were written he died in his sixty-first year in a.d. 17, the fourth year of the reign of Tiberius.

The temperament of Ovid, as indicated in his writings, has more in common with the suppleness of the later Italian than with the strength and force of the ancient Roman. That stamp of her own character and understanding which Rome impressed on the genius of those other races which she incorporated with herself is fainter in Ovid than in any other great writer. He ostentatiously disclaims the manliness which in the republican times was regarded as the birthright not of Romans only but of the Sabellian races from which he sprang. He is as devoid of dignity in his abandonment to pleasure as in the weakness with which he meets calamity. He has no depth of serious conviction, no vein of sober reflection, and is sustained by no great or elevating purpose. Although the beings of a supernatural world fill a large place in his writings, they appear stripped of all sanctity and mystery. It is difficult to say whether the tone of his references to the gods and goddesses of mythology implies a kind of half-believing return to the most childish elements of paganism, or is simply one of mocking unbelief. He has absolutely no reverence, and consequently inspires no reverence in his reader. With all a poet's feeling for the life, variety and subtlety of nature, he has no sense of her mystery and majesty. That which he celebrates is sensual and superficial, a matter of vanity as much as of passion. He prefers the pictorial attraction of falsehood and fickleness to the charm of truth and constancy. Even where he follows the Roman tendencies in his art he perverts them. The Fasti is a work conceived in the prosaic spirit of Roman antiquarianism. It is redeemed from being prosaic by the picturesque and vivacity with which the legends are told. But its conception might have been more poetical if it had been penetrated by the religious and patriotic spirit with which Virgil invests ancient ceremonies, and the mysticism with which he accepts the revelations of science. In this respect the contrast is great between the reverential treatment which the trivialities of legend and science receive in the Georgics and Aeneid, and the literal definiteness of the Fasti.

These defects in strength and gravity show a corresponding result in Ovid's writings. Though possessing diligence, perseverance and literary ambition, he seems incapable of conceiving a great and serious whole. Though a keen observer of the superficial aspects of life, he has added few great thoughts to the intellectual heritage of the world. But Ovid has that levity of his character he must have had qualities which made him, if not much esteemed, yet much liked in his own day, and which are apparent in the genial amiability of his writings. He claims for himself two virtues highly prized by the Romans, 

1 Tac. Hist. i. 3 "comitata profunsi libero matres, secutae martios in excilia conuosa."
2 Trist. iii. iv. 18.
3 Trist. iii. iv. 7.
4 Perilla has by many been erroneously supposed to have been the poet's own daughter; but this is impossible, since she is described as young and still living under her mother's roof, whereas at the time of Ovid's exile his daughter was already married to her second husband.

and candor—the qualities of social honour and kindly sincerity. There is no indication of anything base, ungenerous or morose in his relations to others. Literary candor, the generous appreciation of all sorts of excellence, he possesses in a remarkable degree. He heartily admires everything in literature, Greek or Roman, that had any merit. In him more than any of the Augustan poets we find words of admiration applied to the rude genius of Ennius and the majestic style of Accius. It is by him, not by Virgil or Horace, that Lucretius is first named and his sublimity is first acknowledged. The image of Catullus that most haunts the imagination is that of the poet who died so early—"

"hasta rupea virosa cinctus"

Tempora,"

as he is represented by Ovid coming to meet the shade of the young Tibullus in Elysium. To his own contemporaries, known and unknown to fame, he is as liberal in his words of recognition. He enjoyed society too in a thoroughly amiable and unenvious spirit. He lived on a friendly footing with a large circle of men of letters, poets, critics, grammarians, &c., and he showed none of that sense of superiority which is manifest in Horace's estimate of the "tribes of grammarians" and the poets of his day. Like Horace too he courted the society of the great, though probably not with equal independence; but unlike Horace he expresses no contempt for the humbler world outside. With his irony and knowledge of the world it might have been expected that he would become the social satirist of his age. But he lacked the censorious and critical temper, and the admixture of gall necessary for a successful satire; and he probably retaliated on one enemy and persistent detractor in the Ibis, a poem written in imitation of a similar work by Callimachus; but the Ibis is not a satire, but an invective remarkable rather for recondite learning than for epigrammatic sting.

But Ovid's chief personal endowment was his vivacity, and his keen interest in and enjoyment of life. He had no grain of discontent in his composition; no regrets for an ideal past, or longings for an imaginary future. The age in which he lived was, as he tells us, that in which more than any other he would have wished to live. He is its most gifted representative, but he does not rise above it. The great object of his art was to amuse and delight it by the vivid picture he presented of its fashions and pleasures, and by creating a literature of romance which reflected them, and which could stimulate the curiosity and fascinate the fancy of a society too idle and luxurious for serious intellectual effort. The sympathy which he felt for the love adventures of his contemporaries, to which he probably owed his fall, quickened his creative power in the composition of the Heroides and the romantic tales of the Metamorphoses. None of the Roman poets can people a purely imaginary world with such spontaneous fertility of fancy as Ovid. In heart and mind he is inferior to Lucretius and Catullus, to Virgil and Horace, perhaps to Tibullus and Propertius; but in the power and range of imaginative vision he is surpassed by no ancient and by few modern poets. This power of vision is the counterpart of his lively sensuous nature. He has a keener eye for the apprehension of outward beauty, for the life and colour and forms of nature, than any Roman or perhaps than any Greek poet. This power, acting upon the wealth of his varied reading, gathered with eager curiosity and received into a singularly retentive mind, has enabled him to depict with consummate skill and sympathy legendary scenes of the most varied and picturesque beauty. If his tragedy, the
OVID

Medea, highly praised by ancient critics, had been preserved, we should have been able to judge whether Roman art was capable of producing a great drama. In many of the Heroides, and in several speeches scattered through his works, he gives evidence of true dramatic creativeness. Unlike his great predecessor Catullus, he has little of the idyllic in his art, or whatever of idyllic there is in it is lost in the rapid movement of his narrative. But he is one, among the poets of all times, who can imagine a story with the most vivid inventiveness and tell it with the most unflagging animation. The faults of his verse and diction are those which arise from the vitality of his temperament—too facile a flow, too great exuberance of illustration. He has as little sense of the need of severe restraint in his art as in his life. He is not without mannerism, but he is quite unaffected, and, however far short he might fall of the highest excellence of verse or style, it was not possible for him to be rough or harsh, dull or obscure. As regards the school of art to which he belongs, he may be described as the most brilliant representative of Roman Alexandrinism. The latter half of the Augustan age was, in its social and intellectual aspects, more like the Alexandrine age than any other era of antiquity. The Alexandrine age was like the Augustan, one of refinement and luxury, of decline in magnificence and literature; but there was a difference: under the fostering of the Augustan epoch, an absolute monarch and the most important branch of literature cultivated, and the chief subjects of poetry were mythological tales, various phases of the passion of love, the popular aspects of science and some aspects of the beauty of nature. These two were the chief subjects of the later Augustan poetry. The higher feelings and ideas which found expression in the poetry of Virgil, Horace and the writers of an older generation no longer acted on the Roman world. It was to the private tastes and pleasures of individuals and society that Roman Alexandrinism had appealed both in the poetry of Catullus, Cinna, Calvus and their school, and in that of Gallus, Tibullus and Propertius. Ovid was the last of this class of writers.

His extant works fall naturally into three divisions, those of his youth, of middle life and of his later years. To the first of these divisions belong the amatory poems: (1) the three books of Amores (originally five, but reduced in a later recension to three) relating to his amours with his mistress Corinna; (2) the Metamorphoses, a tale of a hundred lines on the use of cosmetics; (3) the three books of the Ars amatoria, rules for men and women by which they may gain the affections of the other sex; (4) the Remedia amoris (one book), a kind of recantation of the Ars amatoria. To the second division belong: (5) the fifteen books of the Metamorphoses, and (6) the six books of the Fasti, which was originally intended to be in twelve books, but which breaks off the account of the Roman calendar with the month of June. To the third division belong: (7) the five books of the Tristia, (8) the Ibis, an invective against an enemy who had assisted to procure his fall, written in elegiac couplets probably soon after his exile; (9) the four books of Epistulæ ex Ponto. Of these the first three were published soon after the Tristia, while the fourth book is a collection of scattered poems published by some friend soon after the author's death. The Halieutica is a didactic fragment in hexameters on the natural history of fishes, of doubtful genuineness, though it is certain that Ovid did begin such a work at the close of his life.

In his extant works Ovid compared himself to Homer in metres—the elegiac couplet and the hexameter. The great mass of his poetry is written in the first; while the Metamorphoses and the Halieutica are composed in the second. Of the elegiac couplet he is the acknowledged master. By fixing it into a uniform mould he brought it to its highest perfection; and the fact that the great mass of elegiac verse written subsequently has endeavoured merely to reproduce the echo of his rhythm is evidence of his pre-eminence. In the direct expression and illustration of feeling his elegiac metre has more ease, vivacity and sparkle than that of any of his predecessors, while he alone has communicated to it, without altering its essential characteristic of recurrent and regular pauses, a fluidity and rapidity of movement which make it an admirable vehicle for pathetic and picturesque narrative. It was impossible for him to give to the hexameter greater perfection, but he imparted to it also a new character, wanting indeed the weight and majesty and intricate harmonies of Virgil, but rapid, varied, animated in complete accord with the swift, versatile and fervid movement of his imagination. One other proof he gave of his irrepressible energy by composing during his exile a poem in the Gotic (Gothic) language in praise of Augustus, Tiberius and the imperial family, the loss of which, whatever it may have been to literature, is much to be regretted in the interests of philology.

It was in Ovid's writings that the world of romance and wonder created by Greek imagination was first revealed to modern times. The vivid fancy, the transparent lucidity, the liveliness, ease and directness through which he reproduced his models made his works the most accessible and among the most attractive of the recovered treasures of antiquity. His influence was first felt in the literature of the Italian Renaissance. But in the most creative periods of English literature he seems to have been read more than any other ancient poet, excepting Virgil, and excepting Shakespeare. As a Renaissance poet he was followed by Marlowe, and Shakespeare, Milton and Dryden that he acted most powerfully. His influence is equally unmistakable during the classical era of Addison and Pope. The most successful Latin verse of modern times has been written in imitation of him; the faculty of literary composition and feeling for ancient Roman culture has been largely developed in the great schools of England and France by the writing of Ovidian elegics. His works afforded also abundant stimulus and materials to the great painters who flourished during and immediately after the Renaissance. Thus his first claim on the attention of modern readers is the influence which he has exercised on the development of literature and art; for this, if for no other reason, his works must always retain an importance second only to those of Virgil and Horace.

He is interesting further as the sole contemporary exponent of the last half of the Augustan age, the external aspects and inner spirit of which is known from the works, not of contemporary historians or prose-writers, but from his poems. The successive phases of Roman feeling and experience during this critical period are for the most part reflected in Ovid's poems. Virgil throws an idealizing and religious halo around the hopes and aspirations of the nascent empire. Horace presents the most complete image of its manifold aspects, realistic and ideal. Ovid reflects the life of the world of wealth and fashion under the influence of the new court, its material prosperity, its refinement, its frivolity and its adulation. For the continuous study of the Roman world in its social and moral relations his place is important as marking the transition between the representation of Horace, in which the life of pleasure and amusement has its place, but is subordinate to the life of reflection and serious purpose, and that life which reveals itself in the cynicism of Martial and the scornful indignation of Juvenal. He is the last true poet of the great age of Roman literature, which begins with Lucretius and closes with him. No Roman poet writes with such vivacity and fertility of fancy; in respect of these two qualities we recognize in him the countryman of Cicero and Livy. But the type of genius of which he affords the best example is more familiar in modern Italian than in ancient Roman poetry. While the serious spirit of Lucretius and Virgil reappeared in Dante, it is Ariosto who may be said to reproduce the light-hearted gaiety and brilliant fancy of Ovid.

BIBLIOGRAPHY.—The life of Ovid was first treated systematically by J. Masson, Ovidi vita ordine chronologico digesta (1780) (often reprinted, e.g. in Burmann's edition). Modern literature on this subject will be found in Teuffel's History of Roman Literature (Eng. trans., ed. 2), § 247 and S. G. Owen's edition of his works. The very numerous manuscripts of Ovid are chiefly of late date, 13th to 15th century. The earliest and best are: for the Heroides a Paris MS. of the 9th, a Wolfenbüttel MS. of the 12th and an Eton
OVIEDO, a maritime province of northern Spain, bounded by the N. by the Bay of Biscay, by Santander, S. by Leon and W. by Lugo. Pop. (1900) 627,069; area, 4,205 sq. m. In popular speech Oviedo is often called by its ancient name of Asturias, which only ceased to be the official title of the province in 1853, when the Spanish system of local government was reorganized. An account of the physical features and inhabitants of this region is given under Asturias (q.v.). Oviedo is rich in forests, coal, streams and waterfalls, which have largely contributed to its modern industrial development. The climate is generally mild, but overcharged with humidity, and in the higher regions the winters are protracted and severe. The broken character of the surface prevents anything like extensive agricultural industry, but abundant pasturage is found in the valleys. The wheat crop frequently fails. Rye succeeds better, and is often mixed with the maize which forms the principal food of all but the higher classes. Chestnuts—here, as elsewhere in Spain, an important article of diet—are very abundant on the hills, and the trees supply valuable timber. Apples are abundant, and cider forms the common drink of the people; but little attention is paid to vines. The horses of Oviedo rank among the best in Spain. Wild deer, boars and bears were formerly common among the mountains; and the sea-costs, as well as the streams, abound with fish, including salmon and lampreys, which are sent to the markets of Madrid. Large quantities of sardines and tunny are also cured and exported. Although no trace exists of the gold for which Asturias was celebrated under its Roman rulers, Oviedo possesses valuable coal treasures, which are worked at Langreo, Mieres, Siero and Santander. More than 500,000 tons of coal were produced in 1903, besides a considerable amount of iron, mercury and cinnabar. The copper mines near Avilés and Cangas de Onís, and the copper works which long supplied the fairs of Leon and Castile with kettles, pots and similar utensils, have lost their importance; but lead, magnesia, arsenic, cobalt, lapis lazuli, alum, antimony, jet, marble and rock-crystal are found in various parts of the province, while amber and coral are gathered along the coast. There are manufactures of fine textiles, coarse cloth and ribbons in Salas, Piloña, Casas and Avilés; of paper in Pianton; of porcelain and glass in Gijón, Avilés and Pola de Surro; of arms in Oviedo and Trubia; while foundries and works for the manufacture of agricultural implements, rails and pig-iron are numerous. An important highway is the 16th-century Camino real, or royal road, leading from Gijón to Leon and Madrid, which cost so much that the emperor Charles V. inquired if they were paved with silver. A railway from Madrid to Oviedo, Gijón and Avilés runs through some of the most difficult parts of the Cantabrian chain. There are also several branch railways, including numerous narrow-gauge lines. OVIEDO, an episcopal city and capital of the Spanish province of Oviedo, and of the diocese of the same name, is situated in the county of Nalon, and on the Leon-Gijón Oviedo-Trubia and Oviedo-Infesto railways. Pop. (1900) 48,103. Oviedo is built on a hill rising from a broad and picturesque valley, which is bounded on the north-west by the Sierra de Naranco. The four main streets of Oviedo, which meet in a central square called the Plaza Mayor or Plaza de la Constitución, are the roads connecting Gijón and Leon (north and south) and Santander and Grado (east and west). The streets are clean and well lighted; the projecting roofs of the houses give a characteristic effect, and some portions of the old Calle de la Platería are highly picturesque. In the Plaza Mayor is the handsome Casa Consistorial or town hall dating from 1602; the Jesuit church of San Isidro (1678); and some ancient palaces of the Asturian nobility are architecturally interesting. The university was founded by Philip III. in 1604; connected with it are a fine library and physical and chemical museums. The Gothic cathedral, founded in 1588, occupies the site of a chapel founded in the 8th century, of which only the Camara Santa remains. The west front has a fine portico of ornamental arches between the two towers. The interior contains some fine stained glass, but has been much disfigured with modern roccoco additions. The Camara Santa (dating from 590) contains the famous arca of Oviedo, an 11th-century Byzantine chest of cedar, overlaid with silver reliefs of scenes in the lives of Christ, the Virgin and the apostles. In it are preserved some highly sacred relics, two crosses from the 8th and 9th centuries.
and other valuable pieces of gold and silver plate. The cathedral library has some curious old MSS., including a deed of gift made by Alphonso II of Asturias in 872, and a collection of illuminated documents of the 12th century, called the Libro gótico. On the Sierra de Naranco is the ancient Santa María de Naranco, originally built by Ramiro I of Asturias in 850 as a palace, and afterwards turned into a church. Higher up the hill is San Miguel de Lino, also of the 9th century; and on the road to Gijón, about a mile outside the town, is the Santullano or church of St Julian, also of very early date. Few towns in Spain have better schools for primary and higher education, and there are a literary and scientific institute, a meteorological observatory, a school for teachers, a school of art, adult classes for artisans, an archaeological museum and several public libraries. Oviedo is the centre of a thriving trade in agricultural products; its other industries are marble-quarrying, and the manufacture of arms, cotton and woollen fabrics, iron goods, leather and matches. Oviedo, founded in the reign of Frueela (762), became the fixed residence of the kings of the Asturias in the time of Alphonso II, and continued to be so until about 924, when the advancing reconquest of Spain from the Moors led them to remove their capital to Leon. The early history of the city was comparatively uneventful, until the Peninsular War, when it was twice plundered by the French—under Ney in 1809 and under Bonnet in 1810.

**Oviedo y Valdés, Gonzalo Fernández de** (1478-1557), Spanish historian, was born at Madrid in August 1478. Educated at the court of Ferdinand and Isabella, in his thirteenth year he became page to their son, the Infante Don John, was present at the siege of Granada, and there saw Columbus previous to his voyage to America. On the death of Prince John (4th of October 1497), Oviedo went to Italy, and there acted as secretary to Gonzalo Fernández de Cordoba. In 1514 he was appointed supervisor of gold-smeltings at San Domingo, and on his return to Spain in 1523 was appointed historiographer of the Indies. He paid five more visits to America before his death, which took place at Valladolid in 1557.

Besides a romance of chivalry entitled Claribalte (1570) Oviedo wrote two extensive works of permanent value: La General y natural historia de las Indias and Las Quinquagenas de la noblesa de España. The former work was first issued at Toledo (1526) in the form of a summary entitled La Natural historia de las Indias; the first part of La Historia general de las Indias appeared at Seville in 1539, but the complete work was not published until 1552 when it was edited by J. A. de los Rios for the Spanish Academy of History. Though written in a diffusé style, it embodies a mass of curious information collected at first hand, and the incomplete Seville edition was replaced in 1554 by a more comprehensive one published by Eden and Polemius respectively in 1555 and 1556. Las Casas describes it as "containing almost as many lies as pages," and Oviedo undoubtedly puts the most favourable interpretation on the proceedings of his countrymen; but, apart from a patriotic bias which is too obvious to be misleading, his narrative is both trustworthy and interesting. In his Quinquagenas he indulges in much lively gossip cor.earning eminent contemporaries; this collection of quaint, moralizing anecdotes was first published in Madrid in 1580, under the editorship of Vicente de la Fuente.

**Ovolo** (adapted from Ital. ovolo, diminutive of ovo, an egg; other foreign equivalents are Fr. oie, éciron, quarte de rond; Lat. echinus), in architecture, a convex moulding known also as the echinus, which in Classic architecture was invariably carved into small balls, rings and tongues. In Roman and Italian work the moulding is called by the Latin name. It must not be confounded with the echinus of the Greek Doric capital, as this was of a more varied form and of much larger dimensions than the ovolo, which was only a subordinate moulding.

**Owatonna,** a city and the county-seat of Steele county, Minnesota, U.S.A., on the Straight river, in the S.E. part of the state, about 67 m. S. of Minneapolis and St Paul. Pop. (1900) 5561, of whom 1160 were foreign-born; (1905) 5651; (1910) 5658. It is served by the Chicago, Milwaukee & St Paul, the Chicago & North-Western, the Chicago, Rock Island & Pacific and the Minneapolis, Rochester & Dubuque (electric) railways. Four fine steel bridges span the river at or near the city. Among the public buildings are a handsome county court-house, a city hall, an armoury, a city hospital and a public library. Owatonna is the seat of the Pillsbury Academy (Baptist), the Sacred Heart Academy (Roman Catholic) and the Canfield Commercial School, and immediately west of the city is the State Public School for Dependent and Neglected Children (1880). The city's commercial importance is largely due to its situation in rich dairying and farming district, for which it is the shipping centre. It has also various manufactures. There are valuable mineral springs in the vicinity. The municipality owns and operates the water-works. Owatonna was settled about 1855, was incorporated as a village in 1865, was chartered as a city in 1875 and received a new charter in 1909. Its name is a Sioux word meaning "straight," the river having been previously named Straight river.

**Owego,** a village and the county-seat of Tioga county, New York, U.S.A., on the Owego Creek and on the N. side of the Susquehanna river, 21 m. W. of Binghamton. Pop. (1910, U.S. census) 4933. It is served by the Erie, the Lehigh Valley and the Delaware, Lackawanna & Western railways; a branch of the last connects with Ithaca, N.Y. Owego occupies the site of an Indian (probably Tuscarora) village name d "Ah-wa-ga," which was destroyed by General James Clinton in 1779. The name, of which "ah-wa" is a corruption, is said to mean "the valley widens." A white settlement and trading post were set up here in 1785, and the village of Owego was incorporated in 1827.

**Owen, Sir Hugh** (1804-1881), Welsh educationist, was born near Tal-yfoel Ferry, Anglesey, on the 14th of January 1804. Educated at a private school at Carnarvon, he became clerk in 1825 to a barrister in London. In 1836 he entered the office of the Poor Law Commission, eventually becoming chief clerk of the Poor Law Board, and retiring in 1872 to devote himself exclusively to educational work. As early as 1839 he had become secretary for an association to start a national school in Islington, and in 1843 he had published A Letter to the Welsh People on the need of educational activity, which was widely read. Successful in arousing the interest of the British and Foreign School Society, he became in 1846 honorary secretary of its newly-formed branch, the Cambrian School Society. He was one of the founders of the Bangor Normal College, for the training of teachers, and of the University College of Wales at Aberystwyth, for which many years he was honorary secretary and treasurer. He was for three years a member of the London School Board. His scheme for secondary education, formulated in 1881, was almost wholly adopted after his death in the Welsh Intermediate Education Act of 1886. The revival of the Honourable Cymrodorion Society, the National Eisteddfod Association and the Social Science Section of the National Eisteddfod was due to Owen. He was knighted in recognition of his service to Welsh education in August 1881, but died at Montone on the 20th of November. A bronze statue was erected at Carnarvon in 1888 by public subscription.

**Owen, John** [Owenus or Oudenus] (c. 1560-1622), Welsh epigrammatist, was born at Plas Dhu, Carnarvonshire, about 1560. He was educated under Dr Bilson at Winchester School, and at New College, Oxford. He was a fellow of his college from 1584 to 1591, when he became a schoolmaster, first at Trelesec, near Monmouth, and then at Warwick, where he was master of the school endowed by Henry VIII. He became distinguished for his perfect mastery of the Latin language, and for the humour, felicity and point of his epigrams. The Continental scholars and wits of the day used to call him "the English Horace." He was a staunch Protestant besides, and could not resist the temptation of turning his wit against the Roman Catholic Church. This practice caused his book to be placed on the Index prohibitorius in 1654, and led a rich old uncle of the Roman Catholic communion to cut him out of his will. When the poet died in 1622, his countryman and relative, Bishop Williams of Lincoln, who is said to have supported him in his later years, erected a monument to his memory in St Paul's cathedral with a Latin epitaph.

Owen's Epigrammata are divided into twelve books, of which the first four were published in 1606, and the rest at four different
times. Owen frequently adapts and alters to his own purpose the lines of his predecessors in Latin verse, and one such borrowing has become celebrated as a quotation, though few know where it is to be found. It is the first line of this epigram:

"Tempora mutantur, nos et mutamur in illis: Quo modo? / quod sine tempore posse homin." (Lib. I. ad Eudoardum Noel, epig. 58.)

This first line is altered from an epigram by Matthew Borbonius, one of a series of motteos for various emperors, this one being for Lothaire I.

"Omnia mutantur, nos et mutamur in illis: Illa vives quasdam res habet, illa vives."

There are editions of the Epigrammata by Elyzerv and by Didot; the best is that edited by Renouard (2 vols., Paris, 1795). Translations into English, either in whole or in part, were made by Vicars (1619); by Peck, in his Parnassus Puerorum (1650); and by Harvey in 1677, which is the most complete. La Torre, the Spanish epigrammatist, owed much to Owen, and translated his works into Spanish in 1674. French translations of the best of Owen's epigrams were published by A. L. Lebrun (1709) and by Kerival (1740).

OWEN, JOHN (1616-1683), English Nonconformist divine, was born at Stadham in Oxfordshire in 1616, and was educated at Queen's College, Oxford (B.A. 1632, M.A. 1635), noted, as Fuller tells us, for its metaphysicians. A Puritan by training and conviction, in 1637 Owen was driven from Oxford by Laud's new statutes, and became chaplain and tutor in the family of Sir Robert Dormer and then in that of Lord Lovelace. At the outbreak of the civil troubles he sided with the parliament, and thus lost both his place and the prospects of succeeding to his Welsh royalist uncle's fortune. For a while he lived in Charterhouse Yard, in great unsettlement of mind on religious questions, which was removed at length by a sermon preached by a stranger in Aldermanbury Chapel whither he had gone to hear Edmund Calamy. His first publication, The Display of Arminianism (1642), was a spirited defence of rigid Calvinism. It was dedicated to the committee of religion, and gained him the living of Fordham in Essex, from which a "scandalous minister" had been ejected. At Fordham he remained engrossed in the work of his parish and writing only The Duty of Pastors and People Distinguishing (1645) until 1646, when, the old incumbent dying, the presentation lapsed to the patroon, who gave it to some one else. He was now, however, coming into notice, for on the 29th of April he preached before the Long Parliament. In this sermon, and still more in his Country Essay for the Practice of Church Government, which he appended to it, his tendency to break away from Presbyterianism to the more tolerant Independent or Congregational system is plainly seen. Like Milton he saw little to choose between "new presbytery" and "old priest," and disliked a rigid and arbitrary policy by whatever name it was called. He became pastor at Coggleshall in Essex, where a large influx of Flemish traders provided a congenial Independent atmosphere. His adoption of Congregational principles did not affect his theological position, and in 1647 he again attacked the Arminians in The Death of Death in the Death of Christ, which drew him into long debate with Richard Baxter. He made the friendship of Fairfax while the latter was besieging Colchester, and urgently addressed the army there against religious persecutions. He was chosen to preach to parliament on the day after the execution of Charles, and succeeded in fulfilling his delicate task without rebuking the committee. After this sermon he preached on the 19th of April, a vigorous plea for sincerity of religion in high places, won not only the thanks of parliament but the friendship of Cromwell, who carried him off to London as his chaplain, that he might regulate the affairs of Trinity College. He pleaded with the House of Commons for the religious needs of Ireland as some years earlier he had pleaded for those of Wales. In 1650 he accompanied Cromwell on his Scottish campaign. In March 1652 Cromwell, as chancellor of Oxford, gave him the deanship of Christ Church, and made him vice-chancellor in September 1652; in both offices he succeeded the Presbyterian Edward Reynolds.

During his eight years of official Oxford life Owen showed himself a firm disciplinarian, and infused a new spirit of thoroughness into dons and undergraduates alike, though, as John Locke testifies, the Aristotelian traditions in education suffered no change. With Philip Nye he unmasked the popular astrologer, William Lilly, and in spite of his share in condemning two Quakers, neither called to suffer for disturbing the peace, his rule was not intolerant. Anglican services were conducted here and there, and at Christ Church one of the Anglian chaplains remained in the college. While little encouragement was given to a spirit of free inquiry, it is unhistorical to say that Puritanism at Oxford was simply "an attempt to force education and culture into the leaden moulds of Calvinistic theology." It must be remembered, too, that Owen, unlike many of his contemporaries, found his chief interest in the New Testament rather than the Old. During his Oxford years he wrote Justitia Divina (1653), an exposition of the dogma that God cannot forgive sin without an atonement; Communion with God (1657), which has been called a "piece of wife-drawn mysticism"; Doctrine of the Saints' Perseverance (1654), his final attack on Arminianism; Vindiciae Christianae, a treatise written by order of the Council of State against Socinianism as expounded by John Bidle; On the Morification of Sin in Believers (1656), an introspective and analytic work; Schism (1657), one of the most readable of all his writings; Of Temptation (1658), an attempt to recall Puritanism to its cardinal spiritual attitude from the jarring anarchy of sectarianism and the pharisaism which had followed on popularity and threatened to destroy the early simplicity.

Besides all his academic and literary concerns Owen was continually in the midst of affairs of state. In 1651, on October 24 (after Worcester), he preached the thanksgiving sermon before parliament. In 1652 he sat on a council to consider the condition of Protestantism in Ireland. In October 1653 he was one of several ministers whom Cromwell summoned to a consultation as to church union. In December the degree of D.D. was conferred upon him by his university. In the parliament of 1654 he sat, but only for a short time, as member for Oxford university, and, with Baxter, was placed on the committee for settling the"fundamentals"necessary for the toleration promised in the Instrument of Government. In the same year he was chairman of a committee on Scottish Church affairs. He was, too, one of the Triers, and appears to have behaved with kindness and moderation in that capacity. As vice-chancellor he acted with readiness and spirit when a Royalist risque Willett broke out in 1655; his adherence to Cromwell, however, was by no means implicit, for he drew up, at the request of Desborough and Pride, a petition against him, receiving the kingship. Thus, when Richard Cromwell succeeded his father as chancellor, Owen lost his vice-chancellorship. In 1658 he took a leading part in the conference of Independents which drew up the Savoy Declaration.

On the death of Cromwell Owen joined the Wallingford House party, and though he denied any share in the deposition of Richard Cromwell, he threw all his weight on the side of a simple republic as against a protectorate. He assisted in the restoration of the Rump parliament, and, when Monk began his march into England, Owen, in the name of the Independent churches, to whom Monk was supposed to belong, and who were keenly anxious as to his intentions, wrote to dissuade him from the enterprise.

In March 1660, the Presbyterian party being uppermost, Owen was further deprived of his deanship, which was given back to Reynolds. He retired to Stadham, where he wrote various controversial and theological works, in especial the labours Theophrastus Pantodapu, a history of the rise and progress of theology. This work in which many of the authorities held his intellectual esteem and opinion is denied to other Nonconformists. In 1661 was published the celebrated Fict Lus, a work by the Franciscan monk John

1 H. L. Thompson, Christ Church ("Oxford College Histories") pp. 70 seq.
2 Owen made a very unhappy attack on Brian Walton's Polyglot Bible.
3 Owen probably drew up the scheme for a national church surrounded by bodies of tolerated dissent which was presented to parliament. See D. Masson, Milton, iv. 390, 566.
Vincent, Cane, in which the oneness and beauty of Roman Catholicism are contrasted with the confusion and multiplicity of Protestant sects. At Clarendon's request Owen answered this in 1662 in his Animadversiones; and so great was his success that he was offered preferment if he would conform. Owen's condition for making terms was liberty to all who agree in doctrine with the Church of England; nothing therefore came of the negotiation.

In 1663 he was invited by the Congregational churches in Boston, New England, to become their minister, but declined. The Conventicle and Five Mile Acts drove him to London; and in 1666, after the Fire, he, like other leading Nonconformist ministers, fitted up a room for public service and gathered a congregation, composed chiefly of the old Commonwealth officers. Meanwhile he was incessantly writing; and in 1667 he published his Catechism, which led to a proposal, "more acute than diplomatic," from Baxter for union. Various papers passed, and after a year the attempt was closed by the following laconical note from Owen: "I am still a well-wisher to these mathematicians." It was now, too, that he published the first part of his vast work upon the Epistle to the Hebrews, together with his exposition of Psalm 130 and his searching book on Indwelling Sin.

In 1669 Owen wrote a spirited remonstrance to the Congregational clergy of New England, when, under the influence of Presbyterianism, had shown themselves "theophrastus". At home too, he was busy in the same cause. In 1670 Samuel Park's Ecclesiastical Polity attacked the Nonconformists in a style of clumsy intolerance. Owen answered him (Truth and Innocence Vindicated); Park replied with personalities as to Owen's connexion with Wallingford House. Then Andrew Marvell with barter and satire finally disposed of Park in The Rehearsal Transposed. Owen himself produced a tract On the Trinity (1660), and Christian Love and Peace (1672).

At the revival of the Conventicle Acts in 1670, Owen was appointed to draw up a paper of reasons which was submitted to the House of Lords in protest. In this or the following year Harvard College invited him to become its president; he received similar invitations from some of the Dutch universities.

When Charles issued his Declaration of Indulgence in 1672, Owen drew up an address of thanks. This indulgence gave the dissenters an opportunity for increasing their churches and services, and Owen was one of the first preachers at the weekly lectures, which the Independents and Presbyterians jointly held at Princes' Hall in Broad Street. He was held in high esteem by a large number of the nobility (one of the many things which point to the fact that Congregationalism was by no means the creed of the poor and insignificant), and during 1674 both Charles and James held prolonged conversations with him in which they assured him of their good wishes to the dissenters. Charles gave him 1000 guineas to relieve those upon whom the severe laws had chiefly pressed, and he was even able to procure the release of John Bunyan, whose preaching he ardently admired. In 1674 Owen was attacked by William Sherlock, dean of St Paul's, whom he easily vanquished, and from this time until 1680 he was engaged upon his ministry and the writing of religious works. The chief of these were On Apostasy (1676), a sad account of religion under the Restoration; On the Holy Spirit (1677-1678) and The Doctrine of Justification (1677). In 1680, however, Stillingfleet having on May 17 preached his sermon on "The Mischief of Separation," Owen defended the Nonconformists from the charge of schism in his Brief Vindication.

Baxter and Howe also answered Stillingfleet, who replied in The Irreconcilability of Separation. Owen again answered this, and then left the controversy to a swarm of eager combatants. From this time to his death he was occupied with continual writing, disturbed only by suffering from stone and asthma, and by an absurd charge of being concerned in the Rye House Plot. His most important work was his Treatise on Evangelical Churches, in which were contained his latest views regarding church government. He died at Ealing on the 24th of August 1683, just twenty-one years after he had gone out with so many others on St Bartholomew's day in 1662, and was buried on the 5th of September in Bunhill Fields.
Owen, ROBERT

animals. His Comparative Anatomy and Physiology of Vertebrates (3 vols., London, 1866-1869) was indeed the result of more personal research than any similar work since Cuvier's "Livre de l'animal et de l'homme". He not only studied existing forms, but also devoted great attention to the remains of extinct groups, and immediately followed Cuvier as a pioneer in vertebrate palaeontology. Early in his career he made exhaustive studies of teeth, both of existing and extinct animals, and published his profusely illustrated work on "Odontology" (1840-1845). He discovered and described the remarkably complex structure of the teeth of the extinct animals which he named labyrinthodonts. Among his writings on fishes, his memoir on the African mud-fish, which he named "Protopterus", laid the foundations for the recognition of the Dipnoi by Johannes Müller. He also pointed out later the serial connexion between the teleostean and ganoid fishes, grouping them in one sub-class, the Teleostomi. Most of his work on reptiles referred to the skeletons of extinct forms, and his chief memoirs on British reptiles were published in a connected series in his History of British Fossil Reptiles (4 vols., London, 1849-1884). He published the first important general account of the great mass of Mesozoic land-reptiles, to which he gave the new familiar name of Dinosauria. He also first recognized the curious early Mesozoic land-reptiles, with affinities both to amphibians and mammals, which he termed Anomodontia. Most of these were obtained from South Africa, beginning in 1845 (Dicyonodon), and eventually furnished materials for his Catalogue of the Fossil Reptilia of South Africa, issued by the British Museum in 1876. Among his writings on birds, his classical memoir on the Aepyornis (1840-1846), a long series of papers on the extinct Dinosaurithes of New Zealand, other memoirs on Aepyornis, Notornis, the dodo, and the great auk, may be specially mentioned. His monograph on Archaeopteryx (1863), the long-tailed, toothed bird from the Bavarian lithographic stone, is also an epoch-making work. With regard to the amphibians and mammals, comparable analyses relate to the monotremes, marsupials, and the anthropoid apes. He was also the first to recognize and name the two natural groups of typical Ungulata, the odd-toed (Perissodactyla) and the even-toed (Artiodactyla), while describing some fossil remains in 1848. Most of his writings on mammals, however, deal with extinct forms, to which his attention seems to have been first directed by the remarkable fossils collected by Darwin in South America. Toxodon, from the pampas, was then described, and gave the earliest clear evidence of an extinct generalized hoof animal, a "pachyderm with affinities to the Rodentia, Edentata, and Herbivorous Cetacea". Owen's interest in South American extinct mammals then led to the recognition of the giant armadillo, which he named Glyptodon (1839), and to classic memoirs on the giant ground-sloths, Mylodon (1842) and Megatherium (1866), besides other important contributions. At the same time, Thomas Mitchell's new discoveries of fossile bones in New South Wales provided material for the first of Owen's long series of papers on the extinct mammals of Australia, which were eventually reprinted in book-form in 1877. He discovered Diprotodon and Thylacoleo, besides extinct kangaroos and wombats of gigantic size. While occupied with so much material from abroad, Owen was also busily collecting facts for an exhaustive work on similar fossils from the British Isles, and in 1844-1846 he published his History of British Fossil Mammals and Birds, which was followed by many later memoirs, notably his Monograph of the Fossil Mammalia of the Mesozoic Formations (Paleont. Soc., 1871). One of his latest publications was a little work entitled Antiquity of Man as deduced from the Discovery of a Human Skeleton during Excavations of the Docks at Tilbury (London, 1884).

Owen's detailed memoirs and descriptions require laborious attention in reading, on account of their nomenclature and ambiguous modes of expression; and the circumstance that very little of his terminology has found universal favour causes them to be more generally neglected than they otherwise would be. At the same time it must be remembered that he was a pioneer in concise anatomical nomenclature; and, so far as at least the vertebrate skeleton is concerned, his terms were based on a carefully reasoned philosophical scheme, which first clearly distinguished between the now familiar phenomena of "analog" and "homology". Owen's theory of the Archeopteryx and Homologies of the Vertebrate Skeleton (1848), subsequently illustrated also by his little work On the Nature of Limbs (1840), regarded the vertebrate frame as consisting of a series of fundamentally identical segments, each modified according to its position and functions. Much of it was fanciful, and failed when tested by the facts of embryology, which Owen systematically ignored throughout his work. However, though an imperfect and distorted view of certain great truths, it possessed a distinct value at the time of its conception. To the discussion of the deeper problems of biological philosophy he made scarcely any direct and definite contributions. His generalities rarely extended beyond strict comparative anatomy, the phenomena of adaptation to function, and the facts of geographical or geological distribution. His lecture on "virgin reproduction" or parthenogenesis, however, published in 1849, contained the essence of the theory of the germ-plasm elaborated later by August Weismann; and he made several vague statements concerning the geological succession of genera and species of animals and their possible derivation one from another. He referred especially to the changes exhibited by the successive forerunners of the crocodiles (1884) and horses (1868); but it has never become clear how much of the modern doctrines of organic evolution he admitted. He contented himself with the bare remark that "the productive function of the germ and mode of operation of the laws governing life would 'henceforth be the great aim of the philosophical naturalist.'"

Owen, ROBERT (1771-1858), English social reformer, was born at Newtown, near Newtownards, in North Wales, on the 14th of July 1771. His father had a small business in Newtown as saddler and ironmonger, and there young Owen received all his school education, which terminated at the age of nine. After serving in a draper's shop for some years he settled in Manchester. His success was very rapid. When only nineteen years of age he became manager of a cotton mill in which five hundred people were employed, and by his administrative intelligence and energy soon made it one of the best establishments of the kind in Great Britain. In this factory Owen used the first bags of American sea-island cotton ever imported into the country; it was the first sea-island cotton from the Southern States. Owen also made remarkable improvement in the quality of the cotton spun; and indeed there is no reason to doubt that at this early age he was the first cotton-spinner in England, a position entirely due to his own capacity and knowledge of the trade. In 1794 or 1795 he became manager and one of the partners of the Cheesburn Textile Company, at Manchester. During a visit to Glasgow he had fallen in love with the daughter of the proprietor of the New Lanark mills, David Dale. Owen induced his partners to purchase New Lanark; and after his marriage with Miss Dale he settled there, as manager and part owner of the mills (1800). Encouraged by his great success in the management of cotton factories in Manchester, he had already formed the intention of conducting New Lanark on higher principles than the current commercial ones.

The factory of New Lanark had been started in 1784 by Dale and Arkwright, the water-power afforded by the falls of the Clyde being the great attraction. Connected with the mills were about two thousand people, five hundred of whom were children, brought, most of them, at the age of five or six from the poorhouses and charities of Edinburgh and Glasgow. The children especially had been well treated by Dale, but the general condition of the people was very unsatisfactory. Many of them were the lowest of the population, the respectable country people preferring to submit to the long hours and demoralizing drudgery of the factories; theft, drunkenness, and other vices were common; education and sanitation were alike neglected; most families
lived only in one room. It was this population, thus committed to his care, which Owen now set himself to elevate and ameliorate. He greatly improved their houses, and by the unsparing and beneficent exertion of his personal influence trained them to habits of order, cleanliness and thrift. He opened a store, where the people could buy goods of the soundest quality at little more than cost price; and the sale of drink was placed under the strictest supervision. His greatest success, however, was in the education of the young, to which he devoted special attention. He was the founder of infant schools in Great Britain; and, though he was anticipated by reformers on the continent of Europe, he seems to have been led to institute them by his own views of what education ought to be, and without hint from abroad. In all these plans Owen obtained the most gratifying success. Though at first regarded with suspicion as a stranger, he soon won the confidence of his people. The mills continued to be a great commercial success, but it is needless to say that some of Owen's schemes involved considerable expense, which was displeasing to his partners. Tired at last of the restrictions imposed on him by men who wished to conduct the business on the ordinary principles, Owen formed a new firm, who, content with 5% of return for their capital, were ready to give freer scope to his philanthropy (1813). In this firm Jeremy Bentham and the well-known Quaker, William Allen, were partners. In the same year Owen first appeared as an author of essays, in which he expounded the principles on which his system of educational philanthropy was based. From an early age he had lost all belief in the prevailing forms of religion, and had thought out a creed for himself, which he considered an entirely new and original discovery. The chief points in this philosophy were that man's character is made not by him but for him; that it has been formed by circumstances over which he had no control; that he is not a proper subject either of praise or blame,—these principles leading up to the practical conclusion that the great secret in the right formation of man's character is to place him under the proper influences—physical, moral and social—from his earliest years. These principles—of the irrepressibility of man and of the effect of early influences—are the keynote of Owen's whole system of education and social amelioration. As we have said, they are embodied in his first work, *A New View of Society, or Essays on the Principle of the Formation of the Human Character*, the first of these essays (there are four in all) being published in 1813. It is needless to say that Owen's new views theoretically belong to a very old system of philosophy, and that his originality is to be found only in his benevolent application of them. For the next few years Owen's work at New Lanark continued to have a national and even a European significance. His schemes for the education of his workpeople attained to something like completion on the opening of the institution at New Lanark in 1816. He was a zealous supporter of the factory legislation resulting in the act of 1819, which, however, greatly disappointed him. He had interviews and communications with the leading men of government, the four Macclesfield and Manchester MPs, with other leaders and leading statesmen of Europe. New Lanark itself became a much-frequented place of pilgrimage for social reformers, statesmen, and royal personages, including Nicholas, afterwards emperor of Russia. According to the unanimous testimony of all who visited it, the results achieved by Owen were singularly good. The manners of the children, brought up under his system, were beautifully graceful, genial and unconstrained; health, plenty, and contentment prevailed; drunkenness was almost unknown, and illegitimacy was extremely rare. The most perfect good feeling subsisted between Owen and his workpeople, and all the operations of the mill proceeded with the utmost smoothness and regularity; and the business was a great commercial success.

Hitherto Owen's work had been that of a philanthropist, whose great distinction was the originality and unwearying unselfishness of his methods. His first departure in socialism took place in 1817, and was embodied in a report communicated to the committee of the House of Commons on the poor law. The general misery and stagnation of trade consequent on the termination of the great war was engrossing the attention of the country. After clearly tracing the special causes connected with the war which had led to such a deplorable state of things, Owen pointed out that the permanent cause of distress was to be found in the competition of human labour with machinery, and that the only effective remedy was the united action of men, and the subordination of machinery. His proposals for the treatment of pauperism were based on these principles. He recommended that communities of about twelve hundred persons each should be settled on quantities of land from 1000 to 1500 acres, all living in one large building in the form of a square, with public kitchen and mess-rooms. Each family should have its own private apartments, and the entire care of the children till the age of three, after which they should be brought up by the community, their parents having access to them at meals and all other proper times. These communities might be established by individuals, by parishes, by counties, or by the state; in every case there should be effective supervision by duly qualified persons. Work, and the enjoyment of its results, should be in common. The size of his community was no doubt partly suggested by his village of New Lanark; and he soon proceeded to advocate such a scheme as the best form for the reorganization of society in general. In its fully developed form—and it cannot be said to have changed much during Owen's lifetime—it was as follows. He considered an association of from 500 to 3000 as the fit number for a good working community. While mainly agricultural, it should possess all the best machinery, should offer every variety of employment, and should, as far as possible, be self-contained. "As these townsships," as he also called them, "should increase in number, unions of them federatively united shall be formed in circles of tens, hundreds and thousands," till they should embrace the whole world in a common interest.

His plans for the cure of pauperism were received with great favour. *The Times* and the *Morning Post* and many of the leading men of the country countenanced them; one of his most steadfast friends was the Duke of Kent, father of Queen Victoria. He had indeed gained the ear of the country, and had the prospect before him of a great career as a social reformer, when he went out of his way at a large meeting in London to declare his hostility to all the received forms of religion. After this defiance to the religious sentiment of the country, Owen's theories were in the popular mind associated with infidelity, and were henceforward suspected and discredited. Owen's own confidence, however, remained unshaken; and he was anxious that his scheme for establishing a community should be tested. At last, in 1825, such an experiment was attempted under the direction of his disciple, Abram Combe, at Orbiston near Glasgow; and in the next year Owen himself commenced another at New Harmony (q.v.), Indiana, U.S.A. After a trial of about two years both failed completely. Neither of them was a pauper experiment; but it must be said that the members were of the most motley description, many worthy people of the highest aims and feelings, with vice and crotchety, wrong-headed enthusiasts. After a long period of friction with William Allen and some of his other partners, Owen resigned all connexion with New Lanark in 1828. On his return from America he made London the centre of his activity. Most of his means having been sunk in the New Harmony experiment, he was no longer a flourishing capitalist, but the head of a vigorous propaganda, in which socialism and secularism were combined. One of the most interesting features of the movement at this period was the establishment in 1832 of an equitable labour exchange system, in which exchange was effected by means of labour notes, the usual means of exchange and the usual middlemen being alike superseded. The word "socialism" first became current in the discussions of the Association of All Classes of All Nations, formed by Owen in 1835. During these years also his secularistic teaching gained such influence among the working classes as to give occasion for the statement in the *Westminster Review* (1830) that his principles were the actual creed of a great portion of them. His views on marriage, which were certainly lax, gave
just ground for offence. At this period some more communicative experiments were made, of which the most important were that at Kallahi, in the county of Clare, Ireland, and that at Tytherley in Hampshire. It is allowed that the former (1831) was a remarkable success for three and a half years, till the proprietor, having ruined himself by gambling, was obliged to sell out. Tytherley, begun in 1839, was an absolute failure. By 1846 the only permanent result of Owen's agitation, so zealously carried on by public meetings, pamphlets, periodicals, and occasional treatises, was the co-operative movement, and for the time even that seemed to have utterly collapsed. In his later years Owen became a firm believer in spiritualism. He died at his native town on the 17th of November 1838.

Owen left four sons, Robert Dale, William, David Dale and Richard, all of whom became citizens of the United States. ROBERT DALE OWEN, the eldest (1801-1877), was for long an able exponent in his adopted country of his father's doctrines. In 1836-39 and 1851-52 he was a member of the Indiana House of Representatives and in 1844-47 was a Representative in Congress, where he drafted the bill for the founding of the Smithsonian Institution. He was a member of the Indiana Constitutional Convention, and was instrumental in securing the admission of widows and married women control of their property, and the adoption of a common free school system. He later succeeded in passing a state law giving greater freedom in divorce. From 1853 to 1858 he was United States minister at Naples. He was a strong believer in spiritualism and was the author of two well-known books on the subject: Footfalls on the Boundary of Another World (1859) and The Debatabale Land Between this World and the Next (1872). Owen's third son, DAVID DAELE OWEN (1807-1860), in 1839 appointed a United States geologist, and made extensive surveys of the north-west, which were published by order of Congress. His youngest son, RICHARD OWEN (1810-1890), was a professor of natural science in Nashville University.

Of R. Owen's numerous works in exposition of his system, the most important are the New View of Society; the Report communicated to the Committee on the Poor Law; the Book of the New Moral World; and Revolution in the Mind and Practice of the Human Race. See Life of Robert Owen written by himself (London, 1857), and Threading my Way, Twenty-seven Years of Autobiography, by Robert Dale Owen (London, 1874). There are also Lines of Owen by A. J. Booth (London, 1861), V. L. Sargent (London, 1860), Lloyd Jones (London, 1889), F. A. Packard (Philadelphia, 1866) and F. Podmore (London, 1906). See also H. H. Read, Robert Owen: sein Leben und Wirken (Leipzig, 1885), and E. D. Lollans, Robert Owen (Paris, 1905); G. J. Holyoke, History of Co-operation in England (London, 1906); and the article COMMUNISM. OWENS, JOHN (1796-1846), English merchant, was born at Manchester in 1790, the son of a prosperous merchant. Early in life he became a partner in his father's business and was soon noted for his ability as a cotton buyer. His business prospered, and the firm traded with China, India, South America and the United States, dealing in many other commodities. His large fortune he suggested leaving to his friend and partner George Faulkner (1790-1860), alight a rich man. But by the latter's advice, he founded the Manchester School of Design, Manchester, opened 1851, now part of Victoria University, based upon his own ideas of education. He died in Manchester on the 29th of July 1846. His bequests to friends and charities amounted to some £5,000,000, while for the college he left £56,545. Among the conditions for its foundation the most important was that which disheutened any sort of religious test for students or teachers.

OWENSBOO, a city and the county-seat of Daviess county, Kentucky, U.S.A., on the Ohio river, 112 m. by rail W.S.W. of Louisville. Pop. (1890) 9,637; (1900) 13,180, of whom 3,061 were negroes; (1910 census) 16,011. The city is served by the Illinois Central, the Louisville & Nashville, and the Louisville, Henderson & St Louis railways, and by steamboat lines to river ports. At Owensboro are the Owensboro College for women (non-sect.), opened in 1890, Saint Francis Academy, and a Roman Catholic school for boys. Two miles S. of the city is Hickman Park (20 acres), a pleasure resort, and E. of the city is a summer Chautauqua park. Owensboro is situated in a good agricultural region; coal, iron, building stone, clay, oil, lead and zinc abound in the vicinity; and the city has a notably large trade in tobacco (especially strip tobacco) and has various manufactures. The value of the city's factory products increased from $1,740,128 in 1900 to $4,187,700 in 1905, or 140-6%. The municipality owns and operates its electric-lighting plant and water-works. Owensboro was settled about 1798, and for several years was commonly known as Yellow Banks; in 1816 it was laid out as a town and named Rosseborough, and two years later the present name was adopted in honour of Colonel Abraham Owen (1769-1811), a Virginian who removed to Kentucky in 1785, served in several Indian campaigns, and was killed in the battle of Tippecanoe. Owensboro was incorporated as a city in 1866.

OWEN SOUND, a town and port of entry in Ontario, Canada, and capital of Grey county, situated 99 m. N.W. of Toronto, on Georgian Bay. Pop. (1901) 5796. It is the terminus of branches of the Canadian Pacific and Grand Trunk railroads, and of the Canadian Pacific and other steamship lines plying to ports on Lakes Huron and Superior. Its harbour is one of the best on Lake Huron, and navigable by lake vessels of the largest size. It is a flourishing town, containing shipbuilding yards, and manufactories of mill machinery, agricultural implements, furniture and sewing-machines, flour-mills, saw-mills and large grain elevators.

OWL (O. Eng. Æle, Swe. ugga, Ger. Eule—all all to Lat. Ulula, and evidently of imitative origin), the general English name for every nocturnal bird of prey, of which group nearly two hundred species have been recognized. The owls form a very natural assemblage, and one about the limits of which no doubt has for a long while existed. They were formerly placed with the Accipiters or diurnal birds of prey, but are now known to belong to a different group of birds, and are placed as a suborder Striges of Coraciiform birds, their nearest allies being the goatsuckers. The subdivision of the group has always been a fruitful matter of discussion, owing to the great resemblance obtaining among all its members, and the existence of safe characters for its division has only lately been at all generally recognized. By the older naturalists, it is true, owls were divided, as was first done by F. Willughby, into two sections—one in which all the species exhibit tufts of feathers on the head, the so-called "ears" or "horns," and the second in which the head is not tufted. The artificial and therefore untrustworthy nature of this distinction was shown by Isidore Geoffroy St-Hilaire (Ann. Sc. Natuerelles, xxi. 194-203) in 1803. The later work of C. L. Nitzsch on pterylography and of A. Milne-Edwards on osteology has led to a division of the family Strigidae into the sub-families Striginae, in which the unnotched sternum has its broad keel joined to the furcula, and Buhoineae, in which the sternum is notched posteriorly, the clavicles do not always meet to form a furcula, nor meet the sternum. The Striginae contain the screech- or barn-owls (Strix) and the partly intermediate Heliodius of Madagascar, whilst all the other genera are now placed with the Buhoineae. Among owls are those which are furnished with a bill 5 in. as Glaucidium cuculense, which is therefore much smaller than a skylark, or more than 2 ft., a size that is attained by many species. Their plumage, none of the feathers of which possesses an afterhaft, is of the softest kind, rendering their flight almost noiseless. But one of the most characteristic features of this whole group is the ruff, consisting of several rows of short and very curved feathers with stiff shafts—originating from a fold of the skin, which begins on each side of the base of the neck, runs above the eyes, and passing downwards round and behind the ears turns forward, and ends at the chin—and serving to support the longer feathers of the "disk" or space immediately around the eyes, which extend over it. A considerable number of species of owls, belonging to various genera, and natives of countries most widely separated, are remarkable for exhibiting two phases of coloration—one in which the prevalent browns have a more or less rusty-red tinge, and the other in which they incline to grey. Another characteristic of
owls is the reversible property of their outer toes, which are when perching quite backwards. Many forms have the legs and toes thickly clothed to the very claws; others have the toes, and even the tarsi, bare, or only sparsely beset by bristles. Among the bare-legged owls those of the Indian *Ketupa* are conspicuous, and this feature is usually correlated with their fish-catching habits; but certainly other owls that are not known to catch fish present much the same character.

Among the multitude of owls there is only room here to make further mention of a few of the more interesting. First must be noticed the tawny owl—the *Strix aluco* of some authors, the *chat-huant* of the French, the species whose tremulous hooting "tu-whit, tu-who," has been celebrated by Shakespeare, and, as well as the plaintive "call," "keewick," of the young after leaving the nest, will be familiar sounds to many readers, for the bird is very generally distributed throughout most parts of Europe, extending its range through Asia Minor to Palestine, and also to Barbary—but not belonging to the Ethiopian Region or to the eastern half of the Palaearctic. It is the largest of the species indigenous to Britain, and is strictly a woodland bird, only occasionally choosing any other place for its nest than a hollow tree. Its food consists almost entirely of small mammals, chiefly rodents; but, though on this account most deserving of protection from all classes, it is subject to the stupid persecution of the ignorant, and is rapidly declining in numbers. Its nearest allies in North America are the *S. nebulosa*, with some kindred forms, one of which, the *S. occidentalis* of California and Arizona, is figured above; but none of them seem to have the "merry note" that is uttered by the European species. Common to the most northerly forest-tracts of both continents (for, though a slight difference of coloration is observable between American examples and those from the Old World, it is impossible to consider it specific) is the much larger *S. cinerea* or *S. lapponica*, whose iron-grey plumage, delicately mottled with dark brown, and the concentric circles of its facial disks make it one of the most remarkable of the group. Then may be noticed the genus *Bubo*—containing several species

1 All owls have the habit of casting up the indigestible parts of the food swallowed in the form of pellets, which may often be found in abundance under the owl-roost, and reveal without any manner of doubt what the prey of the birds has been. The result in nearly every case shows the enormous service they render to man in destroying rats and mice. Details of many observations to this effect are recorded in the *Bericht über die X. Versammlung der Deutschen Ornithologen-Gesellschaft* (pp. 30-34).

2 This species bears confinement very well, and propagates freely therein. To it belong the historic owls of Arundel Castle.

3 See the remarks of Mr Ridgway in the work before quoted (B. N. America, iii. 9, 10), where also response is made to the observations of Mr Allen in the Harvard Bulletin (ii. 338, 339).
cease to wonder at its having been seriously selected as the symbol of learning, and can hardly divest themselves of a suspicion that the choice must have been made in the spirit of sarcasm. This little owl (for that is its only name—though it is not even the smallest that appears in England), the chenêche of the French, is spread throughout the greater part of Europe, but it is not a native of Britain. It has a congener in C. brama, a bird well known to all residents in India.

Finally, we have owls of the second section, those allied to the screech-owl, Strix flammea, the Efrau of the French. This, with its discordant scream, its snoring, and its hissing, is far too well known to need description, for it is one of the most widely-spread of birds, and is the owl that has the greatest geographical range, inhabiting almost every country in the world—Sweden and Norway, America north of lat. 45°, and New Zealand being the principal exceptions. It varies, however, not inconsiderably, both in size and intensity of colour, and several ornithologists have tried to found on these variations more than half-a-dozen distinct species. Some, if not most of them, seem, however, hardly worthy to be considered geographical races, for their differences do not always depend on locality. R. Bowdler Sharpe, with much labour and in great detail, has given his reasons (Cat. B. Brit. Museum, ii. 291-309; and Ornith. Miscellany, i. 269-298; ii. 1-21) for acknowledging four “subspecies” of S. flammea, as well as five other species. Of these last, S. tenobiliosus is peculiar to Australia, while S. nova-hollandiae inhabits also New Guinea, and has a “subspecies,” S. castanops, found only in Tasmania; a third, S. candida, has a wide range from Fiji and northern Australia through the Philippines and Formosa to China, Burmah and India; a fourth, S. capensis, is peculiar to South Africa; while S. thomensis is said to be confined to the African island of St. Thomas. To these may perhaps have to be added a species from New Britain, described by Count Salvadori as Strix aurantia, but it may possibly prove on further investigation to not be a strige owl at all.  

**OWLING—OX**

OWL, in English law, the offence of transporting wool or sheep out of the kingdom, to the detriment of the staple manufacture of wool. The name is said to owe its origin to the fact that the offence was usually carried on at night-time, when the wool were abroad. The offence was stringently regulated by a statute of Edward III. (1336-7), while many subsequent statutes also dealt with it. In 1566 the offence was made punishable by the cutting off of the left hand and nailing it in a public place. By a statute of 1660 the ship and cargo were to be forfeited. In the reign of George I. (1717-1728) the penalty was altered to transportation for seven years. The offence was abolished in 1824.

**OWSOSSO,** a city of Shiawassee county, Michigan, U.S.A., on Shiawassee river, about 79 m. N.W. of Detroit and 28 m. N.E. of Lansing. Pop. (1900) 8690, of whom 1396 were foreign-born; (1910 census) 9639. It is served by the Michigan Central, the Grand Trunk, and the Ann Arbor railways, and is a division point of the last. It is situated in the coal area of Michigan, and has various manufactures, including beet-sugar, for which Owosso is an important centre. The value of the city’s factory products increased from $2,055,022 in 1900 to $3,100,232 in 1905, or 51.3%. The municipality owns and operates its water-works. Owosso was settled about 1834 and chartered as a city in 1859.

OX, strictly speaking, the Saxon name for the males of domesticated cattle (Bos taurus), but in a zoological sense employed so as to include not only the extinct wild ox of Europe but likewise bovine animals of every description, that is to say true oxen, bison and buffaloes. The characteristics of the sub-family Bovinae, or typical section of the family Bovidae, are given in the article Bovidae (q.v.); for the systematic position of that family see Fecora.

In the typical oxen, as represented by the existing domesticated breeds (see CATTLE) and the extinct aurochs (q.v.), the horns are cylindrical and placed on an elevated crest at the very rear of the skull, which has the frontal region of great length. The aurochs was a black, large, animal, with a lighter dorsal streak, and horns directed upwards in the shape of a pitchfork, black at their tips, but otherwise whitish. The fighting bulls of Spain, the black Pembroke cattle of Wales, with their derivatives the white park-cattle of Chillingham in Northumberland, are undoubtedly the direct descendants of the aurochs. The black Kerry breed and the black or brown Scotch cattle are also more or less nearly related; and a similar kinship is claimed for the Semental cattle of Switzerland, although their colour is white and fawn. Short-horns are a modern derivative from cattle of the same general type. Among other British breeds may be mentioned the Devons and Herefords, both characterized by their red colour; the long-horned and Sussex breeds, both with very large horns, showing a tendency to grow downwards; and the Ayrshire. Polled, or hornless, breeds, such as the polled Angus and polled Suffolk, are of interest, as showing how easily the horns can be eliminated, and thus indicating a hornless ancestry. The white cattle formerly kept at Chartley Park, Staffordshire, exhibit signs of affinity with the long-horned breed. The Channel Island cattle, which are either black or fawn, would seem to be nearly allied to the Spanish fighting breed, and thus to the aurochs. The great white or cream-colored cattle of Italy, Austria, Hungary and Poland, which have very long black-tipped horns, are also probably not far removed from the aurochs stock.

On the other hand, the great tawny draught cattle of Spain seem to indicate mixture with a different stock, the horns having a double curvature, quite different from the single one of the aurochs type. There are reports as to these cattle having been formerly crossed with the humped eastern species; and their characteristics are all in favour of such an origin. Humped cattle are widely spread over Africa, Madagascar and India, and form a distinct species, Bos indicus, characterized by the presence of a fleshy hump on the shoulders, the convexity (instead of concavity) of the first part of the curve of the horns, the very large size of the dewlap, and the general presence of white rings round the fetlocks, and light circles surrounding the eyes. The voice and habits of these cattle are also markedly different from those of European cattle. Whether humped cattle are of Indian or African origin cannot be determined, and the species is known only in the domesticated condition. The largest horns are found in the Galla cattle, in which they attain enormous dimensions. In Europe the name zebu is generally applied to the Indian breed, although no such designation is known in India itself.

A third type is apparently indicated by the ancient Egyptian cattle, which were not humped, and for which the name Bos aegyptiacus has been suggested. The cattle of Ankole, on the Uganda frontier, which have immense horns, conform to this type.

A second group of the genus Bos is represented by the Indo-Malaysian cattle included in the sub-genus Bibos (see Bantin, Gaur and Gavall); they are characterized by the more or less marked flattening of the horns, the presence of a well-marked ridge on the anterior half of the back, and the white legs.

---

1 Through the dialectic forms Pesseia and Pesseia, the origin of the word is easily traced to the Latin praesago—a bird of bad omen; but it has also been confounded with Orfase, a name of the Osprey (q.v.).
More distinct are the bisons, forming the sub-genus Bison, represented by the European and the American species (see Bison). The skull is of the skull being much shorter and wider, and the horns not arising from a crest on the extreme vertex, while the number of ribs is different (14 pairs in bisons, only 13 in oxen), and the hair on the head and neck is long and shaggy.

Very close to this group, if indeed really separable, is the Tibetan yak (q.v.), forming by itself the sub-genus Poephagus.

The most widely different from the true oxen are, however, the buffaloes (see Buffalo), which have consequently the most claim to generic distinction. From all other Bosinae they differ by the triangular section of their horns. They are divisible into two groups, an African and an Asiatic, both of which are generally included in the sub-genus, or genus, Bubalus, although the latter are sometimes separated as Buffalo. The smallest member of the group is the ox (q.v.) of Celebes.

As regards the origin of the ox-tribe we are still in the dark. The structure of their molar teeth affirms them to the antelopes of the Oryx and Hiphotragus groups; but the early bovines lack horns in the female, whereas both sexes of these antelopes are horned.

Remains of the wild ox or aurochs are abundant in the superficial deposits of Europe, Western Asia, and Northern Africa; those from the brick-earths of the Thames valley indicating animals of immense proportions. Side by side with these are found remains of a buffalo, specifically distinct from the living European animal and termed Bos (Bison) priscus. In the Pleistocene of India occurs a large ox (Bos nasimicus), possibly showing some affinity with the Bisons group, and in the same formation are found remains of a buffalo, allied to, but distinct from, the living Indian species. Large oxen also occur in the Lower Pliocene of India, although not closely allied to the living kinds; while in the same formation are found remains of bisons (or [?] yak) and buffaloes, some of the latter being nearly akin to the anoa, although much larger. Perhaps, however, the most interesting are the remains of certain oxen from the Lower Pliocene of Europe and India, which have been described under the sub-generic (or generic) title of Leptobos, and are characterized by the absence of horns in the female. In other respects they appear to come nearest to the lantian. Remains of extinct bisons, some of gigantic size, occur in the superficial formations of North America as far south as Texas. See R. Lydekker, _Wild Oxen, Sheep and Goats._

**OXALIC ACID,** $H_2C_2O_4 \cdot 2H_2O$, one of the oldest known organic acids. Scheele prepared it by oxidizing sugar with nitric acid, and showed it to be identical with the acetic acid obtained from wood-sorrel. It is found in the form of its acid potassium salt in many plants, especially in wood-sorrel (Optilis acetosella) and in Rumex; as ammonium salt in guano; as calcium salt in rhubarb root, in various lichens and in plant cells; as sodium salt in species of Salicornia and as free acid in varieties of Boletus. It is also present in urine and in urinary calculi. It is formed in the oxidation of many organic compounds (e.g. sugar, starch and cellulose) by nitric acid, and also by the fusion of many oxygen-holding compounds with caustic alkalis, this latter method being employed for the manufacture of oxalic acid.

In this process cellulose (in the form of sawdust) is made into a stiff paste with a mixture of strong caustic potash and soda solution and heated in flat iron pans to 200-250°C. The somewhat dark-coloured mass is lixiviated with a small amount of warm water in order to remove excess of alkali, the residual alkaline oxalates converted into insoluble carbonates by boiling with milk of lime, the lime salt separated, and decomposed by means of sulphuric acid. It is found that the sawdust obtained from soft woods is the best material for use in this process. It may be obtained synthetically by heating sodium in a current of carbon dioxide to 360°C; by the oxidation of ethylene glycol; by heating sodium formate to 400°C (V. Merz and W. Weith, _Ber._, 1882, 15, p. 1553), and by the spontaneous hydrolysis of an aqueous solution of cyanogen gas.

The hydrated acid crystallizes in prisms which effloresce in air, and are readily soluble in water. It loses its water of crystallization at 100°C, and begins to sublime at about 150-160°C., whilst on heating to a still higher temperature it partially decomposes into carbon dioxide and formic acid, or into carbon dioxide, water and the latter decomposition being also brought about by heating oxalic acid with concentrated sulphuric acid. The anhydrous acid melts at 189-95°C. (E. Bamberger, _Ber._, 1888, 21, p. 103) and is frequently used as a condensing agent. Phosphorus pentachloride decomposes it into carbon monoxide and dioxide, the reaction being the one generally applied for the purpose of preparing phosphorus oxychloride. When heated with glycerin to 100°C it yields formic acid and carbon dioxide; above this temperature, allyl alcohol is formed. Nascent hydrogen reduces it to glycolic acid. Potassium permanganate in acid solution oxidizes it to carbon dioxide and water; the manganese sulphate formed has a catalytic accelerating effect on the decomposition.

Oxalic acid is very poisonous, and by reason of its great similarity in appearance to Epsoms salts, it has been very frequently mistaken for this substance with, in many cases, fatal results. The antitoxins for oxalic acid poisoning are milk of lime, chalk, whiting, or even wall-plaster, followed by evacuation brought about by an emema or castor oil. Only the salts of the alkal metals are soluble in water. Beside the ordinary acid and neutral salts, a series of salts called quadoxalates is known, these being salts containing one molecule of acid salt, in contrast with the previously known ammonium being "salt of sorrel," $KHC_2O_4 \cdot H_2O \cdot 2H_2O$. Oxalates are readily decomposed on heating, leaving a residue of carbonate, or oxide of the metal. The silver salt decomposes with explosive violence, leaving a residue of the metal.

Potassium ferrous oxalate, $FeK(C_2O_4) \cdot H_2O$, is a strong reducing agent and is used as a photographic developer. Potassium ferric oxalate, $K_2Fe(C_2O_4) \cdot 2H_2O$, is used in the preparation of pentroxylics, or oxalates of the most acid, which are used in the preparation of potassium ferrocyanide, $K_2[Fe(CN)_4]$. A light, $2FeK(C_2O_4) \cdot 2Fe(C_2O_4) \cdot K_2C_2O_4 \cdot 2CO_2 \cdot 2H_2O$. Ethyl oxalate, (CO-OC-H$_2$)$_2$, prepared by boiling anhydrous oxalic acid with absolute alcohol, is a colourless liquid which boils at 185°C. Methyl oxalate, HO-C-COOCH$_3$, melts at 70°C, has been observed to produce phosphorus pentachloride and ethyl chloride. Oxamic acid, HO-C-CO-NH$_2$, is obtained from heat acid ammonium oxalate; by boiling oxamide with ammonia; and among the products produced when amino-acids are oxidized with potassium permanganate (J. T. Halsey, _Zent. f. physiol. Chem._, 1898, p. 532). It is a crystalline powder difficultly soluble in water and melting at 210°C. (with decomposition). Its ethyl ester, known as oxamate, crystallizes in rhombic plates which melt at 114-115°C. In water pentachloride is formed, the ethyl oxamyl chloride first formed being unstable: ROOC-CONH$_2$ $\rightarrow$ ROOC-C(=Cl)-NH$_2$ $\rightarrow$ CN-COOH. Oxime, [CO$_2$]-NH$_2$, produced by the action of a mixture of phosphorus pentachloride and oxochloride of phosphorus on the amide of acetic acid ($H_2N-CO-NH$_2$), crystallizes in prisms, and when boiled with water is readily hydrolysed to oxamide and oxalic acid. Oxamide, (CONH$_2$)$_2$, is best prepared by the action of ammonia on the esters of oxalic acid. It is also obtained by the action of hydrocyanic acid on hydroxy-acetic acid, or of manganese dioxide and sulphuric acid on potassium cyanide. It is a white crystalline powder which is almost insoluble in cold water. It melts at 417-419°C. (with decomposition) when warmed (O. Michael, _Ber._, 1895, 28, p. 1532). When heated with phosphorus pentoxide it yields cyanogen. It is readily hydrolysed by hot solutions of the caustic alkalis. Substituted oxamides are produced by the action of primary amines on ethyl oxamate. Oxalamide, (CONH$_2$)$_2$, has been prepared by the action of hydrazine hydroxide on oxamethane (W. Kepf and K. Unger, _Ber._, 1897, 30, p. 586). It crystallizes in plates which melt at 220-221°C. (with decomposition). It is only slightly soluble in water, readily soluble in acids and alkalis. It reduces silver salts rapidly. It contains with aldehydes and ketones to produce semioxamazons.

**OXALIS,** in botany, a large genus of small herbaceous plants, comprising, with a few small allied genera, the natural order Oxalidaceae. The name is derived from Gr. ὀξαλος, acid, the plants being acid from presence of acid calcium oxalate. It contains about 220 species, chiefly South African and tropical and South American. It is represented in Britain by the wood-sorrel, a small stemless plant with radical trefoil-like leaves growing from a creeping scaly rootstock, and the flowers borne singly on an axillary stalk; the flowers are regular with five sepals, five obovate, white, purple-veined, free petals, ten stamens and a central five-lobed, five-celled ovary with five
free styles. The fruit is a capsule, splitting by valves; the seeds have a fleshy coat, which curls back clasticly, ejecting the true seed. The leaves, as in the other species of the genus, show a “sleep-movement,” becoming pendulous at night.

*Oxalis crenata*, Oca of the South Americans, is a tuberous-rooted half-hardy perennial, native of Peru. Its tubers are comparatively small, and somewhat acid; but if they be exposed in the sun from six to ten days they become sweet and floury. In the climate of England they can only be grown by starting them in heat in March, and planting out in June in a light soil and warm situation. They grow freely enough, but few tubers are formed, and these of small size. The fleshy stalks, which have the acid flavour of the family, may, however, be used in the same way as rhubarb for tarts. The leaves may be eaten in salads. It is easily propagated by cuttings of the stems or by means of sets like the potato.

*Oxalis Deppei* or *O. tetraphylla*, a bulbous perennial, native of Mexico, has small bulbs from which are produced fleshy, tapering, white, semi-transparent roots, about 4 in. in length and 3 to 4 in. in diameter. They strike down into the soil, which should therefore be made light and rich with abundance of decayed vegetable matter. The bulbs should be planted about the end of April, 6 in. apart, in rows 1 ft. distant, being only just covered with soil and having a situation with a southern aspect. The roots should be dug up before they become affected by frost, but if protected they will continue to increase in size till November. When taken up the bulbs should be stored in a cool dry place for replanting and the roots for use. The roots are gently boiled with salt and water, poled and eaten like parcooked with melted butter and the yolks of eggs, or served up like salisly and scorzonera with white sauce.

Many other species are known in cultivation for edgings, rockwork or as pot-plants for the greenhouse, the best hardy and half-hardy kinds being *O. arenae*, purple; *O. Boweri*, crimson; *O. ennea-phylia*, white or pale rose; *O. floridulosa*, rose; *O. lasiandra*, pink; *O. baccata*, creamy yellow; *O. variatissima*, purple, white, red, and *O. violacea*, violet.

**OXAZOLES**, a group of organic compounds containing a ring complex (shown below) composed of three carbon atoms, and one oxygen and one nitrogen atom; they are isomeric with the isoxazoles (q.v.). They are obtained by condensing a halogen derivatives of ketones with amide-amines (M. Lewy, *Ber.*, 1887, 20, p. 2576; 1888, 21, p. 2195)

\[
\begin{align*}
R-\overset{\text{NH}}{\underset{\text{OC}}{\text{C}}} & -R' \overset{\text{Br}}{\underset{\text{CH}}{\text{C}}} & = & R-\overset{\text{N}}{\underset{\text{CH}}{\text{C}}}\\
\text{by the action of concentrated sulphuric acid on nitriles and benzoin (F. Japp, *Jour. Chem. Soc.* 1883, 63, p. 465) and by passing hydrochloric acid gas into a mixture of aromatic aldehydes and their cyanhydrins (E. Fischer, *Ber.*, 1896, 29, p. 205).}
\end{align*}
\]

They are weak bases, and the ring system is readily split by evaporation with hydrochloric acid, or by the action of reducing and oxidizing agents.

The dihydro-oxazoles or oxazolines are similarly formed when \(\beta\)-halogen alkyl amides are condensed with alkali (S. Gabriel, *Ber.*, 1889, 22, p. 2220), or by the action of alkali on the compounds formed by the interaction of ethylene chlorhydrin on nitriles. They are strong bases characterized by a quinoline-like smell. The amino-oxazolines are known as alkylene-\(\beta\)-amides and are formed by the action of potassium cyanate on the hydrobromides of the bromalkylamines (S. Gabriel, *Ber.*, 1895, 28, p. 1890). They are strong bases. The oxazolines result from the action of aldehydes on amino-alcohols (L. Knoer, *Jour.*, 1901, 34, p. 3348). The above types of compounds may be represented by the following formulae:

\[
\begin{align*}
N = CH-CH(OH)-CH=CH-CH=CH(CH=CH)_n-CH=CH(OH)-CH=CH-CH=CH-n+1-CH-CO-NH-CH_2-
\end{align*}
\]

The hexasoxazoles are formed when ortho-aminophenolamines are condensed with organic acids (A. Ladenburg, *Ber.*, 1876, 9, p. 1524; 1877, 10, p. 1113), or by heating aldehydes and ortho-aminophenolamines to high temperature (G. Mazzara and A. Leonard, *Gazz.*, 1871, 21, p. 251). They are mostly yellow crystalline solids which distil unchanged. When warmed with acids they split into their components. They behave as weak bases. By the condensation of ortho-aminophenolamines with phosgene or thiophosgene, oxy- and thio-derivatives are obtained, the (OH) and (SH) groups being situated in the \(\alpha\) position, and these compounds on treatment with amines yield amino derivatives.

**Oxe, Peder** (1530–1575), Danish Finance Minister, was born in 1530. At the age of twelve he was sent abroad to complete his education, and resided at the principal universities of Germany, Holland, France, Italy and Switzerland for seventeen years. On his return he found both his parents dead, and was appointed the guardian of his eleven young brothers and sisters, in which capacity, profiting by the splendour of the church, strike down into their scalps and crowns. His extraordinary financial abilities and pronounced political capacity soon found ample scope in public life. In 1552 he was raised to the dignity of Rigraad (councillor of state); in 1554 he successfully accomplished his first diplomatic mission, by adjusting the differences between the elector of Saxony and the margrave of Brandenburg. The same year he held the post of governor of Copenhagen and shared with Byrge Trolle the control of the treasury. A few years later he incurred the royal disfavour for gross malversation in the administration of public property, and failing to compromise matters with the king, fled to Germany and engaged in political intrigues with the adventurer Wilhelm von Grumbach (1503–1567) for the purpose of dethroning Frederick II. in favour of Christina of Lorraine, the daughter of Christian II. But the financial difficulties of Frederick II. during the stress of the Scanian War (1558–1559) forced War compiled him, in 1556, to recall the great financier, whose modesty was restored to him and he was reinstated in all his offices and dignities. A change for the better immediately ensued. The finances were speedily put on an excellent footing, means were provided for carrying on the war to a successful issue (one of the chief expediens being the raising of the Sound tolls) and on the conclusion of peace Oxe, as lord treasurer, not only restored the national debt considerably, but redeemed a large portion of the alienated crown-lands. He reformed the coinage, developed trade and commerce and introduced numerous agricultural reforms, especially on his own estates, which he was never weary of enlarging, so that on his death he was the wealthiest landowner in Denmark. Oxe died on the 24th of October 1575, at the age of sixty, in the prime of life, and was succeeded by his great financial abilities, and was raised to the rank of a great power.

See P. Oxe’s *liv och leden* (Copenhagen, 1879); *Danoer rige historie*, vol. 3 (Copenhagen, 1897–1905).

**Oxenbridge, John** (1668–1747), English Nonconformist divine, was born at Daventry, Northamptonshire, on the 30th of January 1668, and was educated at Emmanuel College, Cambridge, and Magdalen Hall, Oxford (B.A. 1628, M.A. 1631). As tutor of Magdalen Hall he drew up a new code of articles referring to the government of the college. He was deprived of his office in May 1634, and began to preach, with a similar disregard for constituted authority. After his voyages to the Bermudas he returned to England (1642), and after exercising an itinerant and unattached ministry settled for some months in Great Yarmouth and then at Beverley. He was minister at Berwick-on-Tweed when in October 1652 he was appointed a fellow of Eton College. There in 1658 he preached the funeral
sermon of Francis Rous, the provost, and thence in 1660 he was ejected. He returned to his preaching at Berwick-on-Tweed, but was expelled by the Act of Uniformity in 1662, and after spending some time in the West Indies settled (1670) at Boston, Massachusetts, where he was ordained minister of the First Church. He died on the 28th of December 1674. A few sermons are all that he published. His first wife (d. 1658) was "a scholar beyond what was usual in her sex," and Andrew Marvell, who was their friend, wrote an epitaph for her tomb at Eton which was defaced at the Restoration; his second wife (d. 1659) was Frances Woodward, daughter of the famous vicar of Bray; his third was a widow whom he met at Barbados.

OXENFORD, JOHN (1812-1877). English dramatist, was born at Camberrwell on the 12th of August 1812. He began his literary career by writing on finance. He was an excellent linguist, and the author of many translations from the German, notably of Goethe's Dichtung und Wahrheit (1846) and Eckermann's Conversations of Goethe (1850). He did much by his writing to spread the fame of Schopenhauer in England. His first play was My Fellow Clerk, produced at the Lyceum in 1835. This was followed by a long series of pieces, the most famous of which was perhaps the Porter's Knot (1858) and Twice Killed (1853). About 1850 he became dramatic critic of The Times. He died in Southwark on the 21st of February 1877.

Many references to his works will be found in The Life and Reminiscences of T. L. Blanchard (ed. C. Scott and C. Howard, 1801).

OXENHAM, HENRY NUTCOMBE (1829-1888). English ecclesiologist, son of a master at Harrow, was born there on the 15th of November 1829. From Harrow he went to Balliol College, Oxford. He took Anglican orders in 1854, but became a Roman Catholic in 1857. At first his thoughts turned towards the priesthood, and he spent some time at the London Oratory and at St Edmund's College, Ware; but being unable to surrender his belief in the validity of Anglican orders, he proceeded no further than minor orders in the Roman Church. In 1863 he made a prolonged visit to Germany, where he studied the language and literature, and formed a close friendship with Döllinger, whose First Age of the Christian Church he translated in 1866. Oxenham was a regular contributor to the Saturday Review. A selection of his essays was published in Short Studies in Ecclesiastical History and Biography (1884), and Short Studies, Ethical and Religious (1885). He also translated in 1876 the 2nd vol. of Bishop Hefele's History of the Councils of the Church, and published several pamphlets on the reunion of Christendom. His Catholic Doctrine of the Atonement (1865) and Catholic Exchanges were excellent and influential works. Oxenham died at Kensington on the 23rd of March 1888.

See J. Gillow's Bibliographical Dictionary of English Catholics, vol. v. An interesting obituary notice on Oxenham was written by Vicesimus, i.e. Dean John Oakley of Manchester, for the Manchester Guardian, and published in pamphlet form (Manchester, 1888).

OXENSTJERNA, an ancient Swedish senatorial family, the origin of which can be traced up to the middle of the 14th century, when it had vast estates in Sodermanland and Uppland, and began to adopt its armorial designation of Oxenstjerna ("Ox-forehead") as a personal name towards the end of the 16th century. Its most notable members were the following.

1. COUNT AXEL GUSTAVSSON (1583-1654), chancellor of Sweden, was born at Fönd in Uppland, and was educated with his brothers at the universities of Rostock, Jena and Wittenberg. On returning home in 1603 he was appointed kammerjunker to King Charles IX. In 1606 he was entrusted with his first diplomatic mission, to Mecklenburg, was appointed a senator during his absence, and henceforth became one of the king's most trusted servants. In 1610 he was sent to Copenhagen to prevent a war with Denmark, but was unsuccessful. This embassy is important as being the beginning of Oxenstjerna's long diplomatic struggle with Sweden's traditional rival in the north, whose most formidable enemy he continued to be throughout life. Oxenstjerna was appointed a member of Gustavus Adolphus's council of regency. High aristocrat as he was, he would, however, have limited the royal power. An oligarchy guiding a limited monarchy was ever his ideal government, but the genius of the young king was not to be fettered, so Oxenstjerna was content to be the colleague instead of the master of his sovereign. On the 6th of January 1612 he was appointed chancellor. His controlling, organizing hand was speedily felt in every branch of the administration. For his services as first Swedish plenipotentiary at the peace of Knäred, 1613, he was richly rewarded. During the frequent absences of Gustavus in Livonia and Finland (1614-1616) Oxenstjerna acted as his vice-regent, when he displayed manifold abilities and an all-embracing activity. In 1620 he headed the brilliant embassage despatched to Berlin to arrange the mutual contract between Gustavus and Mary Eleanor of Brandenburg. It was his principal duty during the king's Russian and Polish wars to supply the armies and the fleets with everything necessary, including men and money. By this time he had become so indispensable that Gustavus, in 1622, bade him accompany him to Livonia, where Oxenstjerna was appointed governor-general and commandant of Riga. His services in Livonia were rewarded with four castles and the whole bishopric of Wenden. He again entered into peace negotiations with the truce with Poland in 1623, and, as mediator, was successful in averting a threatened rupture with Denmark in 1624. On the 7th of October 1626 he was appointed governor-general of the newly-acquired province of Prussia. In 1629 he concluded the very advantageous truce of Altmarch with Poland. Previously to this (September 1628) he arranged with Denmark a joint occupation of Stralsund, to prevent that important fortress from falling into the hands of the Imperialists. After the battle of Breitenfeld (September 7th, 1631) he was summoned to assist the king with his counsels and co-operation in Germany. During the king's absence in Franchecon and Bavaria in 1632 he was appointed legatus in the Rhine lands, with plenipotentiary authority over all the German generals and princes in the Swedish service. Although he never fought a battle, he was a born strategist, and frustrated all the efforts of the Spanish troops by his wise regulations. His military capacity was strikingly demonstrated by the skill with which he conducted large reinforcements to Gustavus through the heart of Germany in the summer of 1632. But it was only after the death of the king at Parnawa in 1632 that Oxenstjerna's time came. He inspired the despairing Protestants both in Germany and Sweden with fresh hopes. He reorganized the government both at home and abroad. He united the estates of the four upper circles into a fresh league against the common foe (1634), in spite of the envious and foolish opposition of Saxony. By the patent of the 12th of January 1633 he had already been appointed legate plenipotentiary of Sweden in Germany with absolute control over all the territory already won by the Swedish arms. No Swedish subject, either before or after, ever held such an unrestricted and far-reaching authority. Yet he was more than equal to the extraordinary difficulties of the situation. To him both warriors and statesmen appealed invariably as their natural and infallible arbiter. Richelieu himself declared that the Swedish chancellor was "an inexhaustible source of well-matured counsels." Less original but more sagacious than the king, he had a firmer grasp of the realities of the situation. Gustavus would not only have aggrandized Sweden, he would have transformed it into a German empire. Oxenstjerna was wise and English by birth, and he abandoned these vaunting ambitions. His country's welfare was his sole object. All his efforts were directed towards procuring for the Swedish crown adequate compensation for its sacrifices. Simple to humanity in his own tastes, he nevertheless recognized the political necessity of impressing his allies and confederates by an almost regal show of dignity; and at the abortive congress of Frankfort-on-Main (March 1634), held for the purpose of uniting all the German Protestants, Oxenstjerna appeared in a carriage drawn by six horses, with German princes attending him on foot. But from first to last his policy suffered from the slenderness of Sweden's material resources, a cardinal defect which all his craft and tact could not altogether conceal from the vigilance of her enemies. The success of his system
postulated an uninterrupted series of triumphs, whereas a single reverse was likely to be fatal to it. Thus the frightful disaster of Nördlingen (September 6th, 1643; see SWEDEN: History) brought him, for an instant, to the verge of ruin, and compelled him, for the first time, so far to depart from his policy of independence as to solicit direct assistance from France. But, well aware that Richelieu needed the Swedish armies as much as he himself needed money, he refused at the conference of Compiegne (1635) to bind his hands in the future for the sake of some slight present relief. In 1636, however, he concluded a fresh subsidy-treaty with France at Wismar. The same year he returned to Sweden and took his seat in the Regency. His presence at home overawed all opposition, and such was the general confidence inspired by his superior wisdom that for the next nine years his voice, especially as regarded foreign affairs, was omnipotent in the council of state. He drew up beforehand the plan of the Danish War of 1643-1645, so brilliantly executed by Lennart Torstensson, and had the satisfaction of severely crippling Denmark by the peace of Brömsebro (1645). His later years were embittered by the jealousy of the young Queen Christina, who thwarted the old statesman in every direction. He always attributed the exiguity of Sweden's gains by the peace of Osnabrück, of Christina's undue interference. Oxenstjerna was opposed at first to the abdication of Christina, because he feared mischief to Sweden from the unruled and adventurous disposition of her appointed successor, Charles Gustavus. The extraordinary consideration shown to him by the new king ultimately, however, reconciled him to the change. He died at Stockholm on the 28th of August 1654.

See Axel Oxenstjernas skriften och brefverk (Stockholm, 1888 et seq.); A. de Marny, Oxenstjerna och Richelieu à Compiegne (Paris, 1878).

2. COUNT JOHAN AXELSSON (1611-1657), son of the foregoing, completed his studies at Upsala in 1631, and was sent by his father on a grand tour through France, the Netherlands and Great Britain. He served under Count Gustavus Horn in the Thirty Years' War from 1632, and was subsequently employed by his father in various diplomatic missions, though his instructions were always so precise and minute that he was little more than the executor of the chancellor's wishes. He was one of the commissioners who signed the truce of 1635 with Poland, and in 1639, much against his father's will, was made a senator. Along with Salvius he represented Sweden at the great peace congress of Osnabrück, but as he received his instructions direct from his father, whereas Salvius was in the queen's confidence, the two "legates" were constantly at variance. From 1630 to 1652 he was governor-general of Pomerania. Charles X. made him earl marshal.

3. GABRIEL GUSTAFSSON (1587-1640), brother of (1), was from 1612 to 1618 the chief adviser of Duke John, son of King John III., and Gustavus Adolphus's competitor for the Swedish throne. After the duke's death he became, virtually, the locum-tenebr of the chancellor (with whom he was always on the most intimate terms) during Axel's frequent absences from Sweden. He was also employed successfully on numerous diplomatic missions. He was most usually the intermediary between his brother and the riksdag and senate. In 1634 he was created lord high steward. His special department, "Säve Hofret," the supreme court of justice, was ever a model of efficiency, and he frequently acted as chancellor and lord high treasurer as well.

See Gabriel Gustafssons bref till Riks Konsler Axel Oxenstjerna, 1611-1656 (Upsala, 1880).

4. COUNT BENGT OF BENEDICT GABRIELSSON (1623-1702), son of Axel Oxenstjerna's half-brother, Gabriel Bengtsson (1586-1656). After a careful education and a long residence abroad, he began his diplomatic career at the great peace congress of Osnabrück. During his stay in Germany he made the acquaintance of the count palatine, Charles Gustavus, afterwards Charles X., whose confidence he completely won. Two years after the king's accession (1645), Oxenstjerna was sent to represent Sweden at the Kreislag of Lower Saxony. In 1655 he accompanied Charles to Poland and was made governor of the conquered provinces of Kulp, Kujavia, Masovia and Great Poland. The firmness and humanity which he displayed in this new capacity won the affectionate gratitude of the inhabitants, and induced the German portion of them, notably the city of Thorn, to side with the Swedes against the Poles. During Charles's absence in Denmark (1657), Oxenstjerna, in the most desperate circumstances, tenaciously defended Thorn for ten months, and the terms of capitulation ultimately obtained by him were so advantageous that they were made the basis of the subsequent peace negotiations at Oliva, between Poland and Sweden, when Oxenstjerna was one of the chief plenipotentiaries of the Swedish regency. During the domination of Magnus de la Gardie he played but a subordinate part in affairs. From 1662 to 1666 he was governor-general of Livonia. In 1674 he was sent to Vienna to try and prevent the threatened outbreak of war between France and the empire. The connexions which he formed and the sympathies which he won here had a considerable influence on his future career, and resulted in his appointment as one of the Swedish envoys to the congress of Nijmegen (1676). His appointment was generally regarded as an approximation on the part of Sweden to Austria and France. During the congress he laboured assiduously in an anti-French direction; but well-justified anxiety of France was, indeed, henceforth the keynote of his policy, a policy diametrically opposed to Sweden's former system. In 1680 Charles XI. entrusted him absolutely with the conduct of foreign affairs, on the sole condition that peace was to be preserved, an office which he held for the next seventeen years to the very great advantage of Sweden. His leading political principles were friendship with the maritime powers (Great Britain and Holland) and the emperor, and a close anti-Danish alliance with the house of Holstein. Charles XI. appointed Oxenstjerna one of the regents during the minority of Charles XII. The martial proclivities of the new king filled the prudent old chancellor with alarm and anxiety. His protests were frequent and energetic; and he advised Charles in vain to accept the terms of peace offered by the first anti-Swedish coalition. Oxenstjerna has been described as "a shrewd and subtle little man, of gentle disposition, but remarkable for his firmness and tenacity of character."

See F. F. Carlson, Sveriges historia under Konungarnas af Palsafiska huset (Stockholm, 1883, 1885); O. Sjögren, Karl den elde och Svenska folket (Stockholm, 1897); and Negociations du comte d'Anuax pendant les annes 1693, 1697-1698 (Utrecht, 1882, &c.).

OXFORD, EARLS OF, an English title held successively by the families of Vere and Harley. The three most important ears of the Vere line (see Vere) are noticed separately below. The Veres held the earldom from 1142 until March 1709, when it became extinct on the death of Aubrey de Vere, the 20th earl. In 1711 the English statesman Robert Harley (see below) was created earl of Oxford; but the title became extinct in this family on the death of the 6th earl in 1853.

OXFORD, EDWARD DE VERE, 17TH EARL 1 OF (1550-1604), son of John de Vere, the 16th earl, was born on the 12th of April 1550. He matriculated at Queen's College, Cambridge, but he removed later to St John's College, and was known as Lord Bolebec or Bulbeck until he succeeded in 1562 to the earldom and to the hereditary dignity of great chamberlain of England. As one of the royal wards the boy came under the care of Lord Burghley, at whose house in London he lived under the tutelage of Sir John and Anne, Marquess of Ormond, the translator of Ovid. His violent temper and erratic doings were a constant source of anxiety to Burghley, who nevertheless in 1571 gave him his eldest daughter, Anne, in marriage. Oxford more than once asked for a military or a naval command, but Burghley hoped that his good looks together with his skill in dancing and in feats of arms would win for him a high position at court. His accomplishments did indeed secure Elizabeth's favour, but he offended her by going to Flanders without her consent in 1574, and more seriously in 1582 by a duel with one of her gentlemen, Thomas Knyvet. Among his other escapades was a futile

1 i.e. in the Vere line.
plot to rescue from the Tower Thomas Howard, 4th duke of
Norfolk, with whom he was distantly connected. In 1579 he
insulted Sir Philip Sidney by calling him a "puppy" on the
tennis-court at Whitehall. Sidney accordingly challenged
Oxford, but the queen forbade him to fight, and required him
to apologize on the ground of the difference of rank between
the disputants. On Sidney's refusal and consequent disgrace
Oxford is said to have schemed to murder him. The earl sat
on the special commission (1586) appointed for the trial of Mary
queen of Scots; in 1588 he was one of the peers who tried
Philip Howard, earl of Arundel, for high treason; and in 1601
he took part in the trial of Essex and Southampton. It
has been suggested that Oxford was the Italianated Englishman
ridiculed by Gabriel Harvey in his Speculum Tuscani ani. On
his return from a journey to Italy in 1575 he brought back various
inventions for the toilet, and his estate was rapidly dissipated
in satisfying his extravagant whims. His first wife died in 1588,
and from that time Burghley withdrew his support, Oxford
being reduced to the necessity of seeking help among the poor
men of letters whom he had at one time or another befriended.
He was himself a lyric poet of no small merit. His fortunes
were partially retrieved on his second marriage with Elizabeth
Trentham, by whom he had a son, Henry de Vere, 18th earl of
Oxford, and Maud (d. 1413), daughter of Sir Ralph de Ufford
d. 1436), and a descendant of King Henry III. He became
9th earl of Oxford on his father's death in 1371, and married
Philippa (d. 1412), daughter of his guardian Engelram de Couci,
earl of Bedford, a son-in-law of Edward III., quickly becoming
very intimate with Richard II. Already hereditary great
chamberlain of England, Oxford was made a member of the
privy council and a Knight of the Garter; while castles and
lands were bestowed upon him, and he was constantly in
the company of the young king. In 1385 Richard decided to send
his friend to govern Ireland, and Oxford was given extensive
rights in that country and was created marquis of Dublin for
life; but although preparations were made for his journey he
did not leave England. Meanwhile the discontent felt at
Richard's incompetence and extravagance was increasing, one
of the contributory causes thereto being the king's partiality
for Oxford, who was regarded with jealousy by the nobles and
who made powerful enemies about this time by divorcing his
wife, Philippa, and by marrying a Bohemian lady. The king,
however, indifferent to the gathering storm, created Vere duke
of Ireland in October 1386, and gave him still more extensive
powers in that country, and at once matters reached a climax.
In 1388 he was deprived of a short time, and
Vere was ordered in vain to proceed to Ireland. The latter
was then among those who were accused by the king's uncle Thomas
of Woodstock, duke of Gloucester, and his supporters in November
1387; and rushing into the north of England he gathered an
army to defend his royal master and himself. At Radcot Bridge
in Oxfordshire, however, his men fled before the troops of
Gloucester, and Oxford himself escaped in disguise to the Nether-
lands. In the parliament of 1388 he was found guilty of treason
and was condemned to death, but as he remained abroad the
sentence was never carried out. With another exile, Michael
de la Pole, duke of Suffolk, he appears to have lived in Paris
until after the treaty between England and France in June 1389,
when he took refuge at Louvain. He was killed by a boar whilst
hunting, and left no children. In 1395 his body was brought
from Louvain to England, and was buried in the priory at
Earl's Colne, Essex.

OXFORD, JOHN DE VERE, 13th Earl of (1443-1513), was
second son of John, the 12th earl, a prominent Lancastrian,
who, together with his eldest son Aubrey de Vere, was executed
in February 1462. John de Vere the younger was himself
attained, but two years later was restored as 13th earl. But
his loyalty was suspected, and for a short time at the end of
1468 he was in the Tower. He sided with Warwick, the king-maker,
in the political movements of 1469, accompanied him in his
exile next year, and assisted in the Lancastrian restoration of
1470-1471. As constable he tried John Tipoft, earl of Worcester,
who had condemned his father nine years before. At
the battle of Barnet, Oxford was victorious in command of the
Lancastrian right, but his men got out of hand, and before
they could be rallied Warwick was defeated. Oxford escaped
to France. In 1473 he organized a Lancastrian expedition,
which, after an attempted landing in Essex, sailed west
and seized St Michael's Mount in Cornwall. It was only after a
four months' siege that Oxford was forced to surrender in
February 1474. He was sent to Hames near Calais, whence,
ten years later, in August 1484, he escaped and joined Henry
Tudor in Brittany. He fought for Henry in high command at
Bosworth, and was rewarded by restoration to his titles, estates
and hereditary office of Lord Chamberlain. At Stoke on the
16th of June 1486 he led the van of the royal army. In 1492
he was in command in the expedition to Flanders, and in 1497
was foremost in the defeat of the Cornish rebels on Blackheath.
Bacon (Hist. of Henry VII. p. 192, ed. Lumby) has preserved
a story that when in the summer of 1498 Oxford entertained
the king at Castle Hedingham, he assembled a great number of his
retainers in his castle. Henry thanked the earl for his reception,
but fined him 15,000 marks for the breach of the laws. Oxford
was high steward at the trial of the earl of Warwick, and one of
the commissioners for the trial of Sir James Tyrrell and others
in May 1502. Partly through ill-health he took little part
afterwards in public affairs, and died on the 10th of March 1513. He
was twice married, but left no children.

Oxford is frequently mentioned in the Paston Letters, which
include twenty written by him, mostly to Sir John Paston
the younger. See The Paston Letters, ed. J. Gardiner; Chronicles
of London, ed. C. L. Kingsford (1903); Sir James Ramsay, Lancaster
and York; and The Political History of England, vols. iv. and v.
(C. L. K.)

OXFORD, ROBERT HARLEY, 1st Earl of (1661-1724),
English statesman, commonly known by his surname of HARLEY,
eldest son of Sir Edward Harley (1624-1700), a prominent land-
owner in Herefordshire, and grandson of the celebrated letter-
writer Lady Brilliana Harley (c. 1600-1643), was born in Bow
Street, Covent Garden, London, on the 5th of December 1661.
His school days were passed at Shilton, near Burford, in Oxford-
shire, in a small school which produced at the same time a lord
high treasurer (Harley), a lord high chancellor (Simon Harcourt)
and a lord chief justice of the common pleas (Thomas Trevor).
The principles of Whiggism and Nonconformity were instilled
into his mind at an early age, and if he changed the politics of
his ancestors he never formally abandoned their religious opinions.
At the Revolution of 1688 Sir Edward and his son raised a troop
of horse in support of the cause of William III., and took posses-
sion of the city of Worcester in this interest. This recommended
Robert Harley to the notice of the Boscawen family, and led
him to his election in April 1690 as a parliamentary representative
of Tregony, a borough under their control. He remained for
one parliament, when he was elected by the constituency of New
Radnor, and he continued to represent it until his elevation to the
peerage in 1711.

From the first Harley gave great attention to the conduct of
public business, bestowing especial care upon the study of the
forms and ceremonies of the House. His reputation marked
him out as a fitting person to preside over the debates of the
House, and from the general election of February 1701 until
the dissolution of 1705 he held with general approbation the office
of

1 i.e. in the Harley line.
of speaker. For a part of this period, from the 13th of May
1704, he combined with the speakership the duties of a principal
secretary of state for the northern department, displacing in that
office the Tory earl of Nottingham. In 1703 Harley first made
use of Defoe's talents as a political writer, and this alliance with
the press proved so successful that he afterwards called the genius
of Swift to his aid in many pamphlets against his opponents in
politics. While he was secretary of state the union with Scotland
was effected. At the time of his appointment as secretary of
state Harley had given no outward sign of dissatisfaction with
the Whigs, and it was mainly through Marlborough's good
opinion of his abilities that he was admitted to the ministry.
For some time, so long indeed as the victories of the great English
generals cast a glamour over the policy of his friends, Harley
continued to act loyally with his colleagues. But in the summer of
1707 it became evident to Godolphin that some secret influence
behind the throne was shaking the confidence of the queen in her
ministers. The sovereign had resented the intrusion into the
administration of the impetuous earl of Sunderland, and had
persuaded herself that the safety of the church depended on the
fortunes of the Tories. These convictions were strengthened in her
mind by the new favourite Abigail Hill (a cousin of the
duchess of Marlborough through her mother, and of Harley on
her father's side), whose soft and silky ways contrasted only too
favourably in the eyes of the queen with the haughty manners of
her old friend, the duchess of Marlborough. Both the duchess
and Godolphin were convinced that this change in the disposition
of the queen was due to the sinister conduct of Harley and his
relatives; but he was for the present permitted to remain in his
office. Subsequent experience showed the necessity for his dis-
missal and an occurrence supplied an opportunity for carrying
out their wishes. An ill-paid and poverty-stricken clerk, William
Gregg, in Harley's office, was detected in furnishing the enemy
with copies of many documents which should have been kept
from the knowledge of all but the most trusted advisers of the
crown. It was found that through the carelessness of the head
of the department the contents of such papers became the
common property of all in his service. The queen was therefore
informed that Godolphin and Marlborough could no longer serve
in concert with him. They did not attend her next council,
on the 8th of February 1708, and when Harley proposed to
procceed with the business of the day the duke of Somerset drew
attention to their absence, when the queen found herself forced
(February 11,) to accept the resignations of both Harley and St
John.

Harley went out of office, but his cousin, who had now become
Mrs Masham, remained by the side of the queen, and contrived
to convey to her mistress the views of the ejected minister.
Every device which the defeated ambition of a man whose
strength lay in his aptitude for intrigue could suggest for hasten-
ing the downfall of his adversaries was employed without scruple,
and not employed in vain. The cost of the proscribed traitor
was with France, and the danger to the national church, the chief proof
of which lay in the prosecution of Sacheverell, were the weapons
which he used to influence the masses of the people. Marlborough
himself could not be dispensed with, but his relations were
dismissed from their posts in turn. When the greatest of these,
Lord Godolphin, was ejected from office, five commissioners to
the treasury were appointed (August 10, 1710), and among them
figured Harley as chancellor of the exchequer. It was the
aim of the new chancellor to frame an administration from the
moderate members of both parties, and to adopt with but slight
changes the policy of his predecessors; but his efforts were
doomed to disappointment. The Whigs refused to join in an
alliance with the man whose rule began with the retirement from
the treasury of the finance minister idolized by the city merchants,
and the Tories, who were successful beyond their wildest hopes at
the political ball, were not unwilling to adopt a policy more favourable
to the interests of their party. The clamours of the wilder spirits, the country members who met
at the "October Club," began to be re-echoed even by those
who were attached to the person of Harley, when, through an
unexpected event, his popularity was restored at a bound.
A French refugee, the ex-abbé de la Bourlie (better known by the
name of de Guiscard), was, before coming before the privy council on a charge of treachery to the nation which had
befriended him, when he stabbed Harley in the breast with a
penknife (March 8, 1711). To a man in good health the
wounds would not have been serious, but the minister had been
for some time indisposed—a few days before the occurrence Swift
had penned the prayer "Pray God preserve his health, every-
thing depends upon it"—and the joy of the nation on his re-
coverv knew no bounds. Both Houses presented an address
to the crown, suitable response came from the queen, and on
Harley's reappearance in the Lower House the speaker made an
oration which was spread broadcast through the country. On
the 23rd of May 1711 the minister became Baron Harley of
Wigmore and earl of Oxford and Mortimer; on the 26th of
May he was created lord treasurer, and on the 25th of October
1712 became a Knight of the Garter. Well might his friends
exclaim that he had "grown by persecutions, turnings out, and
stabbings."

With the sympathy which this attempted assassination had
evoked, and with the skill which the lord treasurer possessed
for conciliating the calmer members of either political party,
he passed through several months of office without any loss of
reputation. He rearranged the nation's finances, and continued
to support her generals in the field with ample resources for
carrying on the campaign, though his emissaries were in com-
communication with the French king, and were settling the terms of
a peace independently of England's allies. After many weeks of
vacillation and intrigue, when the negotiations were frequently
on the point of being interrupted, the preliminary peace was
signed, and in spite of the opposition of the Whig majority in
the Upper House, which was met by the creation of twelve new
peers, the much-vexed treaty of Utrecht was brought to a con-
clusion on the 31st of March 1713. While these negotiations
were under discussion the minister's brother-in-law St John,
who had become secretary of state in September 1710,
was fast changing into hatred. The latter had resented the rise
in fortune which the stabs of Guiscard had secured for his
colleague, and when he was raised to the peerage with the
title of Baron St John and Viscount Bolingbroke, instead of
with an earldom, his resentment knew no bounds. The royal
favourite, whose husband had been called to the Upper House
as Baron Masham, deserted her old friend and relation for his
more vivacious rival. The Jacobites found that, although the
lord treasurer was profuse in his expressions of good will for their
cause, no steps were taken to ensure its triumph, and they no
longer placed reliance in promises which were repeatedly made
and repeatedly broken. Even Oxford's friends began to com-
plain of his habitual dilatoriness, and to find some excuse for
his apathy in ill-health, aggravated by excess in the pleasures
of the table and by the loss of his favourite child. By slow
degrees the confidence of Queen Anne was transferred from
Oxford to Bolingbroke; on the 27th of July 1714 the former
surrendered his post as lord treasurer, and on the 1st August
the queen died.

On the accession of George I. the defeated minister retired
to Herefordshire, but a few months later his impeachment was
decided upon and he was committed to the Tower on the 16th
of July 1715. After an imprisonment of nearly two years the
prison doors were opened in July 1717 and he was allowed
(which hisמנהegers, the part he took in public
affairs, and died almost unnoticed in London on the 21st of May
1724. He married, in May 1685, Edith, daughter of Thomas
Foley, of Witley Court, Worcester. She died in November
1691. His second wife was Sarah, daughter of Simon Middleton,
of Edmonton. His son Edward (1689-1741), who
was married to Henrietta (d. 1735), daughter and heir
device of John Holles, duke of Newcastle, and his only son, a
dughter Margaret (1715-1783), married William Bentinck, 2nd duke
of Portland, to whom she brought Welbeck Abbey and the London
property which she inherited from her mother. The earldom
then passed to a cousin, Edward, 3rd earl (c. 1690-1725), and eventually became extinct with Alfred, the 6th earl (1809-1893). His character is set forth in the brightest colours in the poems of Pope and the prose of Swift. The Irish dean was his discriminating friend in the hour of prosperity, his unswerving advocate in adversity. The books and manuscripts which the 1st earl of Oxford and his son collected were among the glories of their age. The manuscripts became the property of the nation in 1753 and are now in the British Museum; the books were sold to a bookseller called Thomas Osborne in 1742 and described in a printed catalogue of five volumes (1743-1745). Dr Johnson writing an account of the library. A selection of the rarer pammelts and tracts, which was made by William Oldys, was printed in eight volumes (1744-1746), with a preface by Johnson. The best edition is that of Thomas Park, ten volumes (1805-1813). In the recollection of the Harleian manuscripts, the Harleian library and the Harleian Miscellany, the family name will never die. 

Bibliography.—The best life of Harley is by E. S. Roscoe (1902). Articles relating to him are in Eng. Hist. Rev. xxv. 238-250 (Defoe and Harley by Thomas Bateson); Trans. of the Royal Hist. Soc. xiv. N.S. 69-121 (development of political parties temp. Q. Anne. by W. W. Tender); xvi. 457-488 (Harley papers). For his relations with St John see Walter Sichel's Bologbrooke (1901-1902, 2 vols.); for those with Swift, consult the Journal to Stella and Sir Henry Carell's Life of Swift (2nd ed., 1894, 2 vols.).

OXFORD, a city, municipal and parliamentary borough, the county town of Oxfordshire, England, and the seat of a famous university.1 Pop. (1901) 49,336. It is situated on the river Thames, s. by road and 63½ m. by rail W.N.W. of London. It is served by the main northern line of the Great Western railway, and by a branch from the London & North-Western system at Bletchley, while the Thames, and the Oxford canal, running north from it, afford water communications. The ancient nucleus of the city stands on a low gravel ridge between the Thames and its tributary the Cherwell, here which flow with meandering courses and many branches and backwaters through flat meadows. Modern extensions of Oxford cross both rivers, the suburbs of Osney and Botley lying to the west, Grandpont to the south, and St Clement's to the east beyond the Cherwell. To the north is a large modern residential district. The low meadow land is bounded east and west by well-wooded hills, rising rather abruptly, though only to a slight elevation, seldom exceeding 50 ft. Several points on these hills command celebrated views, such as that from Bagley Hill to the S.W., or from Elsafield to the N.E., from which only the inner Oxford is visible, with its collegiate buildings, towers and spires—a cityless city.

Main roads from east to west and from north to south intersect the centre of ancient Oxford at a point called Carfax,2 and form four principal streets, High Street (east), Queen Street (west), Cornmarket Street (north) and St Aldate's (south).3 Cornmarket Street is continued northward by Magdalen Street, and near their point of junction Magdalen Street is intersected by a thoroughfare formed, from west to east, by George Street, Broad Street, Holywell Street and Long Wall Street, the last of which sweeps south to join High Street not far from Magdalen Bridge over the Cherwell. This thoroughfare is thus detailed, because it approximately indicates the northern and eastern confines of the ancient city. The old walls indeed (of which there are many fragments, notably a very fine range in New College garden) indicate a somewhat smaller area than that defined by these streets. Their line, which slightly varied, as excavations have shown, in different ages, bent south-westward from Cornmarket Street, where stood the north gate, till it reached the enceinte of the castle, which lies at the west of the old city,4 and also Universities.

The common speech of the university some streets are never spoken of as such, but, e.g., as "the High," "the Corn" (i.e. Cornmarket), "the Broad." St Aldate's is pronounced St Olds, and the Cherwell (pronounced Charrwell) is called "the Char." flanked on one side by a branch of the Thames. From the castle the southern wall ran east, along the modern Brewers' Street; the south gate of the city was in St Aldate's Street, where it is joined by this lane, and the walls then continued along the north side of Christ Church meadow, and north-eastward to the east gate, which stood in High Street near the junction of Long Wall Street. Oxford had thus a spacious position: the castle and the Thames protected it on the east; the two rivers, the walls and the water-meadows between them on the south and east; and on the north the wall and a deep ditch, of which vestiges may be traced, as between Broad and Ship Streets.

An early rivalry between the universities of Oxford and Cambridge led to the circulation of many groundless legends respecting their foundation. For example, those which connected Oxford with "Brute the Trojan," King Memnepic (1000 B.C.), and the Druids, are not found before the 14th century. The town is as a fact much older than the university. The historian, John Richard Green, epitomizes the relation between the two corporations when he shows4 that "Oxford had already seen five centuries of borough life before a student appeared within its streets." The university found Oxford a busy, prosperous borough, and reduced it to a cluster of lodging-houses. It found it among the first of English municipalities, and it so utterly crushed its freedom that the recovery of some of the commercial rights of self-government has only been brought about by recent legislation." A poor Romano-British village may have existed on the peninsula between Thames and Cherwell, but no Roman road of importance passed within 3 m. of it. In the 8th century an indication of the existence of Oxford is found in the legend of St Frideswide, a holy woman who is said to have died in 735, and to have founded a nunnery on the site of the present cathedral. Coins of King Alfred have been discovered (though not at Oxford) bearing the name Osnafora or Orsnafora, which seems to prove the existence of a mint at Oxford. It is clear, at any rate, that Oxford was already important as a frontier town between Mercia and Wessex when the first unquestionable mention of it occurs, namely in the English Chronicle under the year 912, when Edward the Elder paid toll to himself at London and Oxford. The name points to a ford for oxen across the Thames, though some have connected the syllable "ox" with a Celtic word meaning "water," comparing it with Ouse, Osney, and Evesford. The first mention of the townsman of Oxford is in the English Chronicle of 1013, and that of its trade in the Abingdon Chronicle, which mentions the toll paid from the 11th century to the abbot of Abingdon by boats passing that town. Notices during that century prove the growing importance of Oxford. As the chief stronghold in the upper Thames valley it sustained various attacks by the Danes, being burned in 979, 1002 and 1010, while in 1013 Sweyn took hostages from it. It had also a considerable political importance, and several monasteries were held here, as in 1015, when the two Danish thanes Sigfrith and Morkere were treacherously killed by the Mercian Edric; in 1020, when Canute chose Oxford as the scene of the confirmation of "Edgar's law" by Danes and English; in 1036, when Harold I was chosen king, and in 1065. But Oxford must have suffered heavily about the time of the Conquest, for according to the Domesday Survey (which for Oxford is unusually complete) a great proportion of the "manors" (160 out of 297) and houses (478 out of 721) were ruined or unoccupied. The city, however, had already a market, and under the strong hand of the Norman sheriff Robert d'Olli (c. 1070-1119) it prospered steadily. He made heavy excutions on the townsmen, though it may be noted that they withheld from him Port Meadow, the great meadow of 440 acres which is still a feature of the low riverside tract north of Oxford. But d'Olli did much for Oxford, and the strong tower of the castle and possibly that of St Michael's church are extant relics of his building activity. His nephew, another Robert, who held the castle after him, founded in 1129 the most notable building that

Oxford has lost. This was the priory (shortly afterwards the abbey) of Osney, which was erected by the branch of the Thames next west of that by which the castle stands. In its finished state it had a splendid church, with two high towers and a great range of buildings, but only slight fragments may now be traced.

About 1130 Henry I. built for himself Beaumont Palace, the site of which is indicated by Beaumont Street, and the same king gave Oxford its first known charter (not still extant), in which mention is made of a gold merchant. This charter is alluded to in another of Henry II., in which the citizens of Oxford and London are associated in the possession of similar customs and liberties. The most notable historical incident connected with the city in this period is the escape of the empress Matilda from the castle over the frozen river and through the snow to Abingdon, when besieged by Stephen in 1142.

It is about this time that an indication is first given of organized teaching in Oxford, for in 1133 one Robert Pulin is said to have instituted theological lectures here. No earlier facts are known concerning the origin of the university, though it may with probability be associated with schools connected with the ecclesiastical foundations of Eton and St. Frideswide, and the tendencies of Oxford to become a centre of learning may have been fostered by the frequent presence of the court at Beaumont.

A chancellor, appointed by the bishop of Lincoln, is mentioned in 1214, and an early instance of the subordination of the town to the university is seen in the fact that the townsfolk were required to take oaths of peace before this official and the archdeacon. It may be mentioned here that the present practice of appointing a non-resident chancellor, with a resident vice-chancellor, did not come into vogue till the end of the 15th century. In the 13th century a number of religious orders, which here as elsewhere exercised a profound influence on education, became established in Oxford. In 1221 came the Dominicans, whose later settlement (c. 1260) is attested by Blackfriars Street, Preacher's Bridge and Friars' Wharf. In 1224 the Franciscans settled near the present Paradise Square. In the middle of the century the Carmelites occupied part of the present site of Worcester College, but their place here was taken by the Benedictines when, about 1315, they were given Broad Street by Edward II., and removed there. The Austin Friars settled near the site of Wadham College; for the Cistercians Rawley Abbey, scanty remains of which may be traced near the present railway stations, was founded c. 1280. During the same century the political importance of Oxford was maintained. Several parliaments were held here, notably the Mad Parliament of 1258, which enforced the enactment of the Provisions of Oxford. Again, the later decades of the 13th century saw the initiation of the collegiate system. Merton, University and Balliol were the earliest foundations under this system. The paragraphs below, dealing with each college successively, give the dates and circumstances of foundation for all. As to the relations between the university and the city, in 1248 a charter of Henry III. afforded students considerable privileges at the expense of townsfolk, in the way of personal and financial protection. Moreover, the chancellor already possessed judicial powers; even over the townsfolk he stood in jurisdiction with the mayor. No uncertainty therefore existed concerning the preponderant rivalry between “town and gown”; rivalry led to violence, and after many lesser encounters a climax was reached in the riot on St. Scholastica's and the following day, February 10th and 11th, 1354/5. Its immediate cause was trivial, but the townsmen gave rein to their long-standing animosity, severely handled the scholars, killing many, and paying the penalty, for Edward III. gave the university a new charter enhancing its privileges. Others followed from Richard II. and Henry IV. A charter given by Henry VIII. in 1533 at the instigation of Wolsey conferred such power on the university that traders of any sort might be given its privileges, so that the city had no jurisdiction over them. In 1571 was passed the act of Elizabeth which incorporated and reorganized the universities of Oxford and Cambridge. In 1635 a charter of Charles I. confirmed its privileges to the university of Oxford, of which William Laud had become chancellor in 1630. Vestiges of these exaggerated powers (as distinct from the more equitable division of rights between the two corporations which now obtains) long survived. For example, it was only in 1825 that the ceremony of reparation enforced on the municipality after the St Scholastica riots was discontinued.

During the reign of Mary, in 1555, there took place, on a spot in Broad Street, the famous martyrdom of Ridley and Latimer. Cranmer followed them to the stake in 1556, and the three are commemorated by the ornate modern cross, an early work of Sir G. G. Scott (1841), in St Giles Street beside the church of St Mary Magdalen. A period such as this must have been in many ways harmful to the university, but it recovered prosperity under the care of Elizabeth and Wolsey. During the civil war, however, Oxford, as a city, suddenly acquired a new prominence as the headquarters of the Royalist party and the meeting-place of Charles I.'s parliament. This importance is not incomparable with that which Oxford possessed in the Mercian period. However, the frontier shifted, between the districts held by the king and by the parliament, Oxford was always close to it. It was held by the king, the Oxford University. The final investment of the city, when Charles had lost every other stronghold of importance, and had himself escaped in disguise, was in May 1646, and on the 24th of June it surrendered to Fairfax. Throughout the war the secret sympathies of the citizens were Parliamentarian, but there was no conflict within the walls. The disturbances of the war and the divisions of parties, however, had bad effects on the university, being subversive of discipline and inimical to study; nor were these effects wholly removed during the Commonwealth, in spite of the care of Cromwell, who was himself chancellor in 1651-1657. The Restoration led to conflicts between students and citizens. Charles II. held the last Oxford parliament in 1658. James II.'s action in forcing his schemes into certain high offices at last brought the university into temporary opposition to the crown. Later, however, Oxford became strongly Jacobite. In the first year of George I.'s reign there were serious Jacobite riots, but from that time the city becomes Hanoverian in opposition to the university, the feeling coming to a head in 1755 during a county election, which was ultimately the subject of a parliamentary inquiry. But George III., visiting Oxford in 1785, was well received by both parties, and this visit may be taken as the termination of the purely political history of Oxford. Details of the history of the university may be gathered from the following description of the colleges, the names of which are arranged alphabetically.

All Souls College was founded in 1437 by Henry Chicheley (q.v.), archbishop of Canterbury, for a warden, 40 fellows, 2 chaplains, and clerks. The charter was issued in the name of Henry VI., and it has been held that Chicheley wished, by founding the college, to exculpate his own support of the disastrous wars in France during the reign of Henry V. and the ensuing regency. Fifty fellowships in all were provided for by the modern statutes, besides the honorary fellowships to which men of eminence are sometimes elected. Some of the fellowships are held in connexion with university offices; but the majority are awarded on examination, and are among the highest honours in the university offered by this method. The only under-graduate members of the college are four bible-clerks,1 so that the college occupies a peculiar position as a society of graduates. The college has its beautiful original front upon High Street; the first quadrangle, practically unaltered since the foundation, is one of the most characteristic in Oxford. The chapel has a splendid reredos occupying the whole eastern wall, with tiers of figures in niches. After the original figures had been destroyed during the Reformation the reredos was plastered over, but

1 Here and in some other colleges this title is connected with the duties of reading the Bible in chapel and saying grace in hall.
when the plaster was removed, Sir Gilbert Scott found enough remains to render it possible to restore the whole. The second
quadrangle is divided from Radcliffe Square by a stone screen
and cloister. From the eastern range of buildings twin towers rise in graduated stages. On the north side is the library. The
whole is in a style partly Gothic, partly classical, fantastic, but
not without dignity. The architect was Sir Christopher Wren's
pupil, Nicholas Hawksmoor; the building was spread over the
first half of the 18th century. The fine library originated in a
bequest of Sir Christopher Codrington (d. 1710), and bears his
name. One of the traditional customs surviving in Oxford is
found at All Souls. Legend states that a mallard was discovered
in a drain while the foundations were being dug. A song
(probably Elizabethan) on this story is still sung at college
gaudies, and later it is pretended to hunt the bird. With such
a foundation as All Souls, a great number of eminent names are
naturally associated (see Montagu Burrows, Worthies of All
Souls, 1874).

Balliol College is one of the earliest foundations. About
1263 John de Balliol (see BALLIOL, family) began, as part of a
penance, to maintain certain scholars in Oxford. Dervorguilla,
his wife, developed his work after his death in 1269 by building
the college. But the college was brought into final form (apart from modern revision) until 1504. There are now twelve fellowships and fifteen scholarships on the
old foundation. Two fellowships, to be held by members already
holding fellowships of the college, were founded by James Hosier,
second Lord Newlands, in 1606, in commemoration of Benjamin
Jowett, master of the college. The buildings, which front upon
Broad Street, Magdalen Street and St Giles Street, are for the
most part modern, and mainly by Alfred Waterhouse, Anthony
Salvin and William Butterfield. The college has a high reputation
for scholarship. Its master and fellows possess the unique
right of electing the visitor of the college. In 1885 Balliol
College absorbed New Inn Hall, one of the few old halls which
had survived till modern times. In the time of the civil wars
a royal mint was established in it.

Brasenose College (commonly written and called B.N.C.)
was founded by William Smith, bishop of Lincoln, and Sir
Richard Sutton of Prestbury, Cheshire, in 1509. Its name,
however, perpetuates the fact that it took the place of a much
earlier institution in Oxford. There were several small halls on its site, all dependent on other colleges or religious
houses except one—Brasenose Hall. The origin of this hall is not
known, but it existed in the middle of the 12th century.
In 1354 certain students, wishing for peace from the faction-fights
which were then characteristic of their life in Oxford, migrated
to Stamford, where a doorway remains of the hall then occupied
by them as Brasenose Hall. From this an ancient knocker in the
form of a nose may have belonged to the hall at Oxford, was brought to the college in 1890. It presumably
gave its name to the hall, though a derivation from *brasium*
(Latin for a brew-house) was formerly upheld. The original
foundation of the college was for a principal and twelve fellows.
This number is maintained, but supernumerary fellowships are added.
Of a number of scholarships founded by various benefactors several are confined to certain schools, notably Manchester
Grammar School. William Hulme (1601) established a foundation
which provides for twelve scholars and a varying number of
exhibitioners on entrance, and also for eight senior scholarships
under certain conditions to members of the college in residence. The main front of the college faces Radcliffe
Square; the whole of this and the first quadrangle, excepting
the upper storey, is of the time of the foundation; and the
gateway tower is a specially fine example. The hall and
the chapel, with its fine fan-tracery roof, date from 1663 and 1666,
and are attributed to Sir Christopher Wren. In both is seen
a curious attempt to combine Gothic and Grecian styles. Modern
buildings (by T. G. Jackson) have a frontage upon High Street.
Robert Burton, author of *The Anatomy of Melancholy*, became
an undergraduate of the college in 1593; Reginald Heber in
1800; Walter Pater became a fellow in 1854.

Christ Church, in point of number of its members the
largest collegiate foundation in Oxford, is also eminent owing to
its unique constitution, the history of which involves that of the
see of Oxford. Magnation has been made of the priory
of St Frideswide and its very early foundation, also of the later
but more magnificent foundation of Osney Abbey. Both of
these were involved in the sweeping changes initiated by Wolsey
and carried on by Henry VIII. Wolsey projected the foundation
of a college on an even grander scale than that of the present
house. In 1524-1525 he obtained authority from Pope Clement
VII. to suppress certain religious houses for the purpose of
this new foundation. These included St Frideswide’s, which
occupied part of the site which Wolsey intended to use. The
new college, under the name of Cardinal College, was licensed
by the king in 1525. Its erection began immediately. The
monastic buildings were in great part removed. Statutes were
issued and appointments were made to the new offices. But
in 1529 Wolsey fell from power. Cardinal College was
suppressed, and in 1532 Henry VIII. established in its place another
college, on a reduced foundation, called King Henry VIII’s
College. Oxford had been, and was at this time, in the huge
district of Lincoln diocese. In 1542, on the suppression of Osney
Abbey, a new see was created, and the abbey church was made
its cathedral. This arrangement obtained only until 1545,
when both the new cathedral church and the new college which
took the place of Wolsey’s foundation were surrendered to the
king. In 1546 Henry established the composite foundation
which now (subject to certain modern alterations) exists. He
provided for a dean and eight canons and 100 students, to
which number one was added in 1664. The church of St Frides-
wide’s foundation became both the cathedral of the diocese
and the college chapel. The establishment was thus at once
diocesan and collegiate,1 and it remains so, though now the
foundation consists of a dean, six canons, and the usual cathedral
staff, a reduced number of students (corresponding to the fellows
of other colleges) and scholars. Five of the canons are university
professors. The disciplinary administration of the collegiate
part of the foundation is under the immediate supervision of
two students who hold the office of censors. Queen Elizabeth
established the connexion with Westminster School by which
now more than three-fifths of the students are elected there each year to Christ Church. There is also a large number of visiting scholars.
The great number of eminent men associated with Christ
Church can only be indicated here by the statement that its
books have borne the names of several members of the British
and other royal families, including that of King Edward VII.
as prince of Wales and of Frederick VIII. of Denmark as crown
prince; also of ten prime ministers during the 19th century.
The stately front of Christ Church is upon St Aldate’s Street.
The great gateway is surmounted by a tower begun by Wolsey,
but only completed in 1682 from designs of Sir Christopher Wren.
Though somewhat incongruous in detail, it is of singular
and beautiful form, being octagonal and surmounted by a cupola.
It contains the great bell “Tom” (dedicated to St Thomas of
Canterbury), which, though recast in 1680, formerly belonged
to Osney Abbey. A clock strikes the hours on it, and at five
minutes past nine o’clock in the evening it is rung 101 times
by hand, to indicate the hour of closing college gates, the number
being that of the founder body of students. The gate, the tower,
and the first quadrangle are all commonly named after this bell.
Tom Quadrangle is the largest in Oxford, and after being
for various restorations approximated to Wolsey’s original design,
though the cloisters which he intended were never built. On
the south side lies the hall, entered by a staircase under a magni-
cent fan-tracery roof dating from 1640. The hall itself is one
of the finest refectories in England; its roof is of ornate timber-
work (1530) and a splendid series of portraits of eminent *alumni*
of the house adorn the walls, together with Holbein’s portraits

1 As a whole it is therefore properly to be spoken of as Christ
Church, not Christ Church College. In the common speech of
the university it has become known as The House, though all the
colleges are technically "houses."
of Henry VIII, and Wolsey. With the hall is connected the great kitchen, the first building undertaken by Wolsey. An entrance through the eastern range of Tom Quadrangle forms the west portal of the Cathedral Church of Christ.

The cathedral, of which the nave and choir serve also as the central hall, is the smallest English cathedral, but is of high architectural interest. The plan is cruciform, with a northward extension from the north choir aisle, comprising the Lady chapel and the Latin chapel. It has been seen that probably in the 8th century the church was founded a religious house. To the east end of the north choir aisle and Lady chapel may be seen two blocked arches, rude, narrow and low. Excavations outside the wall in 1887 revealed the foundations of three apses corresponding with these two modern arches, which having been built across them, there is clearly a remnant of the small Saxon church, with its eastward triple-apsed termination. In 1902 there took place the massacre of the Danes on St Brice's day's at the order of Ethelred II. Some Danes took refuge in the tower of St Brice's church, but the Danes were killed by them. In 1004 the king undertook the rebuilding of the church. There is full reason to believe that he had assistance from his brother-in-law, Richard II, duke of Normandy, and that much of his work remains. The nave and arcades were left unfinished. About 1170, however, there was an extensive Norman restoration. The arcades of the choir and the nave, which was shortened by Wolsey for the purpose of his collegiate building, have massive piers, which, though not as large as those of在外侧的主梁。the Norman stone-vaulted aisles conform in height with these lower arched modern cloisters. The clerestory is remarkable. The striking Norman restoration by Sir Gilbert Scott, consisting of two windows and a rose window above them, with an intervening arcade. The choir has a Perpendicular fan-tracery roof in stone, one of the finest modern examples of Early English architecture, and the nave, with this style. The nave roof is woodwork of the 16th century, and there is a fine Jacobean pulpit. The lower part of the tower, with internal arches in the lantern, is Norman; the upper stage is of brick. The low spire, possibly the earliest built in England. St Lucy's chapel in the south transept aisle contains a rich flamboyant Decorated window. In the north choir aisle are the fragments which have been discovered and roughly reconstructed of St Frideswide's shrine, of marble, with foliage beautifully carved, and representing plants symbolical of the life of the Saint. The Latin chapel is of various dates, but mainly of the 14th century. The north windows contain contemporary glass; the east window is a rich early work of Sir E. Burne-Jones, set in stonework of an inharmonious Venetian design. There are other beautiful windows by Burne-Jones at the east ends of the aisles and Lady chapel, and at the west end of the south nave aisle. The corresponding window of the north aisle is a curious work by the Dutch artist Abraham van Cuylenborch (1600). The peculiar arrangement of the clerestory windows of the cathedral, the nave and choir being occupied by modern carved pews or stalls running east and west, and the position of the organ on a screen at the west end, add to the distinctive interior appearance of the building. Small ornamental and others, and an ornate Norman doorway gives access from them to the chapter-house, a beautiful Early English room. Above the cloisters on the south rises the "old library," originally the monastic refectory, which has suffered conversion into dwelling and lecture-rooms.

To the north-east of Tom Quadrangle is Peckwater Quadrangle, named from an ancient hall on the site, and built from the design of the versatile Dean Henry Aldrich (1709) with the exception of the library (1716-1761), which forms one side of it. The whole is classical in style. The library contains some fine portraits by Van Dyck and others, and sculpture by Rysbrack, Reubel, and others. In 1736 the small Canterburry Quadrangle, to the east, was built in 1773-1783, and marks the site of Canterbury College or Hall, founded by Archbishop Islip in 1363, and absorbed in Henry VIII's foundation. To the south of the hall and old library are the foundation of the modern Meadow Buildings (1862-1865), overlooking the beautiful Christ Church Meadows, whose avenues lead to the Thames and Cherwell.

Corpus Christi College (commonly called Corpus) was founded in 1516 by Richard Fox, bishop of Winchester (1500-1528). He at first intended his foundation to be a seminary connected with St Swithin's priory at Winchester, but Hugh Oldham, bishop of Exeter, foresaw the dissolution of the monasteries and advised against this. Fox had especially in view the object of classical education, and his foundation, besides a president, 20 fellows and 20 scholars, included 3 professors—in Greek, Latin and theology—whose lectures should be open to the whole university. This arrangement fell into desuetude, but was revived in 1584, when fellowships of the college were annexed to the professorial chairs of Latin and jurisprudence. The foundation now consists of a president, 16 fellows, 26 scholars and 3 exhibitioners. The college has its front upon Merton Street. The first quadrangle, with its gateway, tower, is of the period of the foundation, and the gateway has a vaulted roof with beautiful tracery. In the centre of the quadrangle is a curious cylindrical dial in the form of a column surmounted by a pelican (the college symbol), constructed in 1581 by Charles Turnbull, a mathematician who entered the college in 1573. The hall has a rich late Perpendicular roof of timber; the chapel, dating from 1547, contains an altar-piece ascribed to Rubens, and the small library includes a valuable collection of rare printed books and MSS. The college retains its founder's crozier, and a very fine collection of old plate, for the preservation of which it is probable that Corpbus had to pay a very heavy tax. It is said that the cause of its smallness of the main quadrangle are the classical Turner buildings, erected during the presidency of Thomas Turner (1766), from a design attributed to Dean Aldrich. The picturesque college garden is bounded by the line of the old city wall. There are modern buildings (1888) by T. G. Jackson on the opposite side of Merton Street from the main buildings. Among the names connected with the college may be mentioned those of four eminent theologians—Reginald Pole, afterwards cardinal (nominated fellow in 1523), John Jewel, bishop of Salisbury (fellow 1542-1553), Richard Hooker (scholar, 1573) and John Keble (scholar, 1806). Thomas Arnold, the famous headmaster of Rugby school, was a scholar of the college (1811).

Exeter College was founded, as Stapeldon Hall, by Walter Stapeldon, bishop of Exeter, in 1314, but by the middle of the century it had become known as Exeter Hall. The foundation was extended by Sir William Petre in 1595. Stapeldon's original foundation for 12 scholars provided that 8 of them should come from Devonshire and 4 from Cornwall. There are still 8 school scholarships for persons born or educated within the county of Exeter. The college consists of a rector, 12 fellowships and 21 scholarships or more. There are also a number of scholarships and exhibitions on private foundations, several of which are limited in various ways, including 3 confined to persons born in the Channel Islands or educated in Victoria College, Jersey, or Elizabeth College, Guernsey. The college has its front, which is of great length, upon Turl Street. It has been extensively restored, and its gateway tower was rebuilt in 1793, while the earliest part of the quadrangle is Jacobean, the hall being an excellent example dating from 1618. The chapel (1857-1858) is an ornate structure by Sir Gilbert Scott; it is in Decorated style, of great height, with an eastern apse, and has some resemblance to the Sainte Chapelle in Paris. The interior contains mosaics by Antonio Salviati and tapestry by Sir E. Burne-Jones and William Morris. Scott's work is also seen in the frontage towards Broad Street, and in the library (1856). The college has a beautiful secluded garden between its own buildings and those of the divinity hall. The hall contains the library.

Hertford College, in its present form, is a modern foundation. There were formerly several halls on the site, and some time between 1283 and 1300 Elias of Hertford acquired one of them, which became known as Hert or Hart Hall. In 1312 it was sold to Bishop Stapeldon, the founder of Exeter, and was occupied by his scholars for a short time. Again, some of William of Wykeham's scholars were lodged here while New College was building. The dependence of the hall on Exeter College was maintained until the second half of the 16th century. In 1710 the Turl "takes its name from a postern (Turl or Thorold Gate) in the city wall, to which the street led."

OXFORD
Richard Newton, formerly a Westminster student of Christ Church, became principal, and in 1740, in spite of opposition from Exeter, he obtained a charter establishing Hertford as a college. The foundation, however, did not prosper, and by an inquiry of 1876 it was declared to have lapsed in 1805. With part of its property the university was able to endow the Hertford scholarship in 1834. Magdalen Hall, which had become independent of the college of that name in 1602, acquired the site and buildings of the dissolved Hertford College and occupied them, but was itself dissolved in 1874, when its principal and scholars were incorporated as forming the new Hertford College. An endowment was provided by Thomas Charles Baring, then M.P. for South Essex, for 15 fellows and 30 scholars, 7 lecturers and dean and bursar. The foundation now consists of a principal, 17 fellows and 40 scholars. Of the college buildings, which face those of the Bodleian library and border each side of New College Lane, no part is earlier than Newton's time. Modern buildings by T. G. Jackson (1903) incorporate remains of the little early Perpendicular chapel of Our Lady at Smith Gate (incorrectly called St Catherine's), which probably stood on the outside of the town ditch. There is a striking modern chapel, the Tanfield chapel, named after a benefactor. The college has always had an intimate association with Wales. Queen Elizabeth granted a charter to her chaplain, Hugh ap Rice (Price), a native of Brecon, who endowed the college. The original foundation was for a principal, 8 fellows and 8 scholars. It now consists of a principal and not less than 8 or more than 14 fellows, and there are 24 foundation scholarships, besides other scholarships and exhibitions, mainly on the foundation of Edmund Meyrick, a native of Merionethshire, who entered the college in 1656 and was a fellow in 1662. Not only his scholarships but others also are restricted (unless in default of suitable candidates) to persons born or educated in Wales, or of Welsh parentage. At Jesus, as at Exeter, there are also some "King Charles I." scholarships for persons born or educated in the Channel Islands. The college buildings face Turl Street; the front is an excellent reconstruction of 1856. The chapel dates from 1621, the hall from about the same time, and the library from 1677, being erected at the expense of the eminent principal (1661-1703) Sir Leoline Jenkins. He and his predecessor, Sir Eubule Thelwall (1607-1630), were prominent in raising the college to an equal footing with the other colleges. The college is modern; it received its charter in 1870. It was erected by subscription as a memorial to John Keble (q.v.). Its stated object was to provide an academical education combined with economical cost in living and a "training based upon the principles of the Church of England." The college is governed by a warden (who has full charge of the internal administration) and a council. There is a staff of tutors, and a number of scholarships and exhibitions on private foundations. The buildings lie somewhat apart from other collegiate buildings towards the north of the city, facing the university parks, which extend from here down to the river Cherwell. They are from the designs of William Butterfield, and are principally in variegated brick. The chapel has an elaborate scheme of decoration in mosaic; and the library contains a great number of books collected by Keble, and Holman Hunt's picture, "The Light of the World." Lincoln College was founded in 1427 by Richard Fleming, bishop of Lincoln. It was an outcome of the reaction against the doctrines of Wyclif, of which the founder of the college, once their earnest supporter, was now an equally earnest opponent. He entered in 1424; before his schemes were fully carried out, and the college was struggling for existence when Thomas Rotherham, while bishop of Lincoln and visitor of the college, re-endowed it in 1478. The foundation consists of a rector, 12 fellows and 14 scholars. The buildings face Turl Street. The hall dates from 1436, but its wainscoting within was added in 1701. The chapel, in the back quadrangle, is an interesting example of Perpendicular work of very late date (1630). The interior is wainscoted in cedar, and the windows are filled with Flemish glass introduced at the time of the building. There is a modern library building in a classic Jacobean style, completed in 1906; the collection of books was originated by Dean John Forest, who also built the hall. Among the eminent associates of this college was John Wesley, fellow 1726-1751.

Magdalen College (pronounced Maidlen; in full, St Mary Magdalen) was founded in 1458 by William of Waynflete, bishop of Winchester and lord chancellor of England. In 1448 he had obtained the patent authorizing the foundation of Magdalen Hall. In the college he provided for a president, 40 fellows, 30 demies,1 and, for the chapel, chaplains, clerks and choristers. To the college he attached a grammar-school with a master and usher. The foundation now consists of a president, from 30 to 40 fellowships, of which 5 are attached to the Waynflete professorships in the university,2 senior demies up to 8 and junior demies up to 35 in number. The choir, &c., are maintained, and the choral singing is celebrated. In order to found his college, Waynflete acquired the site and buildings of the hospital of St John the Baptist, a foundation or refoundation of Henry III. for a master and brethren, with sisters also, for "the relief of poor scholars and other miserable persons." The Magdalen buildings, which are among the most beautiful in Oxford, have a long frontage on High Street, while one side rises close to or directly above a branch of the river Cherwell. The chief feature of the front is the bell-tower, in style which for grace and beauty of proportion is hardly surpassed by any other of the Perpendicular period. It was begun in 1492, and completed in about thirteen years. From its summit a Latin hymn is sung at five o'clock on May-day morning annually. Various suggestions have been made as to the origin of this custom; it may have been connected with the inauguration of the tower, but nothing is certainly known. The college is entered by a modern gateway, giving access to a small quadrangle, at one corner of which is an open pulpit of stone. This was connected with the chapel of St John's Hospital, which was incorporated in the front range of buildings. Adjoining this is the west front of the college chapel. This chapel was begun in 1474, but has been much altered, and the internal fittings are in the main in the best modern work (1833 seq.). At the north-west corner of the entrance quadrangle is a picturesque remnant of the later buildings of Magdalen Hall. To the west is the modern St Swithin's quadrangle, the buildings of which were designed by G. F. Bodley and T. Garner, and begun in 1880, and to the west again a new chapel, which was begun in 1890. To the east lies the main quadrangle, called the cloister quadrangle, from the cloisters which surround it. These have been in great part reconstructed, but in accordance with the plan of the time of the foundation. Above the west walk rises the beautiful "founder's" tower, low and broad. On this side also is the valuable library. The south walk is bounded by the chapel and the hall, which lie in line, adjoining each other. The hall is a beautiful room, improved in 1906 by the substitution of an open timber roof for one of plaster erected in the 18th century. The panelled dates mainly from 1541; there is a tradition that the part at the west end came from the dissolved Reading Abbey. A curious series of figures which surmount the buttresses on three sides of the cloisters date from 1508-1509. Some are apparently symbolical, others scriptural, others again heraldic. To the north of the cloister quadrangle (a garden with broad lawns intervening) stand the so-called New Buildings, a massive classical range (1733). To the north and west of these extends the Grove or deer park, where the first deer were established probably c. 1720; to the east, across a branch of the Cherwell, is the meadow surrounded by Magdalen Walks, part of which is called Addison's Walk after Joseph Addison (deem and fellow). Perhaps the most notable period in the history of the college is that of 1687-1688, when the fellows resisted James II.'s attempt to force a president upon them, in place of their own choice, John Hough (1651-1743), successively bishop of Oxford.

1 Singular demy, the last syllable accented. They correspond to the scholars of other colleges. The name is derived from the fact that their allowance was originally half (demi-) that of fellows.

2 Waynflete himself had founded three readerships, in natural and moral philosophy and in theology.

3 It actually faces about N.W.; the same deviation applies to other buildings described.
Lichfield, and Worcester. Cardinal Wolsey was a fellow of the college about the time when the bell-tower was building, but the attribution of the design to him, or even of any active part in the erection, is not borne out by evidence. Among alumni of the college were William Camden, Sir Thomas Bodley, John Hampden, at the time of whose matriculation (1610) Magdalen was strongly Puritan, Joseph Addison, Dr Sacheverell, and for a short period Gibbon the historian. Mention should be made of the eminent president, Martin Joseph Routh, who was elected to the office in 1791, and held it till his death in his 100th year in 1854. Magdalen College school had new buildings opened for it in 1864.

Merton College is of peculiar interest as regards its foundation, which is generally cited as the first on the present collegiate model. At some time before 1264 Walter de Merton, a native of Merton, Surrey, devoted estates in that county to the maintenance of scholars in Oxford. Thus far he followed an established practice. In 1264 he founded at Malden a "house of scholars of Merton" for those who controlled the estates in the interest of the scholars, who should study preferably at Oxford, though any centre of learning was open to them. By 1268 the Oxford community had acquired the present site of the college in 1261. It was laid down that the statutes should be revised each term, and in 1264 the whole foundation was established under a final set of statutes at Oxford — i.e. the society ceased to be administered from the house in Surrey. The society was under a warden, and certain other officers were established, but no limit was set on the number of scholars. The foundation now consists of a warden, from 19 to 26 fellows, and 20 or more postmasterships. The postmasters of Merton correspond to the scholars of other colleges; they had their origin in the portionistsae (i.e. foundations who had a smaller portion or emolument than fellows), instituted in 1380 on the foundation of John Wylyott (fellow 1334, chancellor 1349). The college is adjacent to Corpus, with its front upon Merton Street, and some of its buildings are of the highest interest, notably the chapel and library. The chapel consists of a choir and transepts with a tower at the crossing; but a nave, though intended, was never built. The choir is of the purest Decorated workmanship (dating probably from the last decade of the 13th century), with beautiful windows exhibiting most delicate tracerie. The library and cloisters are of remarkable quality, and show how much the prototype of Perpendicular was influenced by the French. Although there is also work of the earlier style in them, the massive tower is wholly of the later period (c. 1450).

The library, which lies on two sides of the so-called "mob" quadrangle, dates from 1377-1378, and was mainly the gift of William Rede, bishop of Chichester (1360-1386). It occupies two beautiful rooms and is of great interest from its early foundation and the preservation of its ancient character. The treasury is a small room coeval with the foundation, with a curious high-pitched ashlar roof. The other buildings, which are of various dates, are mainly disposed about four quadrangles, including that of St Alban's Hall, which, possibly dating from the early part of the 15th century, was incorporated with Merton College in 1882. The college hall retains an original door with fine ironwork, but the building is in great part modernized. A beautiful garden lies east of the buildings, being separated from the meadows to the south by part of the old city wall. Modern buildings (1907) have a frontage upon Merton Street; others (1864) overlook the meadows. Traditionally the names of Roger Bacon, Duns Scotus and Wycliffe have been associated with it. Repton and Philip Sidney, the antiquary and historian of the university, was a postmaster of the college.

New College was founded by William of Wykeham in 1379. The founder's name for it, which it still bears in its corporate title, is the College of St Mary of Winchester. But there was already a St Mary's College (Oriel). Wykeham's house thus soon became known as the New College, and the substantive is still retained in the ordinary speech of the university, whereas in mentioning the titles of other colleges it is generally omitted.

1 He was chancellor of the kingdom in 1261-1263, and again in 1272-1274, justiciar in 1271 and bishop of Rochester in 1274. He died in 1277.

Wykeham designed an exclusive connexion between his Oxford college and his school at Winchester. This connexion is maintained in a modified form. Wykeham's foundation was for a warden, and 70 fellows and scholars, with chaplains and a choir. The present foundation consists of a warden, and not more than 36 fellows, while to the scholarships 6 elections are made annually from Winchester and 4 from elsewhere. The choir is maintained, as at Magdalen. Five of the fellowships were attached to university professorships, of which three (logic, ancient history and physics) are called Wykeham professorships. The buildings of New College remain in great measure as designed by the founder, and illustrate the magnificence of his scheme. The main gateway tower fronts New College Lane. The chapel and hall stand in line (as at Magdalen), on the north side of the front quadrangle. The period of building was that of the development of the Perpendicular style. In shape the chapel was the prototype of a form common in Oxford, consisting of a choir, with transepts forming an antechapel, but with no nave. The remarkable west window in monochrome was erected, c. 1378, from a design by Sir Joshua Reynolds. The reredos, with its tiers of figures in niches, had a history similar to that at All Souls College, Oxford, and was remodelled in 1567. In the same way, too, it was restored c. 1890; but perhaps James Wyatt, in 1799, discovered traces of the original, and had unsuccessfully attempted the restoration of the niches in plaster, carrying out also, as elsewhere in Oxford, other extensive alterations of which the obliteration was demanded by later taste. Portions of the old work were incorporated in the excellent new work of 1870 (Sir Gilbert Scott). In the chapel is preserved the beautiful pastoral staff of the founder, and there is a fine series of memorial brasses, mainly of the 15th century, in the antechapel. To the west of the chapel are the cloisters, consecrated in 1400, and the detached tower, a tall massive building on the line of the city wall. As already mentioned, a fine remnant of this wall adds to the picturesque ness of the college garden. The hall was completed in 1368, and has a Tudor screen and wainscoting. The garden quadrangle, the east side of which is open to the gardens, dates from 1682-1708. On the north side of the college precincts, facing Holywell Street, are extensive modern buildings by Sir G. G. Scott and B. Champneys. In 1642, when Oxford was play-
the one from Corpus; the other had been at Oriel. Again in 1815 Thomas Arnold, afterwards headmaster of Rugby, was elected from Corpus, with Renn Dickson Hampden of Oriel. Later fellows were John Henry Newman (1822) and Edward Pusey (1823). James Anthony Froude entered the college in 1835; Matthew Arnold became a fellow in 1845. Cecil John Rhodes matriculated in 1873, and, besides his foundation of Rhodes scholarships, made a large bequest to the college.

Pembroke College was founded in 1624. Thomas Tisdale (1547–1600) of Glympton, Oxfordshire, left money for the support of scholars in Oxford, indicating Balliol College as his preference, but not insisting on this. Richard Wightwick (d. 1630), rector of East Ilsley, Berkshire, added to Tisdale's bequest, and though Balliol College desired to benefit by it, James I. preferred to figure as the founder of a new college with these moneys. Pembroke, which was named after William Herbert, earl of Pembroke, then chancellor of the university, was thus developed out of Broadgates Hall, which had long been emblematic as the residence of students in law. The original college foundation was for a master, 10 fellows and 10 scholars, but a number of scholarships and exhibitions has been added by benefactors. Of the scholarships some are awarded by preference to candidates possessing certain qualifications, notably that of education at Abingdon school, which Tisdale intended to benefit by his bequest. The buildings of Pembroke lie south and west of St Aldate's Church, opposite Christ Church; they surround two picturesque quadrangles, but are in great part modern. The college preserves some relics of Samuel Johnson, who entered it in 1728.

Queen's College was founded in 1340–1341 by Robert de Eglesfield, chaplain of Philippa, queen-consort of Edward III., and was named in her honour. Her son, Edward the Black Prince, was entered on the books of the college, and Henry V. received education here. Several queens were among the benefactors of the college—Henrietta Maria, Caroline, Charlotte. The queen-consort is always the patroness of the college. The foundation consists of a provost, from 12 to 16 fellows, and about 25 scholars. There was formerly an intimate connexion between this college and the north of England. Five scholarships, called Eglesfield scholarships, are now given by preference to natives of Cumberland or Westmorland, and the Hastings exhibitions founded by Lady Elizabeth Hastings (1682–1739) are open only to candidates from various schools in these counties and in Yorkshire. This connexion dates from the foundation. Eglesfield (d. 1340) was probably a native of Eglesfield in Cumberland, and provided that the 12 fellows or scholars of his foundation were preferably to be natives of this county or Westmorland. During the time of Wycliffe, who while rector of Lutterworth resided for two years in the college, the foundation was by a ruling of the visitor (the archbishop of York) actually confined to the two counties mentioned, and so remained until 1854. The buildings date mainly from the close of the 17th century and the beginning of the 18th. The front of the present hall is with a classical screen, flanked by the ends of the east and west ranges of buildings of the front quadrangle, and surmounted in the centre by a statue of Queen Caroline under a cupola. The buildings are the work of Sir Christopher Wren and Nicholas Hawksmoor. The college contains a valuable collection, especially of historical works, and is fitted with wood-carving by Grinling Gibbons. There is also here an interesting contemporary statue in wood of Queen Philippa. The chapel retains several medieval windows from the former Gothic chapel, and some stained glass painted by Abraham van Lang (1635). The college preserves two early customs—on Christmas day a dinner is held at which a boar's head is carried in state into the hall, and an appropriate ancient carol is sung; and on New Year's day a threaded needle, with the motto "Take this and be thrifty," is presented to members in the college hall.

St John's College was founded in 1555 by Sir Thomas White, Kt., alderman of London (1492–1597). It occupied the site of a house for Cistercian students in the university, founded by Archbishop Chichele in 1417 and dedicated to St Bernard of Clairvaux. White's foundation was originally for a president, 50 fellows and scholars, and a chaplain, choirmaster, &c., for the chapel. White established the intimate connexion which still exists between his college and the Merchant Taylors' School in London, in the foundation of which, as a prominent officer in the Merchant Taylors' Company, he had a share. The college foundation now consists of a president, from 14 to 18 fellowships, not less than 28 scholarships, of which 15 are appropriated to Merchant Taylors' school, and 4 senior scholarships, similarly appropriated. The buildings incorporate some of Chicheley's work, as in the front upon St Giles's Street, with its fine gateway. Similarly, in the front quadrangle, the hall and chapel belonged to the house of St Bernard, though subsequently much altered. A passage with a rich fan-traceried roof gives access from the front to the back quadrangle, on the north and east sides of which is the library. The south wing dates from 1596, the east from 1631. The latter is of the greater interest; it was built at the charge of William Laud, and the designs have been commonly attributed to Inigo Jones. The north and west sides of the quadrangle, of the same period, have cloisters. The union of the classical style, which predominates here, with the characteristic late Perpendicular of the period, makes this quadrangle architecturally one of the most interesting in Oxford, as the college gardens, which its east front overlooks, are among the most picturesque. The most notable period of the history of the college is associated with Laud, who entered the college in 1589, was elected a fellow in 1593, became president in 1611 and chancellor of the university in 1629. Relics of him are preserved in the library, and he is buried in the chapel, together with White, the founder, and William Juxon, president 1621–1633, and afterwards archbishop of Canterbury.

Trinity College was founded in 1555 by Sir Thomas Pope, Kt. (d. 1550), of Tittenhanger, Hertfordshire. He acquired and used for his college the ground and buildings of Durham College, the Oxford house of Durham Abbey, originally founded in the 13th century (see DURHAM, city). Trinity is therefore one of the instances of collegiate foundation forming a sequel to the dissolution of the monasteries, for Durham had been surrendered in 1540. Pope's foundation provided for a president, 12 fellows and 12 scholars. There are now 16 scholarships and a number of exhibitions. There are also some scholarships in natural science, on the foundation (1873) of Thomas Millard, whose bequest also provides for a lecturer and laboratory. The front quadrangle of Trinity lies open to Broad Street; on its east side are modern buildings (by T. G. Jackson, 1887), on the north, the president's house and the chapel in a classic style, dating from 1694. It contains a rich alabaster tomb of Pope, the founder, and his third wife, and has a fine carved screen and altar-piece by Grinling Gibbons. The remainder of the buildings, forming two small quadrangles north of the chapel, includes parts of the old Durham college, but these have been much altered. The grounds are laid out in the Romantic manner, and the college was a commoner of this college; Edward Augustus Freeman, the historian, and William Stubbs, bishop of Oxford, were among its fellows.

University College (commonly abbreviated Univ.) has claimed to find its origin in a period far earlier than that to which the earliest historical notice of the university itself can be assigned. In a petition to Richard II., respecting a dispute as to property the members of the "mickel universite holl in Oxford" quote King Alfred as the founder of the house, for 26 divines. The date of 872 was claimed, and in 1872 a millenary celebration was held by the college. Moreover, in 1727 a dispute as to the mastership of the college led to an appeal to the Court of King's Bench to determine the right of visitation, and it was found that this right rested with the crown (as it now does) on the ground of the foundation by Alfred. Leaving tradition, however, it is found that William of Durham, archdeacon of Durham, dying in 1240, bequeathed money to the university to support masters at Oxford. In 1253 the university acquired its first
Oxford

The academical halls, which were of very early origin, were originally in the nature of lodging-houses, in which students lived under a principal chosen by themselves. But they were gradually absorbed by the colleges as these became firmly established. The only remaining academical hall is that of St Edmund, which is said to have been founded in 1226, and to derive its name from Edmund Rich, archbishop of Canterbury, who is known to have taught at Oxford, and was canonized in 1248. The hall came into the possession of Queen's College in 1557, and the principal is nominated by that society. The buildings, which form a small quadrangle east of Queen's College, date mainly from the middle of the 18th century. There are three private halls in Oxford, established under a university statute of 1882, which provides for such establishment by any member of convocation under certain conditions and under licence from the vice-chancellor. Non-collegiate students, i.e., members of the university, possessing all its privileges without being members of any college, were first admitted in 1868. As a body they are under the care of a deleycy and the supervision of a censor.

Women are admitted to lectures and university examinations but not to its degrees; they have four colleges or halls—Somerville College (1879), Lady Margaret Hall (1879), St Hugh's Hall (1886) and St Hilda's Hall (1893). Among foundations independent of university jurisdiction and intended primarily for the teaching of theology are the Pusey House (1884, founded in memory of Edward Bouverie Pusey), St Stephen's House (1876) and Wycliffe Hall (1878), both theological colleges; Mansfield College (Congregational, founded to take the place of Spring Hill College, Birmingham, in 1886) and Manchester College (1893), also a nonconfessional institution. The buildings, especially the chapel, should be noticed as of very good design in Decorated and Perpendicular styles. None of these houses is a residence for undergraduates. There is a theological college at Cuddesdon, near Oxford, where also is the bishop of Oxford's palace.

A notable group of buildings connected with the university stands between Broad Street and High Street, and between Exeter and Brasenose and All Souls colleges. Among these the principal are the old schools buildings, which form a fine quadrangle, and are now mainly occupied by the Bodleian Library, more extensive accommodation for the schools (examinations, &c.) being provided in the modern range of buildings facing High Street. The Bodleian Library was remodelled in 1882 from the designs of T. G. Jackson. The erection of the old schools quadrangle was begun in 1613, and the architecture combines late Gothic with classical details. On the inner face of the gateway (formerly the Water Gate), some coats of arms of the colleges are seen. The windows, parapet and rich pinnacles, however, are Gothic. The quadrangle was founded by Sir Thomas Bodley, who conceived the addition of schools to the celebrated library which bears his name. The main chamber of the Bodleian Library is surrounded by the quadrangle. The library (see Libraries) was opened in 1602. The central part of the room dates from 1480, when it was completed to contain the library given to the university by Humphrey, duke of Gloucester (d. 1447). This library was destroyed in the time of Edward VI. Bodley added the east wing, the west wing followed in 1634–1649, being built to house the collection of John Selden, one of the principal of many benefactors of the library. The whole of the building was burned in the fire of 1872, and has since been reconstructed by the finely painted ceiling and the excellent design of the fittings. In the storey above the library is the picture-gallery, containing portraits of chancellors, founders and benefactors of the university. The basement of the central staircase hall of the old Schools building (1613), in which the most notable feature is the groined roof, divided into compartments by widely splayed arches, and adorned with rich tracery and carved pendants. The Convocation House, below the west wing of the library, and entered from the front of the school, has a roof with fan tracery. To the north of these buildings, flanking Broad Street, are the Sheldonian Theatre, the old building of the Clarendon Press and the Old Ashmolean building.

Worcester College was founded in its present form in 1714, out of a bequest by Sir Thomas Cookes, Bart. (d. 1701) of Bentley Pauncefoot, Worcestershire. On part of the site, in 1283, Gloucester Hall had been founded for Benedictine novices from Gloucester. After the dissolution of the monasteries, the buildings were used by Robert King, first bishop of Oxford, as a palace (1542); later it was acquired by Sir Thomas White, founder of St John's College, and again became a hall. This fell into difficulties, and was in great poverty when the present foundation superseded it. Cookes's foundation provided for a provost, 6 fellows and 6 scholars; there are now from 6 to 10 fellows, and from 10 to 18 scholars. Four of the scholarships are appropriated to Bromsgrove school, of which Cookes was a benefactor. The frontage of the buildings, in Worcester Street, is in a classical style, but the quadrangle retains some of the old buildings of Gloucester Hall. The gardens, with their lake, are fine.

1 The year in which the statutes were issued; Dorothy Wadham had received the royal charter in 1610.

1 This title was given by a statute of 1884.
early established in its upper part. This institution bears the name of the Clarendon Press from the fact that it was founded partly from the proceeds of the sale of the works of Clarendon's History of the Rebellion, the copyright of which was given to the university by his son. From the Clarendon Press moved to its present site in 1840, for it close to the theatre; in 1830 it was moved to the larger building it now occupies in Walton Street. Printing in Oxford dates from the seventh or eighth decade of the 13th century, but was only carried on temporarily and part-time, the business under the firm of the printer was Joseph Barnes. All the subsidiary processes of type-founding, stereotyping, &c., are carried on in the buildings of the press, and paper is supplied from the university mill at Wolvercote. The Office of the University Press, a small building, contains the offices of the university has a preponderating influence, governing it through a delegacy. The Broad Street building is used for other purposes of the university, as is the adjacent Ashmolean building, which originally (1677) was the Ashmolean Dispensary, and which house the Ashmolean Museum, a fine example of Perpendicular work. The main entrance from Broad Street now affords rooms for the School of Geography (1890).

To the south of the old schools, between Brasenose and All Souls colleges, is the fine classical rotunda known as the Radcliffe Library or camera, founded in 1737 by the eminent physician John Radcliffe (1673-1744). This building was a fine Decorated tower and spire, dating from the early part of the 13th century. The body of the church, however, is an excellent example of Perpendicular work. The main entrance from Broad Street now affords rooms for the School of Geography (1890).

The Radcliffe camera has served various purposes connected with the university, including that of housing a library before the foundation by Humphrey, duke of Gloucester. The university sermons are preached in St Mary's church.

A massive pile of classical buildings (1845) at the corner of Beaumont and St Giles's Streets is devoted to the Taylor Library, the University Galleries and the Ashmolean Museum. Sir Robert Taylors's building contains the union of the two issues of modern European languages in Oxford, and to provide a building for the purpose, and the eastern wing is devoted to the purpose, containing a library. In the University Galleries the most notable features are the celebrated Arundel marbles, a large series of drawings, for pictures by Raphael and Michelangelo, and models for busts and statues by Sir Francis Chantrey. The new building for the Ashmolean Museum was added in 1893; and in connexion both with the collection and with subsequent additions to the collections the benefactors, Countess of Chatham, Duke of Portland, etc., (1870), funded the Radcliffe Camera Foundation (1871) to be remembered. The nucleus of this collection was formed by John Tradescant, a traveller and botanist (1608-1662), who left to Elias Ashmole (Mr.), who added books, paintings and other objects, and preserved them until his death in 1700. When the museum was moved from the Old Ashmolean building, the collection was in great part distributed; thus, books were sent to the Bodleian Library, and natural objects to the University Museum. The Radcliffe Library is an extensive building close to the parks, opposite Keble College. Its foundation was the outcome of the necessity of keeping pace in the university with the extended range of modern scientific study. It was added to the Radcliffe Camera, (1713) in perpetuity, and its own busts referred to the collection of Augustus Henry Lane Fox Pitt-Rivers, presented to the university in 1883. Additional buildings contain the Radcliffe Library and various laboratories. The university observatory is in the gardens at the north-west corner of the Radcliffe Square, and is called the Radcliffe (1772-1795), built by the trustees of the Radcliffe bequest, as was the Radcliffe Hotry (1770) standing near the observatory, in Woodstock Road. Opposite Magdalen College, by the Herberts, and is the home of the University Press. It was then, by Henry Davers, Earl of Danby, in 1622, where are connected a library, herbarium and museum. The Indian Institute (1882), in Broad Street, was founded as a centre for the study of Indian subjects, and for the use of Indian students in the university and prospective Indian civil servants. The Oxford Union Society, the principal university club, founded in 1825, has its rooms, with library and debating hall, near Cornmarket Street.

Ancient buildings in Oxford, apart from collegiate and university buildings, are mainly ecclesiastical, but there are a few notable exceptions. The castle, which, as already indicated, was erected by Robert d'Oli in the west of the ancient city, remains standing. To the north of it was the Hospital of the Holy Trinity. King's palace in St Aldate's Street may be mentioned; it has been in great part defaced by modern alterations, but the remains of the front is a beautiful half-timbered and gabled example dated 1628; and in the same street is a fine house, now used as a residence, of the Bishop of Oxford. There are some of the remains from the original dedication in the time of Edward V. The building in High Street is another fine house, now used as a private residence, but formerly occupied by the college used, having been built by Ralph Kettell, president of the college (1588-1603). Among ancient churches in Oxford, after the cathedrals of St Mary and St Peter, the cathedral of St Mary Magdalen, St Alde's, St Ebbe's and St Thomas the Martyr are all of some antiquarian interest in spite of extensive modern alteration. Only the 14th century tower remains of St Mary Magdalen. St Albans, the deanery church, was a complete reconstruction of 1820, being removed at the close of the century, in the course of town-widening. Some of the modern churches are on sites of early dedication. The church of St Mary Magdalen, south of the High Street, is a new building and has served various purposes connected with the university, including that of housing a library before the foundation by Humphrey, duke of Gloucester.

University constitution and administration.

The Chancellor of the University of Oxford is a person who was an active part in the details of administration, delegating this to many individual corporations. The university is governed by statutes of its own making, which were codified and brought out of the confusion into which they had fallen in the course of centuries in 1636, during Laud's chancellorship. A commission was appointed to inquire fully into the constitution of the university. In 1850 it was reported in 1852, and in 1854 the constitution was amended by the Oxford University Act. In 1876 another commission was appointed, and in 1877 the Universities of Oxford and Cambridge and Durham were united in one Act. The commission who (1882) made statutes for each college, excepting Hertford, Keble and Lincoln, the first and second of which are modern foundations, while the third is governed under statutes of 1836, each of which other and is governed by the members of convocation, holds office for life, and is generally a distinguished member of the university. The principal duty of the public is that of presenting those who are to receive an honorary master's degree, and of making speeches on the occasion. The only other duty is the appointment of the registrar as the recorder of the various administrative bodies of the university, and the secretary to the Board of Faculties has similar duties with regard to these boards, his work being closely associated with that of the vice-chancellor. The vice-chancellor has no civil jurisdiction in cases in which one of the parties is a resident member of the university. The university returns two members (burgesses) to parliament, the privilege dating from 1604. The University of Oxford is constitution of the chancellor, vice-chancellor, immediate ex-vice-chancellor and proctors as official members, and of eighteen other members (heads of houses, professors, &,c.) elected for terms of six years by the congregation of the university. The council takes the initiative in promulgating, from Greek 

1. From Greek ἱσχύω, the number seven; the Hebdomadal Board instituted in 1631 was appointed to hold a weekly meeting.
discussing and submitting to Convocation all the legislation of the university. The Ancient House of Congregation consists of "regents," i.e. doctors and masters of arts for two years after the term in which they take their degrees, professors, heads of colleges and officers. The members of the House are concerned with education and discipline in the university, but it now has practically no functions beyond the granting of degrees. It lost its wider powers under the act of 1854, when the Congregation of Doctors and Scholars was abolished; which it had possessed since the time when certain officials all members of Convocation who have resided for a fixed period within one mile and a half of Carfax, approves or amends legislation submitted by the Hebdomadal Council previously to its sitting. The powers of Convocation in the election of the various administrative boards. The House of Convocation consists of all masters of arts and doctors of the higher faculties who have their names on the university books, and has the final control over all acts and business of the university. There are also two officers chosen for the better direction of the library chest and other institutions, delegates of the common university fund, the museum, and the press, for extension teaching, local examinations and other similar purposes, visitors for the Ashmolean Museum, and the council of the University Press. Among the other bodies. There are boards for the following faculties: theology, law, medicine, natural science and arts (including literae humaniores, oriental languages and modern history). Among the numerous publications by the academic chairs in these faculties are the Oxfords, the oldest foundation is the Margaret professorship of history, founded in 1502 by Margaret, countess of Richmond and mother of Henry VII. This was followed by the five Regius professorships of history, civil law, medicine, Hebrew and Greek, founded by Henry VIII. in 1546. The colleges, as already seen, consist of a head, whose title varies in different colleges, fellows (who form the governing body) and students (who are admitted to residence). There be academics, "on the foundation," i.e. those who either receive no emoluments, or hold exhibitions which do not (generally) entitle them to rank with the scholars. The college officer who is immediately concerned with the academic life of the college is the warden (in the case of the pupilli is the dean (except at Christ Church). Each undergraduate (this term covering all who have not yet proceeded to a degree) is, as regards his studies, under the immediate supervision of one of the masters of arts of the college. There are four terms (which begins the academic year, and is therefore the term in which the majority of undergraduates begin residence), Hilary or Lent, Trinity, and Easter and Trinity. The last two run consecutively without interval for four months. College connections are kept by three weeks' residence in each, while the first two are kept for residence in each, though the terms properly speaking are longer. The examinations required to be passed in order to obtain the first or bachelor's degree may be summarized thus: (a) Responses, usually to a reading list of the Old Testament, and the New Testament (152 years ago); (b) First public examination or School of Maitlands; and (c) a private examination. After a public examination or final school (this in the case of literae humaniores is commonly called "Greats") usually takes place at the end of the fourth year of residence. "Pass" schools and "honour" schools are both held by the colleges at the end of the second and third years, the former for students not recommended for the latter. Many cases arise where a candidate has passed a certificate examination held by university examiners at the school where he has been educated. (b) First public examination or School of Maitlands; and (c) a private examination. After a public examination or final school (this in the case of literae humaniores is commonly called "Greats") usually takes place at the end of the fourth year of residence. "Pass" schools and "honour" schools are both held by the colleges at the end of the second and third years, the former for students not recommended for the latter. Many cases arise where a candidate has passed a certificate examination held by university examiners at the school where he has been educated. The twenty-four councillors who were to meet at Oxford for this purpose five weeks later. Twelve of these councillors were chosen by the king, and twelve by the head and forty. The purpose of the committee was to comprise four was empowered, subject to the approval of the whole body, to elect a king's council of fifteen members. The twenty-four then provided that the new council should meet three times a year in parliaments to which twelve commissioners were to be summoned to discuss the affairs of the realm on behalf of the whole community. Another body of twenty-four was appointed to treat of an aid, which was probably the aid which had been demanded earlier in the year. On the 22nd of June the king appointed new wardens of some of the castles which were then in the custody of his Polevins, brothers and their friends, and on the same day he gave directions that the twenty-four should proceed with the work of reform, and the committee of four with the election of the council of fifteen. Meanwhile it was provided that the sheriffs and the three great officers of state were to hold office for a year only, and to render account to the crown of the state. The assembly, on the 24th of August, in pursuance of a provision by the parliament, the king directed the fourteen knights in each county to inquire into the trespasses and wrongs which had been committed by sheriffs, bailiffs and other officials. For many of the grievances of the barons the Oxford parliament provided no remedy; and they were only partly redressed by the Provisions of Westminster in the autumn of 1259. The king declared his adhesion to the Provisions of Oxford on the 18th of October by proclamations in English, French and Latin, but in 1261, having obtained a papal dispensation from his oath of observance, he entirely repudiated them. The barons, however, insisted on his obligation
to observe the provisions and the dispute was eventually referred to the arbitration of Louis IX. of France, who formally annulled them on the 23rd of January 1264, but expressly declared that his decision was not to touch the privileges, liberties and laudable customs of the realm of England, which had existed before the time of the provisions.

No official record of the Provisions of Oxford has been preserved, and our knowledge of them is chiefly derived from a series of notes and extracts entered in the Annals of Burton Abbey, which are probably neither exhaustive nor in correct order. See the Annals monograph (Gloucestershire); L. E. Lloyd, Rolls ser.; Patent Rolls, Henry III. (printed text); Foederer (Record Commission edition); W. Stubbs, Constitutional History and Select Charters, and Charles Bismont, Simon de Monfort (1884).

OXFORDIAN, in geology, the name given to a series of strata in the middle Oolites which occur between the Corallian beds the and the Cornbrash; the division is now taken to include the Oxford Clay with the underlying Callovian stage (q.e.). The argillaceous beds were called "Clunch Clay and Shale" by William Smith (1815-1816); in 1818 W. Buckland described them under the unwieldy title "Oxford, Forest or Fen Clay." The term Oxfordian was proposed by d'Orbigny in 1844. The term is derived from the English county of Oxford, where the beds are well developed, but they crop out almost continuously from Dorsetshire to the coast of Yorkshire, generally forming low, broad valleys. They are well exposed at Weymouth, Oxford, Bedford, Peterborough, and in the cliffs at Scarborough, Red Cliff and Gristhorpe Bay. Rocks of this age are found also in Ug and Skye.

The Oxford Clay is usually bluish or greenish-grey in colour, weathering brown or yellow; in the lower portions it is somewhat more shaly. The beds frequently tend to be calcareous and bituminous, while in places there is a noticeable absence of Lower Cretaceous Sequentia. In southern England, the beds have been cut and polished at Radipole and Melbury Osmund in Dorsetshire, where they are known as Melbury marble or "turtle-stones"; they were used to form table-tops, etc. In Yorkshire the Oxford Clay is usually a grey limestone, and in the central and southern English counties the Oxford Clay is divisible as follows:

| Upper zone of | Lower zone of | Oxfordsian ornam |
|--------------|--------------|----------------|--|
| Cardioceras ordulum | Clays with septa and ironstone nodules | Clays with mollusk fragments (Druemias testa) | Shales with pyritised fossils (subzone of Coenoceras Jasnon) |
| Cardioceras ornatum | Upper zone contains also Gryphaea dilatata (large forms) | Serpulites, Bivalvalia hastata, Aspidoceras peronii, Cardioceras virehale. | The lower zone yields Rheimkins anser, Pseudoceras atlantis, Quenstedtioidea Marie, Coenoceras Jasnon, Cerithium marcatum, and a small form of Gryphaea dilatata. The remains of the range terminate with Coenoceras Jasnon. |

The Oxford Clay is dug for brick-making at Weymouth, Trowbridge, Chippenham, Oxford, Bedford, Peterborough and Fletton. The "Oxfordian" of the continent of Europe is divided according to A. de la Beche's classification into the "Azeguy" (Argovian) and a lower (Neuvizyen) substage. In the former he includes part of the English Coraline Oolite and in the latter the lower Calcarea Cretaceous, while a portion of the lower Oxford Clay is placed in the Devonian or upper substage of the Callovian. In north-west Germany the Oxford Clay is represented by the Marnes Marneux, Marnes of the Oxford Clay on this horizon are clays and marls with occasional limestone and ironstone beds.

See JURASSIC, CALLOVIAN, CORALLIAN.

OXFORDSHIRE (or Oxon), an inland county of England, bounded N.E. by Northamptonshire, N.W. by Warwickshire, W. by Gloucestershire, S.S.W. and S.E. by Berkshire, and E. by Buckinghamshire; area 755,7 sq. m. The county lies almost wholly in the basin of the upper Thames. This river forms its southern boundary for 71 m., from Kelmscot near Lechlade (Gloucestershire) to Remenham below Henley-on-Thames, excepting for very short distances at two points near Oxford. The main stream is the Thames proper, but it is joined by two major tributaries; the Cherwell and the Windrush. The principal tributaries joining the Thames on the Oxfordshire side do not in any case rise within the county, but have the greater part of their courses through it.

These tributaries are as follows, pursuing the main river downwards. (1) The Windrush, rising in Gloucestershire, follows a narrow and pleasant valley as far as Witney, after which it meanders in several branches through rich flat country, to join the Thames at Newbridge. (2) The Cherwell, also rising in Gloucestershire, forms the western county boundary for a short distance, and follows a similar but more beautiful valley to the Thames below Eynsham. From the north it receives the Glyme, which joins it on the confines of Blenheim Park, where the woodland scenery is of peculiar richness. (3) The Cherwell, rising in Northamptonshire, forms some 10 m. of the eastern boundary, and with a straight southerly course joins the Thames at the point of junction of the Thames and the Ouse, which drains the flat tract of Oo Moor. (4) The Thames, rising in Buckinghamshire, runs south-west and west, forming 6 m. of the eastern boundary, after which it turns south to join the Thames near Oxford, where it becomes a great river, and broadens out as it is often called the Isis. Lastly, a small part of the north-eastern boundary is formed by the Great Ouse (which discharges into the North Sea), here a very slight stream, some of whose head-feeders rise within Oxfordshire.

The low hills which lie south of the Windrush, and those between it and the Evenlode (which attain a greater height) are the foothills of the Cotswold range, which extends from Gloucestershire to Oxfordshire, to inert clay, and the bed of which lies in Gloucestershire. Between the Windrush and Evenlode they are clothed with the remaining woods of Wyckwood Forest, one of the ancient forests of England, which was a royal preserve from the time of John, and was disafforested in 1262. Its extent was 375,5 acres of forest proper. The hills continued north of the Evenlode (but not under the name of Cotteswold) at an average elevation over 500 ft. The range terminates at Edge Hill, just outside the county in Warwickshire. The hills bordering the Cherwell basin on the east are of slight elevation, until, running east from Oxford into Buckinghamshire, a considerable line of heights is found north of the Thames valley, reaching 560 ft. in Shotover Hill, overlooking Oxford. Across the south-east of the county stretches the bold line of the Chiltern Hills, running N.E. and S.W. On the western brow, Nettlebed Common, an extensive plateau, reaches at some points nearly 700 ft. of altitude. The district was probably once covered with forest, and there are still many fine beeches, oaks and ash trees. William Camden in his survey of the British Isles (1586) mentions forests as a particular feature of Oxfordshire scenery, and there are traces still left of natural woodland in various parts of the lower country.

The Thames flows through a deep gap from about Goring downwards, between the Chilterns and the Berkshire Downs. Here, as above at Nuneham and other points, the sylvan scenery is fine, and Henley and Goring are favourite riverside resorts on the Oxfordshire shore. The western feeders of the Thames and Cherwell have much rich woodland in their narrow valleys, and the sequestered village of Great Tew, on a tributary of the Cherwell river, may be singled out as having a situation of exceptional beauty.

Geology.—The influence of the rocky substratum upon the character of the scenery and soil is clearly marked. It is sufficient to point out that the Oxford Clay and the nearer Chalk Hills, with the oolitic limestone hills in the north-west, or the Cornbrash with its rich, fertile soil; and, on the other hand, to the dreary scenery of the Oxford Clay land with its cold, unproductive soil. The Oxford rocks occupy the south-eastern corner of the county; Jurassic rocks prevail over the remainder of the county; the Jurassic rocks are not present on the south-eastern boundary of the county, and thus towards the south-east, and the-straight of the strata is S.W.-N.E.; therefore in passing from south to north, beds are traversed which are successively lower and older. The Chiltern Hills, with a strong scarp at the foot of the chalk cliffs, are the most striking feature of the landscape. In the central and southern parts of the county the beds at the foot and hard chalk rock at the summit; from the top of the hills the Upper Chalk-with-Flints descends steadily towards the Thames. Here and there, as at Shiplake and Nettlebed, outliers of the Chalk cliffs reach the surface, forming a large feature at the foot of the chalk hills; this is succeeded by the Gault, with an outcrop varying from 4 m. to 14 m. wide, between Dorchester and Sydenham: it is a pale blue clay, dug for bricks at Countess and at Aspley, and for cement at the junior town of Gault, near Attenborough and Nuneham Courtenay and in outliers north of Cuddesdon. The Kimmeridge clay, in the grass-covered vales between Sandford and Waterperry, is separated from the Lower Greensand by a line of limestone and Portland sands and by the thin Purbeck beds: it is dug for bricks at Headington. Both Purbeck and Sandford beds may be observed in Shotover Hill; the Portland limestone is quarried at Garsington. The Corallian with a calcareous gneiss at the mead, is a shelly, chalky, clay, traceable from Sandford to Wheatley; it has been extensively quarried at Headington Hill. North-west of the last-formed granite, a broad outcrop of Oxford Clay crosses the county: while this is mostly under pasture, the next lower formation, the Corbrook, a brownish bluish limestone, gives rise to a loose coarsely suitable for the cultivation of wheat. Exposures of Cornbrash occur at Norton...
OXFORDSHIRE

Bridge, Woodstock and Shipton; it forms a broad plateau between Middleton Stoney and Bicester. Inliers also lie in the Oxford Clay plain at Islip, Charlton, Merton and Black Horse Hill. Wychem Forest has given its name to the Forest of Marke, an inconstant series of limestones which thin out eastward and become hard limestones. The Great Oolite limestones, with the "Stonefield Slate" at the base and occasional marls, form the higher ground in the north-west. An excellent freestone is quarried at Tainton and Milton. The flints of the Cretaceous series are worked at Catfoss, Rising and caps Shenlow and Epwell hills; it also reaches down to Chipping Norton and eastward to Steeple Aston. The three divisions of the Lias are represented in the N.W. of the county. The most impervious rocks are the upper flints, and the calcareous bed at the top, forms an elevated ridge along the limit of the outcrop. The marlstone is quarried for building stone at Horton, and for road metal in many places, and, as it contains a considerable amount of iron oxide, it has been extensively worked for iron. The county is, however, sparsely wooded. There are large areas of moor and rough country, which occur mostly as unimportant outliers. The Lower Lias clays have been exposed by the Evenlode near Charlbury and by the Cherwell in the upper part of its valley. A hard shelly limestone called Banbury marble occurs in this part of the Lias. The Intermediate Lias is sparsely scattered over the south-western part of the county, but is more plentiful in the north-eastern portion. Valley gravels are associated with the main stream courses and gravel, clay-with-flints and similar materials occur of the Lias. The Great Oolite Measures have been proved at a depth of about 1200 ft. near Burford.

Climate and Agriculture.—The climate is healthy and generally dry except in the low ground bordering the Thames, as at Oxford; but there is a certain amount of overcast, especially in the bleak and exposed regions of the Chilterns. Crops are later in the uplands than in more northerly situations at a lower elevation. In the northern districts there is a strong yet friable loam, well adapted to field crops, and also good chalk and clays for the most part by a good friable but not so rich soil, formed of decomposed sandstone, chalk and limestone. A large district in the south-east is occupied by the chalk of the Chiltern Hills, partly wooded, partly arable and partly heathland. The main agricultural county is occupied by a variety of miscellaneous soils ranging from coarse sand to heavy tenacious clay, and occasionally very fertile. Nearly seven-eighths of the area of the county, a high proportion, is under cultivation. The acreage under grass is 417,620 acres, including the fallow and meadows. The county has a very large area of clover, and is one of the greatest producers of hay and cheese. There is a considerable acreage under beans. More than half of the total acreage under green crops is occupied by turnips, and vetches and tares are also largely grown. Among the smaller staple crops, buckwheat and the corns are especially important. The country is famous for its hay and cheese. The acreage of the county is 436,626 acres, with a population in 1891 of 185,240 and in 1901 of 181,120. The area of the administrative county is 486,672 acres. The municipal boroughs are Banbury (pop. 12,608), Chipping Norton (5759), Henley-on-Thames (5984), Oxford, and Woodstock (8684). The urban districts are Bicester (3025), Caversham (6580), Thame (2911), Wheatley (872), Witney (1574), Bampton (1167) and Burford (1146) in the west, and Wallingford (1154) in the south-east, are the other principal country towns. The county is in the Oxford circuit, and assests are held at Oxford. It has one court of quarter-sessions, and is divided into 11 petty sessional divisions. The borough of Banbury and the city of Oxford have separate courts of quarter-sessions and commissions of the peace, and the borough of Henley-on-Thames has a separate commission of the peace. The total number of civil parishes is 304. Oxfordshire is in the diocese of Oxford, and contains 244 ecclesiastical parishes or districts, wholly or in part. The ancient county is divided (since 1885) into three parliamentary divisions: Banbury or northern, Woodstock or mid, and Henley or southern, each returning one member. It also includes part of the parliamentary borough of Oxford, returning one member, in addition to which the university of Oxford returns one member.

Education.—On account of the famous university of Oxford and other educational institutions there, the county as regards education holds as high a position as any in England. In connexion with the university there is a day training college for schoolmasters, and the secretary of Oxford a residential college for schoolmasters and mistresses (diocesan), which takes day students. There is a training college for schoolmasters in the dioceses of Oxford and Gloucester, at Culham. At Cuddesdon, where is the palace of the bishops of Oxford, there is a theological college opened in 1858. At Bloxham is the large grammar school of All Saints, and there are several boys' schools in Oxford.

History.—The origin of the county of Oxford is somewhat uncertain; like other divisions of the Mercian kingdom, the historical boundaries were entirely wiped out, and the district was renamed after the principal town. The boundaries, except for the southern one, which is formed by the Thames, are artificial. There are fourteen hundreds in Oxfordshire, among them being five of the Chiltern hundreds. The jurisdiction over these five belonged to the manor of Benson, and in 1199 to Robert de Harecourt, a name which is still to be found in the county in the Harcourt family. At Burford, and in the hundreds of Banbury, Thame, and Burford, the Bishop of Oxford held the feudal barony, as at the other bishop's diocesan jurisdictions. There has been little change in the county boundary; but acts of William IV. and Victoria slightly increased its area.

The district was overruled in the 6th century by the victorious West Saxons, who took Benson and Eynsham, as may be seen in the Saxon Chronicle for 571. In the 7th century the Mercian kingdom held all the northern border of the Thames, and during the 8th century this district twice changed hands, falling to Wessex after the battle of Burford, and to Mercia after a battle at Benson. As part of the Mercian kingdom it was included in the diocese of Lincoln. A bishopric had been established at Dorchester as early as 634, when Birinus, the apostle of Wessex, was given an episcopal seat there, but when a bishop was established at Winchester this bishopric seems to have come to an end. Before the Mercian conquest in 777, Oxfordshire was in the diocese of Sherborne. In 873 the jurisdiction of Dorchester reached to the Humber, and when the Danes were converted they extended their jurisdiction over Lincoln and Nottingham, and Lincolnshire, Oxfordshire forming an eighth of the diocese. At the conquest that was divided into the five counties of Berkshire, Buckinghamshire, and Oxfordshire, and the Oxford district was transferred to Lincoln. In 1542 a bishopric of Osney and Thame was established, taking its title from Oxford, the last abbot of Osney being appointed to it. In 1566 the existing bishopric of Oxford was established. The ecclesiastical boundaries remain as they were when archdeacons were first appointed—the county and archdeaconry being conterminous—and the county being almost entirely in the diocese of Oxford. The Danes overran the district during the 11th century; Thurlkill's army burnt Oxford in 1010, and the combined armies of Swyn and Ola crossed Watling Street and ravaged the district, Oxford and
Oxfordshire

Winchester submitting to them. In 1068 Danes and Englishmen chose Edgar's law at an assembly in Oxford, and in 1069, on Canute's death, his son Harold was chosen king. Here also took place the stormy meeting following the assembly (genot) at Northampton, in which Harold allowed Tostig to be outlawed and Morkere to be chosen earl in his place, thus preparing the way for his own downfall and for the Norman Conquest. The destruction of houses in Oxford recorded in the Domesday Survey may possibly be accounted for by the ravages of the rebel army of Eadwine and Morkere on this occasion, there being no undisputed mention of a siege by William. Large possessions in the county fell to the Conqueror, and also to his rapacious kinsman, Odo, bishop of Winchester. The bishop of Lincoln also had extensive lands therein, while the abbeys of Abingdon, Osney and Godstow, with other religious houses, held much land in the county. Among lay tenants in chief, Robert D'Oilly, heir of Wigod of Wallingford, held many manors and houses in Oxford, of which town he was governor. The importance of Oxford was already well established; the shire moot there is mentioned in Canute's Oxford laws, and it was undoubtedly the seat of the county court from the first; the castle being the central point. The principal historical events between this period and the Civil War belong less to the history of the county than to that of the city of Oxford (q.v.). The dissolution of the monasteries, though it affected the county greatly, caused no general disturbance.

When King Charles I. won the first battle of the Civil War at Edgehill (23rd of October 1642), Oxford at once became the material and moral stronghold of the royalist cause. Every manor house in the district became an advanced work, and from Banbury in the north to Marlborough in the west and Reading in the south the walled towns formed an outer line of defence. For the campaign of 1643 the rôle of this strong position was to be the detention of the main parliamentary army until the royalists from the north and west could come into line on either hand, after which the united royal forces were to close upon London on all sides, and in the operations of that year Oxfordshire successfully performed its allotted functions. No serious breach was made in the line of defence, and more than once, notably at Chalgrove Field (18th of June 1643), Prince Rupert's cavalry struck hard and successfully. In the campaign of Newbury which followed, the parliamentary troops under Essex passed north Oxfordshire on their way to the relief of Gloucester, and many confused skirmishes took place between them and Rupert's men; and when the campaign closed with the virtual defeat of the royalists, the fortresses of the county offered them a refuge which Essex was powerless to disturb. The following campaign witnessed a change in Charles' strategy. Realizing his numerical weakness he abandoned the idea of an envelopment, and decided to use Oxfordshire as the stronghold from which he could strike in all directions. The commanding situation of the city itself prevented any serious attempt at investment by dividing the enemy's forces, but material wants made it impossible for Charles to maintain permanently his central position. Plans were continually resolved upon and cancelled on both sides, and eventually Essex headed for the south-west to face the king alone. The battle of Cropredy Bridge followed (20th of Jan.), and the victorious king turned south to pursue and capture Essex at Lostwithiel in Cornwall. In the remaining operations of 1644 Oxfordshire again served as a refuge and as a base (Newbury and Donnington). With the appearance on the scene of Cromwell and the New Model army a fresh interest arose. Having started from Windsor on the 20th of April 1645, the future Protector carried out a daring cavalry raid. He caught and scattered the royalists unawares at Islip; then he pursued the fugitives to Bletchington and terrified the governor into surrendering. He swept right round Oxford, fought again at Bampton, and finally rejoined his chief, Fairfax, in Berkshire. A few days later Charles again marched away northwards; while Fairfax was ordered to besiege Oxford. In spite of the difficulties of the besiegers Charles was compelled to turn back to relieve the city, and the consequent delay led to the campaign and disaster of Naseby. Yet even after Naseby the actual position of Oxfordshire was practically unshaken. It is true that Abingdon with its parliamentary garrison was a standing menace, but the districts east of the Cherwell and Thames, and the triangle bounded by Oxford, Faringdon and Banbury, still retained its importance, till early in 1646 the enemy closed from all sides on the last stronghold of royalism. Stow-on-the-Wold witnessed the final battle of the war. On the 9th of May Banbury surrendered, and two days later Oxford itself was considerably invested. On the 24th of June the city capitulated, and three days later Wallingford, the last place to give in, followed its example.

The war left the county in an exceedingly impoverished condition. Its prosperity had steadily declined since the early 14th century, when it had been second in prosperity in the kingdom, owing its wealth largely to its well-watered pastures, which bred sheep whose wool was famous all over England, and to its good supply of water power. Salt is mentioned as a product of the county in Domesday Book. Various small industries grew up, such as plush-making at Banbury, leather works at Bampton and Banbury, gloves at Woodstock, and malt at Henley. Glass was made at Benson and Stokenchurch in the reign of Henry VI., and the wool trade continued, though not in so flourishing a state, Witney retaining its fame in blanket-making. The pestilence of 1349, the conversion of arable into pasture land, and the enclosure of common land in the early 16th century had led to agricultural depression and discontent. In 1580 the enclosure of Otmoor led to serious riots, in which the people gathered in Oxford at St Giles' fair joined. The county was represented in parliament in 1289 by two members.

Antiquities.—The remains of castles are scanty. The majority of them were probably built for defence in the civil strife of Stephen's reign (1100-1153), and were not maintained after order was restored. Considerable portions of the Norman Oxford Castle survive, however, while there are slighter remains of the castle at Bampton, the seat of Aylmer de Valence in 1315. Among remains of former mansions there may be noted the 14th century Greys Court near Henley-on-Thames, Miister Lovell, on the Windrush above Witney, and Ryote, between Thame and Oxford. Miister Lovell, the extensive ruins of which make an exquisite picture by the river-side, was the seat of Francis, Lord Lovel, who, being the son of a Lancastrian father, incurred the hatred of that party by serving Richard III., and afterwards assisted the cause of Lambert Simnel, mysteriously disappearing after the battle of Stoke. The remains of Ryote (partly incorporated with a farmhouse) are of fine Elizabethan brick, and in the chapel attached to the manor there is remarkable Jacobean woodwork, the entire fittings of the church, including the canopied pews and altar-table, being of this period. Here Elizabeth was kept in 1554, before her accession, and afterwards resided as queen. Of ancient mansions still inhabited, the finest is Broughton Castle near Banbury, dating from 1301. Others are Shirburn Castle, begun in 1377, but mainly Perpendicular of the next century; Stanton Harcourt, dating from 1450, with a gateway of 1540; a vast tower of brick and Pope's Tower, named from the poet, who stayed here more than once. Mapledurham, on the Thames above Reading, is a fine Tudor mansion of brick; and Water Eaton, on the Cherwell above Oxford, is a singularly perfect Jacobean house of stone, with a chapel of the same period resembling pure Perpendicular. Of other mansions in the county Blenheim Palace, near Woodstock, must be mentioned. The former Holton House (now replaced by a Georgian building), near Wheatley, was the scene in 1646 of the wedding of Ireton, the soldier of Cromwell, with his leader's daughter Bridget.

The influence of such a centre of learning as the university was naturally very great upon the ecclesiastical history of the neighbourhood. A large number of monastic foundations arose, such as those of Augustinian canons at Bicester, Caversham, Cold Norton, Dorchester, Osney (a magnificent foundation just outside the walls of Oxford) and Wraxton; of Cistercians,
Oxide—Oximes

at Bruern and Thame; of Benedictines, at Cogges, Eyesham, Milton; of Mathurins, at Nuffield; of Gilbertines, at Clattercote; of Templars, at Sandford-on-Thames. There were four
Gosford only of the two preceptors of female Templars in England. Of all these, excepting the abbey church at Dorchester, remains are scanty. A few domestic buildings remain at Studley; the boundary walls still stand of Godstow Nunnery on the Thames, the retreat and burial-place of Rosamund Clifford or “Fair Rosamund,” the object of Henry II’s famous courtship; and there are traces of Rewley Abbey within Oxford.

In ecclesiastical architecture Oxfordshire, apart from Oxford itself, is remarkably rich, but there is no dominant style, nearly all the churches being of mixed dates. In fact, of the most important churches in the county, all but one are Saxon, and only at Oxford are there any buildings of the early English period which may be called as types of a single style. If they, picturesquely placed above the Thames t. m. of Oxford, is one of the finest examples of pure Norman in England, with a harnoise west front. Adderbury, 4 miles southward from Banbury, has a central tower and spire, and a massive central tower and spire. Minster Lovell, also cruciform, is pure Perpendicular; its central tower is supported, with useful and unusual effect, on four detached piers. For the rest, one feature common to Oxford and its antecedents is to be noticed. The turrent ungainly spire of Oxford cathedral was among the earliest, if not the first, constructed in England, and served as a model from which we were probably developed the splendid central spires of the great churches at Wells, Exeter, and Salisbury. Founded in the 13th century, there are also three fine spires in the north: Bloxham, Adderbury and King’s Sutton (across the border in Northamptonshire), which are locally proverbial as typifying length, strength and beauty. Bloxham, in fact, was the site of the court of the bishops of Lincoln. An early English west front, is one of the largest and most beautiful in the county. In the west Burford (Norman and later) is noteworthy, and in the porch of the fine Norman church of Langham is a statue of St. Edmund, which, with the assistance of Edward the Confessor, retains a connection with the Abbey of Westminster, the Dean and Chapter of which are lords of the manor and patrons of the living. In the south-east, Dorchester Abbey, with its nave of transitional Norman, has a curiously Decorated Jesse window, the tracery representing the genealogical tree of the House of Tudor. At Cuddesdon there is another large church, Norman and later. Ewelme church (Perpendicular) is remarkable for the tomb of Alice, Duchess of Suffolk (1475), gorgeous with tracery and gilded canopies, and that of Sir Thomas Champion (1523), in the churchyard. The town of Wantage lies near (Milton and Adderbury are a few miles away). Wantage and Headington, with its new church, is remarkable for the tomb of Sir Thomas More, and the former picture the hospital and free school still standing.

Oxide, in chemistry, a binary compound of oxygen and other elements. In general, oxides are the most important compounds with which the chemist has to deal, a study of their composition and properties permitting a valuable comparative investigation of the elements. It is possible to bring about the direct combination of oxygen with most of the elements (the presence of traces of water vapour is generally necessary according to the researches of H. B. Baker), and when this is not so, indirect methods are available, except with bromine and fluorine (and also with the so-called inert gases—argon, helium, &c.), which so far have yielded no oxides. Most of the elements combine with oxygen in several proportions, for example nitrogen has five oxides: N₂O, NO, NO₂, N₂O₃, N₂O₅; for classificatory purposes, however, it is advantageous to assign a typical oxide to each element, which, in general, is the highest having a basic or acid character. Thus in Group I. of the periodic system, the typical oxide is MO₃, of Group II. MO₂, of Group III. MO₂, of Group IV. MO₃ of Group V. MO₄, of Group VI. MO₃; the oxides may be grouped as follows: (1) basic oxides, (2) acidic oxides, (3) neutral oxides, (4) peroxides, (5) mixed anhydrides and salts. Basic oxides combine with acids or acidic oxides to form salts; similarly acidic oxides combine with basic oxides to form salts also. The former are more usually yielded by the metals (some metals, however, form oxides belonging to other groups), whilst the latter are usually associated with the non-metals. An oxide may be both acidic and basic, i.e. combine with bases as well as acids; this is the case with elements occurring at the transition between basic and oxygenic elements in the periodic classification, e.g. aluminium and zinc. Neutral oxides combine neither with acids nor bases to give salts nor with water to give a base or acid. A typical member is nitric oxide; carbon monoxide and nitrogen dioxide may also be put in this class, but it may be pointed out that these oxides may be regarded, in some measure at least, as the anhydrides of formic and hyponitrous acid, although, at the same time, it is impossible to obtain these acids by simple hydration of the oxides. Peroxides are peculiar substances containing more oxygen than the typical oxide. The failure of this definition is seen in the case of lead dioxide, which is certainly a peroxide in properties, but is also the typical oxide of Group IV. to which lead belongs. All peroxides have oxidizing properties. Peroxides may be chemically regarded as oxide oxides, peroxide oxides, other yields oxygen (these also liberate chlorine from hydrochloric acid), and may combine with lower acidic oxides to form salts of the normal basic oxide with the highest acidic oxide (e.g. PbO₂ + S:O₃ = PbSO₄, PbO₂ + 2H:SO₄ = 2H₂O + SOₓ₄, MnO₂ + Cl₂ = MnCl₂ + 2H:O + Cl₂; PbO₂ + SO₃ = PbSO₄ (i.e. PbO₂ + SO₃). Two species of basic peroxides may be distinguished: (1) the superoxides or peroxides, containing the oxygen atoms in a chain, e.g. Na₂O₂-0-Na₂O₂-0-Br₃O, which yield hydrogen peroxide with acids; and (2) the polyoxides, having the oxygen atoms doubly linked to the metallic atom, e.g. O₂·Mn:O₂·Pb:O₂, and giving oxygen with sulphuric acid, and chlorine with hydrochloric acid. L. Mariano (Zeit. anorg. Chem., 1907, 56, p. 233) pointed out that manganese and iron oxides are typical peroxides, the iron oxide giving dithionate and the latter sulphate, and suggested the following formulae: O₂·Mn:O₂·Pb:O₂, which explains this difference. A simpler explanation is that the manganese dioxide first gives a normal sulphite which rearranges to dithionate, thus: MnO₂ + 2SO₂= = (MnSO₃)₂→MnSO₄, whilst the lead dioxide gives a basic sulphite which rearranges to sulphate, thus: PbO₂ + 3SO₂=PbSO₄→3PbSO₄. Acidic peroxides are formed from oxides containing oxygen; the loss by oxygen yield the acidic oxide typical of the element. Mixed anhydrides are oxides, which yield with water two acids, or are salts composed of a basic and acidic oxide of the same metal. Examples are the oxides of carbon, for which one formula is CO₂H₂O, CO₂H₂O₂, chlorous and chloric acid, and nitrous and nitric acid: 2CO₂H₂O₂ = HClO₂ + HClO₃, 2NO₂ + H₂O = HNO₂ + HNO₃; and of mixed salts Pb₃O₄ and Pb₂O₃, which may be regarded as lead meta- and ortho-plumbite: Pb₂O₃·PbO·PbO₂·Pb₂O₃.

Oxidation and Reduction.—In the narrow sense “oxidation” may be regarded as the combination of a substance with oxygen, and conversely, “reduction” as the abstraction of oxygen; in the wide sense the oxidation includes not merely the addition of oxygen, but also of other electro-negative elements or groups, or the removal of hydrogen or an electro-positive element or group. In inorganic chemistry oxidation is associated in many cases with an increase in the valency, e.g. when carbon is first introduced into iron, it has merely brought about by heat or some other form of energy, we may regard an oxidizing agent as a substance having a strong affinity for electro-positive atoms or groups, and a reducing agent as having a strong affinity for electro-negative atoms or groups; in the actual process the oxidizing agent suffers reduction and the reducing agent oxidation.

Many substances undergo simultaneous oxidation and reduction when treated in a particular manner; this is known as self- or auto-oxidation. For example, on boiling an aqueous solution of a hypochlorite, a chloride and a chloride results, part of the original salt being oxidized and part reduced: 2NaOCl = NaClO₃ + 2NaCl. Similarly phosphorous and hypophosphorous acids give phosphoric acid: 2P₃H₃O = P₃H₉O₃ + 2H₂O, and stannous and stannic acids give the aluminous acid: 3H₂SO₂ = H₂SO₄ + 2H₂O, and hydroxides such as those of iodide, sulphur, phosphorus, &c., carbon, many metals, potassium, soda, aluminium, magnesium, &c., salts of lower oxoacids, lower salts of metals and lower oxides.

Oximes, in organic chemistry, compounds containing the grouping C = N · OH, derived from aldehydes and ketones by condensing them with hydroxylamine. Those derived from aldehydes are known as aldoximes, those from ketones as ketoximes. They were first prepared by V. Meyer in 1882 (Ber., 1882, 15, pp. 1324, 1325, 2775). They are either colourless liquids, which boil without decomposition, or crystalline solids; and are both basic and acidic in character. On reduction by sodium amalgam in glacial acetic acid solution they yield primary amines. They are hydrolysed by dilute mineral acids.
yielding hydroxylamine and the parent aldehyde or ketone. The aldoloximes are converted by the action of dehydrating agents into nitriles: RCH ONOH RC N H2O. The ketoximes by the action of acetyl chloride undergo acetylation yields tetramethyl oxime. A molecular re-arrangement known as the Beckmann transformation, (Ber., 1887, 20, p. 2580), yielding as final products an acid-amide or anilide, thus:

\[
RC\{N=OH\}R' \rightarrow RC\{OH\}\{NR'\} \rightarrow RCONHR'.
\]

As regards the constitution of the oximes, two possibilities exist, namely: C > NOH, or > O NH and the first of these is presumably correct, since on alkylation and subsequent hydrolysis an alky hydroxylamine of the type NH2OR is obtained, and consequently it is to be presumed that in the alkyoxime, the alkyl group is attached to the nitrogen atom of one of the two carbon atoms which are connected by the hydroxyl group. It is to be noted that the oximes of aromatic aldehydes and of unsymmetrical aromatic ketones frequently exist in isomeric forms. This isomerism is explained by the Hantzsch-Werner hypothesis (Ber., 1890, 23, p. 11) in which the isomerism is made that the three valencies of the nitrogen atom do not lie in the same plane. Thus in the case of the simple aldoloximes two configurations are possible, namely:

\[
R-C-H \quad \text{and} \quad R-C-H
\]

where the H atom and OH group are contiguous, being known as syn-aldoloximes and the latter as the anti-aldoloximes. The syn-aldoloxime is of acetyl solubility yields tetramethyl oxime; the anti-aldoloxime as a rule are acetylated and do not yield nitriles. The isomerism of the oximes of unsymmetrical ketones is explained in the same manner, and their configuration is determined by an application of the Beckmann transformation (see Ber., 1891, 24, p. 3) thus:

\[
R-C-R' \rightarrow R\{OH\}R' \rightarrow RCONHR\{R' \text{and OH, "syn"}\}.
\]

**Formaldoxime**, CH3 ONOH, was obtained by W. R. Dunstan (Jour. Chem. Soc., 1898, 73, p. 352) as a colourless liquid by the addition of hydroxylamine hydrochloride to an aqueous solution of formaldehyde, followed by the addition of hydrochloric acid. The resulting solution was extracted with ether and the oxime hydrochloride precipitated by gaseous hydrochloric acid, the precipitate being then dissolved in water, the solution exactly neutralized and distilled. It boils at 83-84° C and burns with a green coloured flame. It is readily transformed into a solid polymer, probably (CH2 ONOH). In the absence of water, it forms salts of the type (CH2 ONOH) nHCl with acids. It behaves as a powerful reducing agent, and on hydrolysis with dilute mineral acids is decomposed into formaldehyde and hydroxylamine. The latter compound is soluble in water in the form of its acetate, CH3 CO OH ONOH, and the two compounds are derivatives of the threefold polymeric form. The acetyl compound on reduction yields two of its nitrogen atoms in the form of ammonia and the third in the form of methylene.

**Acetophenoxime**, CH3 ONOCH2C6H4CH3, is obtained by nitriles which melt at 47° C. On continued fusion the melting point gradually sinks to about 13° C, probably owing to conversion into a polymeric form. **Chloraloxime**, CCl3 CH ONOH, is obtained when one molecular proportion of chloral hydrate is warmed with four molecular proportions of hydroxylamine hydrochloride and a little acid. It crystallizes in prisms which melt at 39° C. A chloral hydroxylamine, CCl3 CH ONOH, melting at 98° C is obtained by allowing a mixture of one molecular proportion of chloral hydrate with two molecular proportions of hydroxylamine hydrochloride and one of sodium carbonate to stand for some time in a desiccator. **Glyoxime**, HON CH CH ONOH, obtained from glyoxal and hydroxylamine, or by boiling amidothiazole with excess of hydroxylamine on cold and water, melts at 178° C and is readily soluble in hot water.

*Succinic aldehyde dioxime*, HON CH2 CH2 CH2 CH2 ONOH, is obtained by boiling an alcoholic solution of pyrul with hydroxylamine hydrochloride and anhydrous sodium carbonate (G. Ciamian, Ber., 1884, 17, p. 534). It melts at 173° C; and on reduction with sodium amalgam and ammonium silver nitrate loses hydroxamic acid and is transformed into an acetyl pentose. The pentose is then obtained from the acetyl compound by successive treatment with ammonia and dilute acids:

\[
\text{CH}_3\text{CH}_2\text{CH}_2\text{ONOH} \rightarrow \text{CH}_3\text{CH}_2\text{CH}_2\text{ONOOH} \rightarrow \text{CH}_3\text{CH}_2\text{CH}_2\text{NO} \rightarrow \text{CH}_3\text{CH}_2\text{CH}_2\text{NH} \rightarrow \text{CH}_3\text{CH}_2\text{CH}_2\text{CN} \rightarrow \text{CH}_3\text{CH}_2\text{CH}_2\text{CONHCH}_2\text{CN} \rightarrow \text{CH}_3\text{CH}_2\text{CH}_2\text{CONHCH}_2\text{CN} \rightarrow \text{CH}_3\text{CH}_2\text{CH}_2\text{COH} \rightarrow \text{CH}_3\text{CH}_2\text{CH}_2\text{COOH}.
\]

An ingenious application of the fact that oximes deposited by the elements of water and form nitriles was used by A. Wolff (Ber., 1893, 26, p. 730) in the "breaking down" of the sugars. Glucose oxime on warming with acetic anhydride is simultaneously acetylated and dehydrated, yielding an acetylated glucosetol, which when heated with ammoniacal silver nitrate loses hydroxamic acid and is transformed into an acetyl pentose. The pentose is then obtained from the acetylated compound by successive treatment with ammonia and dilute acids:

\[
\text{CH}_3\text{OH}\{\text{CHOH}\}\{\text{CHOH}\}\{\text{CHOH}\}\{\text{CHOH}\} \rightarrow \text{CH}_3\text{OH}\{\text{CHOH}\}\{\text{CHOH}\}\{\text{CHOH}\} \rightarrow \text{CH}_3\text{OH}\{\text{CHOH}\}\{\text{CHOH}\} \rightarrow \text{CH}_3\text{OH}\{\text{CHOH}\} \rightarrow \text{CH}_3\text{OH}.
\]

In order to arrive at the configuration of the stereoisomeric ketoximes, A. Hantzsch (Ber., 1891, 24, p. 13) has made use of the Beckmann reaction, whereby they are converted into acid-amides. Thus, with the tolylphenylketoximes, one yields the anilide of the other the toluidine of benzoic acid, the former necessitating the presence of the phenyl and hydroxyl radicals in the syn position and the latter the toly and hydroxyl radicals in the anti position, thus:

\[
\begin{align*}
\text{CH}_3\text{CH}_2\text{C} & \rightarrow \text{CH}_3\text{CH}_2\text{CONHCH}_2\text{H}, \\
\text{N-OH} & \rightarrow \text{N-Syn-phenyltolylketoxime}, \\
\text{CH}_3\text{CH}_2\text{C} & \rightarrow \text{CH}_3\text{CH}_2\text{OHCOCH}_3, \\
\text{HO-NO} & \rightarrow \text{Antitolyphenylketoxime}.
\end{align*}
\]

In the case of the aldoloximes, one which most readily loses the elements of water on dehydration is assumed to contain its hydroxyl radical adjacent to the movable hydrogen atom and is designated the syn-compound.

OXUS, or AMU DARYA, one of the great rivers of Central Asia. Prior to the meeting of the commissions appointed for the determination of the Russo-Afghan boundary in 1885, no very accurate geographical knowledge of the upper Oxus regions existed, and the course of the river itself was but roughly mapped. Russian explorers and natives of India trained for geographical reconnaissance, and employed in connexion with the great trigonometrical survey of India, had done so much towards clearing away the mists which enveloped the actual course of the river, that all the primary affluents were known, although their relative value was misunderstood, but the nature of the districts which bordered the river in Afghan Turkestan was so imperfectly mapped as to give rise to considerable political complication in framing the boundary agreement between Great Britain and Russia. From Lake Victoria (Sor-Kul) in the Pamirs, which was originally reckoned as the true source of the river, to Khamiab, on the edge of the Andkhui district of Afghan Turkestan, for a distance of about 680 m., the Oxus forms the boundary between Afghanistan and Russia. For another 550 m. below Khamiab it follows an open and sluggish course till it is lost in the Sea of Aral, being spanned at Charjui, 150 m. below Khamiab, by the wooden bridge which carries the Russian railway from Merv to Samarkand. The Oxus is about 1,340 m. above sea level. At Khamiab the river is probably rather less than 300 ft.

For many years a lively geographical controversy circled about the sources of the Oxus, and the discussion derived some political significance from the fact that the true source, wherever it might be, was claimed as a point in the Russo-Afghan boundary. The final survey of the Pamir region (wherein the heads of all the chief tributaries of the river lay hidden), by the Pamir boundary commission of 1895 established the following topographical facts in connexion with this question. The elevated mountain chain which is now called the Nicolas range, which divides the Great from the Little Pamir, is a region of vast glaciers and snow-fields, from which the lakes lying immediately north and south derive the greater part of their water-supply. On the north the principal glacial tributary of Lake Victoria forms, within the folds of the gigantic spurs of the Nicolas mountains, a series of smaller lakes, or lakelets, before joining the great lake itself. On the south a similar stream starting farther eastward enters the Oxus, and forming the point of the dangerous pass across the range) sweeps downwards towards Lake Chadmakhtin, the lake of the Little Pamir, which is some 400 ft. lower than Victoria. But at the foot of the mountain this stream bifurcates in the swamps which lie to the west of Chadmakhtin, and part of its waters find their way eastwards into the lake, and part flow away westwards into the Ab-i-Panja, which joins the Pamir river from Lake Victoria at Kala Panja. This at any rate is the action of the Burghutai stream during certain seasons of the year, so that the glaciers and snow-fields of the Nicolas range may be regarded as the chief fountain-head of at least two of the upper tributaries of the Oxus, namely, the Aksu (or Murghab) and the Pamir river, and as contributing largely to a third, the Ab-i-Panja. Neither Lake Victoria nor Lake Chadmakhtin derives any very large contributions from glacial sources other than those of the Nicolas range. It is possible that there may be warm springs on the bed of Lake Victoria, as such springs are of frequent occurrence in the Pamirs; but there is no indication of them in the Chadmakhtin basin, and the latter lake must be regarded neither as an incident in the course of the Aksu—a widening of the river channel in the midst of this high-level, glacier-formed valley—than as the fountain-head of the infant stream. There are indications that the bed of Lake Victoria, as well as that of Chadmakhtin, is rapidly silting, and that the shores of the latter are gradually receding farther from the foot of the hills. The glacial origin of the Pamir valleys is everywhere apparent in their terrace formations and the erratic blocks and boulders that lie scattered about their surface. It is probable that the lakes themselves are evidence of (geologically) a comparatively recent deliverance from the thraldom of the ice coving, which has worn and rounded the lower ridges into the smooth outlines of undulating downs.

Another important source of the river (considered by Curzon to be the chief source) is to be found in the enormous glaciers which lie about the main or upper branch of the Ab-i-Panja (called the Ab-i-Wakhjir or Wakhja river), which drains the mountains enclosing the head of the Taghbundash Pamirs. Although the superficial area of glacial ice from which the Ab-i-Wakhjir derives the greater part of its volume is not equal to that found on the Nicolas range, it is quite impossible to frame any estimate of comparative depth or bulk, or to separate the volume of its contributions at any time from those which, combined, derive their origin from the Nicolas range. If the Aksu (or Murghab) and the Pamir river from Lake Victoria are to be considered in the light of independent tributaries, it is probable that the Ab-i-Panja contributes as large a volume of glacial flood to the Oxus as either of them.

From the point where the rivers of the Great and Little Pamirs join their forces at Kala Panja to Ishkashim, at the elbow of the great part of the Oxus, a space which has been surveyed by Woodthorpe; and the northern slopes of the Hindu Kush, which near Ishkashim extend in slopes of barely 10 m. in length from the main watershed to the river banks, have been surveyed by the author in the summer of 1884, and the extent of the Oxus territory which exists north of the Hindu Kush between Kala Panja and Ishkashim. From Ishkashim northwards the river passes through the narrow rock-bound valleys of Shignan and Bokhara, for a distance of 100 miles or more, before it can join the left bank of the river. All this part of the Oxus, until the river once again emerges from the Bokhara hills into the open plains bordering Badakshan on the north, falls within the area of Russian surveys, with which information from India has been effected both on the Pamirs and in Turkestan.

At Langar Kishit, a little to the east of the Oxus bend, there is a small Russian post of observation. About 50 m. north of the bend, where the Suchan or Ghund joins the Oxus from the Aksu, the river forms a bend which is called Charog. On the left bank of the river the Afghans maintain a frontier post at the fort of Kala Bar Panja. A road will connect Charog with the Alichir Pamir, following the general course of the Oxus stream, a road which will form an even more valuable link in the chain of communications between Bokhara and Sarikol. Eighty-five miles north of Ishkashim, at Kala Panja, the river which rises in the Little Pamir, and which is called Aksu, Murghab, or Pamirski, falls into the Oxus river, which is also the Russian outpost, Murghabi (or Panirski), is situated, at an elevation of 1,215 ft. above the sea. Fort Murghabi is connected by a good military road with Osh. At this point the measurements of the compass lengths of the chief Pamir tributaries of the Oxus is as follows:

<table>

For 120 m. the two latter are united in the main stream of the Oxus, all the rest of it being derived from the Ghund and Shahkhdara draining the Alichir Pamir and the heights of Shignan.

The narrow cramped valley of the river between Ishkashim and Kala Panja is bounded on the west by a ridge flanking the highlands of Badakshan; on the east the buttresses and spurs of the Shignan mountains (of which the strike is transverse to the direction of the river and more or less in a line to the south) overhang their channel like a wall, and afford but little room either for cultivation or for the maintenance of a practicable road. Yet the lower elevation (for this part of the Oxus stream is not more than about 7,000 ft. above sea-level) and comparatively mild climate give opportunities to the industrious Tajik population for successful agricultural, of which they are not slow to avail themselves, and a track exists on the left bank of the river to Kala Bar Panja, which is practicable for mules. There are no bridges, and the transit of the river from bank to bank can only be effected by the use of inflated skins. Beyond the Bartang (or Murghab) confluence the valley narrows, and the difficulties of the river route increase. Between Badakhshan to Ishkashim (or above Charog) 4,400 ft., where the Oxus again bends southwards, its course to the north-west is almost at right angles to the general strike of the Darwaz mountains, which is from north-east to south-west, following the usual conformation of those ranges. It is crossed, after that, by the Great and Little Wanj valleys, the Oxus again running north-westwards. The Wanj and the Yez Ghulum drain valleys which are comparatively open, and which are said to be splendidly fertile. At
Kala Khum the river is 480 ft. wide, narrowing to 350 ft. in the narrowest gorge. Its level varies with the obstructons formed by ice, falling as much as 28 ft. when its upper channels are blocked.

The climate of eastern Bohkara and Darwaz is delightful in summer, and Dr. Regel writes of its Alpine scenery and flora in terms of enthusiastic admiration. In the valleys of the Wakhs and the Surkhab to the north of Darwaz, which form an important part of the basin of the Oxus, the equable climate of summer and the coolness of winter, hawthorn, pistachio, and juniper grow freely in the mountain forests, and beetroot, kohl rabi, and other vegetables are widely cultivated. About the cliffs and precipices of the Panja valley near Kala Khum the wild vine, cerasus, and pomegranate may be found, and the plane tree and mulberry flourish in groups near the villages. Here also, amongst other plants, the sunflower decorates village gardens.

The houses are built of stone and mortar, and covered with straw. The stucco and stone-clad buildings of the wider valleys are sometimes of two-storied buildings the square water-tower rises gracefully. Every house possesses its staircase, its well, and cisterns for irrigation; and on the whole the Aryan Tajiks of this northern section of the Oxus valley seem to be well provided with most of the luxuries of life. Their language is the language of Bohkara and Samarkand. Bohkiran supremacy was re-established in 1780, when Kala Khum was occupied by Bohkiran troops. Since then the right bank of the river has been politically divided from the left, and the latter now belongs to Afghanistan. From Kala Khum, which fort about marks the most northerly point of the great bend of the Oxus round Badakshan, the river follows round the west side of the narrow mountainous region where it widens into the open valley south of Kolab. It now becomes a river of the plains from which the mountains on either side stand back.

The topographic position of the river is not accurately known, but at least one considerable stream of some 60 m. in length drains to the north-east, parallel to the general strike of the mountain system in the transverse course of the river, and joins it near its mouth; another stream joins it near Yazghul and Wulam. This stream is called Pangli-Shiwa, or Shiva, but not much is known about it. Another about equal length, starting from the same central water-parting of this mountain block, and including with it a mass of smaller streams, drains to the north-east towards Shahdo and the Shiwa, and joins the Oxus valley near its debouchment into the more open Kolab plains, where the course of the Oxus has again assumed a direction parallel to the mountain strike of the main mass of the Karategin range which is called the Ragh or Sadda) is that towards its junction with the Oxus it cuts through successive mountain ridges, which renders its course impracticable as a roadway. It is necessary to avoid the river, and so by mountain tracks which surmount a series of passes.

Kara- ghan Affluents. The Kara-ghan, which is formed by the Kesh and the Kiz, was described in the passage of the Karategin. The Kesh flows from the north-east in a south-westerly direction, and is one of the principal streams of the Karategin. The Kiz is a small stream which issues from the mountain chain of the north-west of the Karategin and flows in a north-westerly direction. It joins the Kesh and becomes the Kara-ghan near the Blue City.

Darwas Affluents. Darwas, or the Darwaz, is the chief affluence of the Oxus and flows from the south-west to the north-east, cutting through the mountainous region and entering the Oxus behind the city of Surkhak.

Kwaja Salan. The Kwaja Salan is the last important affluence to be noted. It rises in the Byanto Range near the mouth of the Oxus and flows in an east-southeast direction. Its course is marked by a series of small hills and valleys, and it ultimately joins the Oxus at the town of Badakshan, where it is known as the Ziarat River.

desert. Under Russian auspices a considerable strip of alluvial soil on the left bank has been brought under cultivation, measuring 4 or 5 m. in width, and there is more cultivation on the banks now than in the Merv oasis itself, but it is confined to the immediate neighbourhood of the river, for no affluents of any considerable size exist. The river is navigable below Charji, and takes its place as an important unit in the general scheme of Russian frontier communications. There is a steamer service on the river for a spell in summer and once a week in winter, as far as Pata Kasar. The steamers are flat-bottomed paddle boats drawing 3 ft.

An important feature in connexion with the course of the Oxus is the discussion that has arisen with regard to its former debouchment into the Caspian Sea. On this point much recent evidence has been collected, and it appears certain that there was a time in the post-Pleistocene Age when a long gulf of the Caspian Sea protruded eastwards nearly as far as the latitude of Merv, covering the Kara Kum sands, but now the Kara Kum plateau to the north of the sands, which is separated from the sands by a distinct sea beach. At the same time another branch of the same gulf protruded northwards in the direction of the Aral, probably as far as the Sayram depression, which lies to the west of the Khivan delta of the Oxus, separated from it by wide beds of loess, clays and gravel, covering rocks of an unknown age. The Murghab river and the Har Rud, which terminate in the cases of the Aral and Sarakhs, have certainly penetrated to the gulf of the Kara Kum, but the question whether the Oxus was ever deflected so as to enter the gulf with the Murghab cannot be said to be answered decisively at present. The former connexion between the Caspian and the Aral is substantiated by the importance of the delta of the Oxus; the depression seems to be admitted by Russian scientists, nor would there appear to be much doubt about the connexion between the Khivan oasis and the northern extremity of the Sayram depression. In this connexion it is of great importance to note that the Aral depression of Annaas Khan and other Russian geographers are conspicuous. The general conclusions are ably summed up by P. Kropotkin in the September number of the Journal of the Royal Geographical Society for 1898.

History.—In the most remote ages to which written history carries us, the regions on both sides of the Oxus were subject to the Persian monarchy. Of their populations Herodotus mentions the Bactrians, Chorasmians, Sogdians and Sacae as contributing their contingents to the armies of the great king Darius. The Oxus figures in Persian romantic history as the limit between Iran and Turan, but the substratum of settled population to the north as well as the south was probably of Iranian lineage. The valley is connected with many early Magian traditions, according to which Zoroaster dwelt at Balkh, where, in the 7th century B.C., his proselytizing efforts first came into operation. Buddhism eventually spread widely over the Oxus countries, and almost entirely displaced the religion of Zoroaster in its very cradle. The Chinese traveller Huen Tsang, who passed through the country in A.D. 630-644, found Termez, Khulm, Balkh, and above all Bamiyan, amply provided with monasteries, stupas and colossal images, which are the striking characteristics of prevalent Buddhism; even the Pamir highlands had their monasteries. Christianity penetrated to Khorasan and Bactria at an early date; episcopal sees are said to have existed at Merv and Samarkand in the 4th and 5th centuries, and Cosmas (+545) testifies to the spread of Christianity among the Bactrians and Hunus.

Bactria was long a province of the empire which Alexander the Great left to his successors, but the Greek historians give very little information of the Oxus basin and its inhabitants. About 250 B.C. Diodotus, the “governor of the thousand cities of Bactria,” declared himself king, simultaneously with the revolt of Arsaces which laid the foundation of the Parthian monarchy. The Graeco-Bactrian dominion was overwhelmed entirely about 126 B.C. by the Yue-chi (p.v.), a numerous people who had been driven westwards from their settlements on the borders of China by the Hsiung nu (p.v.). From the Yue-chi arose, about the Christian era, the great Indo-Scythian dominion which extended across the Hindu Kush southwards, over Afghanistan and Sind. The history of the next five centuries is a blank. In 571 the Haiathalah (Epiphantes, q.v.) of the Oxus, who are supposed to be descendants of the Yue-chi, were shattered by an invasion of the Turkish khanan; and in the following century the Chinese pilgrim Huen Tsang found the former empire of the Haiathalah broken up into a great number of small states, all acknowledging the supremacy of the Turkish khanan, and several having names identical with those which still exist. The whole group of states he calls Tukhara, by which name in the form of Tokharistan, by that of Haiathalah, the country continued for centuries to be known to the Mahomedans. At the time of his pilgrimage Chinese influence had passed into Tokharistan and Transoxiana. Yazged, the last of the Sassanid kings of Persia, who died in 651, when defeated and hard pressed by the Moslems, invoked the aid of China; the Chinese emperor, Taitsung, issued an edict organizing the whole country from Fergana to the borders of Persia into three Chinese administrative districts, with 126 military cantonments, an organization which, however, probably only existed on paper.

In 711-712 Mahommedan troops were conducted by Koutaiba, the governor of Khorasan, into the province of Khwarizm (Khiva), after subjugating which they advanced on Bokhara and Samarkand, the ancient Sogdiana, and are said to have even reached Fergana and Kashgar, but no occupation then ensued. In 1016-1025 the government of Khwarizm was bestowed by Sultan Mahmud of Ghazni upon Altunshah, one of his most distinguished generals.

Tokharistan in general formed a part successively of the empires of the Sassanid dynasty (terminated A.D. 999), of the Ghaznevid dynasty, of the Seljuk princes of Persia and of Khorasan, of the Ghori or Shansabanya kings, and of the sultans of Khwarizm. The last dynasty ended with Sultan Jalal-ud-din, during whose reign (1221-1231) a division of the Mogul army of Jenghiz Khan first invaded Khwarizm, while the khan himself was besieging Bamiyan; Jalal-ud-din, deserted by most of his troops, retired to Ghazni, where he was pursued by Jenghiz Khan, and again retreating towards Hindustan was overtaken and driven across the Indus.

The commencement of the 16th century was marked by the rise of the Uzbek rule in Turkestan. The Uzbegs were no one race, but an aggregation of fragments from Turks, Mongols and all the great tribes constituting the hosts of Jenghiz and Batu. They held Kundus, Balkh, Khwarizm and Khorasan, and for a time Badakshan also; but Badakshan was soon won by the emperor Baber, and in 1529 was bestowed on his cousin Suleimtan, who by 1555 had established his rule over much of the region between the Oxus and the Hindu Kush. The Mogul emperors of India occasionally interfered in these provinces, notably Shah Jahan in 1646; but, finding the difficulty of maintaining so distant a frontier, they abandoned it to the Uzbeg princes. About 1765 the wazir of Ahmad Shah Abdali of Kabul invaded Badakshan, and from that time until now the domination of the countries on the south bank of the Oxus from Wakhân to Balkh has been a matter of frequent struggles between Afghans and Uzbegs.

The Uzbeg rule in Turkestan has during the last fifty years been rapidly dwindling before the growth of Russian power. In 1803 Russia invaded the Khokand territory, taking in rapid succession the cities of Turkestan, Chimkent and Tashkend. In 1868 Khojend was taken, the power of Khokand was completely crushed, a portion was incorporated in the new Russian province of Turkestan, while the remainder was left to be administered by a native chief almost as a Russian feudatory; the same year the Bokharines were defeated at Irdjar. In 1867 an army assembled by the amir of Bokhara was attacked and dispersed by the Russians, who in 1868 entered Samarkand, and became virtually rulers of Bokhara. In 1873 Khiva was invaded, and as much of the khanate as lay on the right bank of the Oxus was incorporated into the Russian empire, a portion being afterwards made over to Bokhara. Russia acquired the right of free navigation of the Oxus throughout its entire course, on the borders of both Khiva and Bokhara. The administration of the whole of the states on the right bank of the Oxus, down to the Russian boundary line at Ichka Yar, is now in the hands of Bokhara, including Karateghin—which the Russians have transferred to it from Khokand—and Darwaz at the entrance to the Pamir highlands.
OXYGEN

Authorities.—Although much has been written of late years about the sources of the Oxus within the region of the Pamirs, there is very little to be found in the writings of geographers of modern date descriptive of that part of its course which separates Darvaz and Afghan Turkestan from Bokhara, and that of the Mazaw and its affluents, &c., which are not available to the public. The following authorities may be consulted: The Report of the Pamir Boundary Commission of 1895, published at Calcutta (1897); Dr. A. Bagley, "Journey in Karatchas and Darvas," vol. i. (1884); D. de Mecquenem, "Report on the Red Sea," Int. Geog. Soc., vol. xii. (1882); translation, vol. iv. Proc. R.G.S.; Michelin, "Regions of the Upper Oxus," vol. vii. Proc. R.G.S. (1884); Griesbach, "Geological Notes," No. 3, Afghan Boundary Commission (1885); C. Yarborough, "Afghanistan," London (1895); and that of Lochart's Mission in 1885, and the Indian Survey Reps. (T. H. H.).

OXGEN (symbol O, atomic weight 16), a non-metallic chemical element. It was apparently first obtained in 1774 by Stephen Hales by strongly heating mint, but he does not seem to have recognized that he had obtained a new element, and the first published description of its properties was due to J. Priestley in 1774, who obtained the gas by igniting mercuric oxide, and gave it the name "dephlogisticated air." K. W. Scheele, working independently, also announced in 1775 the discovery of this element which he called "empirical air" (Crells Annalen, 1785, 2, pp. 229, 291). A. L. Lavoisier repeated Priestley's experiments and named the gas "oxygen" (from Gr. ὀξύς, sour, ψ̣όδος, I produce) to denote that in a large number of cases, the products formed by the combustion of substances in the gas were of an acid character. Oxygen occurs naturally as one of the chief constituents of the atmosphere, and in combination with other elements it is found in very large quantities; it constitutes approximately eight-ninths by weight of water and nearly one-half by weight of the rocks composing the earth's crust. It is also disengaged by growing vegetation, plants possessing the power of absorbing carbon dioxide, assimilating the carbon and rejecting the oxygen. Oxygen may be prepared by strongly heating manganese dioxide and many other peroxides; by heating the oxides of precious metals; and by heating many oxy-acids and oxy-compounds to high temperatures, for example, nitric acid, sulphuric acid, nitric, lead nitrate, zinc sulphate, potassium chlorate, &c. Potassium chlorate is generally used and the reaction is accelerated and carried out at a lower temperature by previously mixing the salt with about one-third of its weight of manganese dioxide, which acts as a catalytic agent. The actual decomposition of the chlorate is not settled definitely; the following equations give the results obtained by P. F. Frankland and Dingwall (Chem. News, 1887, 55, p. 67):—

\[ 5\text{KClO}_3 + \text{KCl} + 6\text{O}_2 \]

succeeded by the following reactions as the temperature increases: \[ 2\text{KClO}_3 \rightarrow \text{KClO}_4 + \text{KCl} + \text{O}_2 \]

and \[ 2\text{KClO}_4 + 3\text{KCl} + 8\text{O}_2 \]. (see also F. Teed, ibid., 1887, 55, p. 97; H. N. Warren, ibid., 1888, 58, p. 247; W. H. Sodeau, Proc. Chem. Soc., 1901, 17, p. 149). It may also be obtained by heating manganese dioxide or potassium permanganate with sulphuric acid; by the action of cobalt salts or manganese dioxide on a solution of bleeding powder (Th. Flettmann, Ann., 1865, 134, p. 64); by the action of a ferrous or manganese salt with a salt of cobalt, nickel or copper on bleeding powder (G. F. Jaubert, Ger. pat. 1,757,171); by passing chlorine into milk of lime (C. Winkler, Jour. prakt. Chem., 1866, 180, p. 340); by the action of chlorine on steam at a bright red heat; by the decomposition of hydrogen peroxide by bleaching powder, manganese dioxide, potassium permanganate in alkaline solution, or potassium permanganate in acid solution; by heating barium peroxide with an aqueous solution of potassium permanganate (G. Kassner, Zeit. angew. Chem., 1890, p. 448)

\[ \text{BaO}_2 + 2\text{K}_2\text{Fe(CN)}_6 \rightarrow \text{Ba}[\text{Fe(CN)}_6]_2 + \text{O}_2 \]

by the decomposition of sodium and potassium peroxides with a solution of potassium permanganate in the presence of a trace of nickel salts (G. F. Jaubert, Comptes rendus, 1902, 134, p. 778).

Numerous methods have been devised for the manufacture of the oxygen. The more important are as follows: by decomposing strongly heated sulphuric acid in the presence of a contact substance; by heating an intimate mixture of one part of sodium nitrate with two parts of zinc oxide (T. H. Pepper, Diagler's Jour., 1863, 167, p. 39): \[ 2\text{ZnO} + \text{Na}_2\text{NO}_3 \rightarrow 2\text{Zn(NO}_3)_2 + 2\text{Na} + \text{O}_2 \]; by the use of cuprous chloride which when mixed with clay and sand, moistened with water and heated in a current of air at 100-200° C. yields an oxichloride, which latter yields oxygen when heated to 400° C. (A. Mallet, Comptes rendus, 1867, 64, p. 226; 1868, 66, p. 349); by the electrolysis of solutions of sodium hydroxide, using nickel electrodes; by heating calcium plumbate (obtained from litharge and calcium carbonate) in a current of carbon dioxide (G. Kassner, Monit. Scient., 1890, pp. 593, 614); and from air by the process of Tessé du Motay (Ding Jour., 1870, 196, p. 230), in which air is drawn over a heated mixture of manganese dioxide and sodium hydroxide, the sodium manganate so formed being then heated to about 450° C. in a current of steam, the following reversible reaction taking place: \[ 4\text{NaOH} + 2\text{MnO}_2 \rightarrow 2\text{Na}_2\text{MnO}_4 + 2\text{H}_2\text{O} \]. Oxygen in the amount prepared by Brin's process (Mem. soc. des Ingén. c., 1881, p. 439) in which barium monoxide is heated in a current of air, forming the dioxide, which when the retorts are exhausted yields up oxygen and leaves a residue of monoxide; but this method is now being superseded, its place being taken by the fractional distillation of liquid air (The Times, Engin. Suppl., April 14, 1909, p. 13) as carried out by the Linde method (Eng. Pat. 14111; 1902).

Oxygen is a colourless, odourless and tasteless gas. It is somewhat heavier than air, its specific gravity being 1.0523 (A. Leduc, Comptes rendus, 1896, 123, p. 805). It is slightly soluble in water and more so in alcohol. It also dissolves quite readily in some molten metals, especially silver. Oxygen does not burn, but is the greatest supporter of combustion known, nearly all the other elements combining with it under suitable conditions (cf. Oxide). These reactions, however, do not take place if the substances are absolutely dry. Thus H. B. Baker, Proc. Soc. Chem. Soc., 1903, 18, p. 40) has shown that perfectly dry oxygen and hydrogen will not combine at a temperature of 100° C. It is the only gas capable of supporting respiration. For the properties of liquid oxygen see Liquid Gases.

It is found, more especially in the case of organic compounds, that if a substance which oxidizes readily at ordinary temperature be mixed with another which is not capable of such oxidation, then both are oxidized simultaneously, the amount of oxygen used being shared equally between them; or in some cases when the substance is an oxidizing agent, it is reduced to the oxide, and the peroxide converted into ozone or hydrogen peroxide. This phenomenon was first noticed by C. F. Schönbein (Jour. prakt. Chem., 1855-1868) who found that on oxidizing lead in the presence of sulphuric acid, the oxide and that on the addition of lead oxide as is converted into hydrogen peroxide. In a similar manner M. Traube (Ber., 1882-1893) found that when zinc is oxidized in presence of water equivalent quantities of zinc hydroxide and hydrogen peroxide are formed. Further, \[ \text{Zn} + \text{H}_2\text{O} = \text{Zn(OH)}_2 + \text{H}_2 \]. (Zeit. Chem., 1897, p. 189) calls the substance which undergoes oxidation the "autooxidizer" and the substance which unites with the active oxygen the acceptor; in the oxidation of metals he expresses the reaction \[ \text{M} + \text{O}_2 = \text{M} + \text{O}_2 \] as follows: \[ \text{Zn} + \text{H}_2\text{O} = \text{Zn(OH)}_2 + \text{H}_2 \]. The oxygen unifying with the substance undergoing oxidation is known as "bound oxygen," whilst that which is transformed into ozone or hydrogen peroxide is called the "free oxygen." These processes have been developed in order to account for these phenomena. Schönbein (loc. cit.) assumed that the ordinary oxygen molecule is decomposed into two parts, the one carrying the positive charge being called "autooxidizer" and the other carrying the negative charge being called "ozone," one variety being preferentially used by the oxidizing compound or element and the other variety by another element. See section 928. (Zeit. Chem., 1895, 16, p. 411) is of the opinion that the oxygen molecule is to a certain extent ionized and that the ions of one kind are preferentially used by the oxidizing compound. Traube (loc. cit.), on the other hand, concludes that the oxygen molecule enters into action as a whole and that on the addition of metals, hydrogen peroxide and the oxide of the metal are the primary products of the reaction. A. Bach (Comptes rendus, 1897, 124, p. 2) considers that the first stage in the reaction consists in the production of a peroxide which...
then interacts with water to form hydrogen peroxide (see also W. Manchot, *Ann.*, 1901, 314, p. 177; 1902, 325, p. 95).

Oxygen is a member of the sixth group in the periodic classification, and consequently possesses a maximum valency of six. In many cases it behaves as a divalent base, but it may also be a quadrivalent. A. v. Baeyer and V. Villiger (*Ber.*, 1901, 34, pp. 2679, 3612) showed that many organic compounds (ethers, aldehydes, ketones, &c.) behave towards acids, particularly the more complex, and towards bases, like bases, in forming a salt with which quadrivalent oxygen must be assumed as the basic element. These salts are considered to be derived from the hypothetical base OH₂-Öx, oxonium hydroxide (compare sulphonium salts). Further see J. Schmidt, "Über die basischen Eigenschaften des oxydolischen Wasserstoffes" (*Ber.*, 1901, 34, p. 2679.) Villiger argues for the configuration of the salts of carbonyl compounds the arrangement > C : O < X₁ whist. J. W. Brühl and P. W. Walden point out from the physico-chemical standpoint that in water and hydrogen peroxide the oxygen atom is probably quadrivalent.

The atomic weight of oxygen is now generally taken as 16, and as such is used as the standard by which the atomic weights of the other elements are determined, owing to the fact that many elements combine with oxygen more readily than with hydrogen (see ELEMENT).

Oxygen is widely used in medical practice as well as in surgery. In the last century it was discovered that oxygen is an essential element in the formation of protein, and that oxygen is also used by living cells, and that oxygen is used by living cells.

The mode of administration is by the inhalation of pure oxygen, which is administered in doses of 1 to 2 liters per minute, and which is maintained for about 10 minutes. The mode of administration is by the inhalation of pure oxygen, which is administered in doses of 1 to 2 liters per minute, and which is maintained for about 10 minutes.

The use of this name in the vernacular is equivalent to that of Ostrea (Lat. from Gr. δόντων, oyster, so called from its shell, δόντων, bone, shell in zoological nomenclature; there are no genera so similar to Ostrea as to be confounded with it in ordinary language. Ostrea is a genus of Lamellibranch Mollusca. The degeneration produced by sedentary habits in all lamellibranchs has in the oyster reached its most advanced stage. The valves of the shell are closed by a single large adductor muscle, the anterior adductor being absent. The muscular projection of the ventral surface called the foot, whose various modifications characterize the different classes of Mollusca, is almost entirely aborted. The two valves of the shell are unequal in size, and of different shape; the left valve is larger, thicker and more convex, and on it the animal rests in its natural state. This valve, in the young oyster, is attached to some object on the sea-bottom; in the adult it is sometimes attached, sometimes free. The right valve is flat, and smaller and thinner than the left. In a corresponding manner the right side of the animal's body is somewhat less developed than the left, and to this extent there is a departure from the bilateral symmetry characteristic of Lamellibranchs.

The organization of the oyster, as compared with that of a typical lamellibranch such as Anadon (see Lamellibranchia), is brought about by the reduction of the anterior part of the body accompanying the loss of the anterior adductor, and the enlargement of the posterior region. The pedal ganglia and auditory organs have disappeared with the foot, at all events have never been detected; the cerebral ganglia are very minute, while the parieto-splanchic are well developed, and constitute the principal part of the nervous system.

According to Spengel, the pair of ganglia near the mouth, variously called labial or cerebral, represent the cerebral pair and pleural pair of a gastropod combined, and the parieto-splanchic pair correspond to the visceral ganglia, the commissure which connects them with the cerebro-pleural representing the visceral commissure. Each of the visceral ganglia is connected or combined with an olfactory ganglion underlying an area of specialized epithelium, which constitutes the olfactory organ, the osphradium. The heart and pericardial chamber in the oyster lie along the anterior face of the adductor muscles,
almost perpendicular to the direction of the gills, with which in _Anodonta_ they are parallel. In _Anodonta_ and the majority of lamellibranchs the ventricle surrounds the intestine; in the oyster the two are quite independent, the intestine passing above the pericardium. The renal organs of the oyster were discovered by Hoek to agree in their morphological relations with those of other lamellibranchs.

The generative organs of the oyster consist of a system of branching cavities on each side of the body lying immediately beneath the surface. All the cavities of a side are ultimately in communication with an efficient duct opening on the surface of the body a little above the line of attachment of the gills. The genital opening on each side is situated in a depression of the surface into which the renal organ also opens. The genital products are derived from the cells which line the cavities of the genital organs. The researches of Hoek have shown that in the same oyster the genital organs at one time produce ova, at another spermatogonia, and that consequently the oyster does not fertilize itself. How many times the alternation of sex may take place in a season is not known. It must be borne in mind that in what follows the species of the European coasts, _Ostrea edulis_, is under consideration. The ova are fertilized in the genital duct, and before their escape have undergone the earliest stages of segmentation. After escaping from the genital aperture they find their way into the infra-branchial part of the mantle cavity of the parent, probably by passing through the supra-branchial chamber to the posterior extremity of the gills, and then being conducted by the inhalent current caused by the cilia of the gills into the infra-branchial chamber. In the latter they accumulate, being held together and fastened to the gills by a white viscid secretion. The mass of ova thus contained in the oyster is spoken of by oyster fishers as "white spat," and an oyster containing them is said to be "sick." While in this position the ova go through the earlier stages of development. At the end of a fortnight the white spat has become dark-coloured from the appearance of coloured patches in the developing embryos. The embryos having then reached the condition of "trophospheres" escape from the mantle cavity and swim about freely near the surface of the water among the multitude of other creatures, larval and adult, which swarm there. The larvae are extremely minute, about \(\frac{1}{3}\) an in. long and of glassy transparency, except in one or two spots which are dark brown. From the trophospheres stage the free larvae pass into that of "veligers." How long they remain free is not known; Huxley kept them in a glass vessel in this condition for a week. Ultimately they sink to the bottom and fix themselves to shells, stones or other objects, and rapidly take on the appearance of minute oysters, forming white disks \(\frac{1}{6}\) in. in diameter. The appearance of these minute oysters constitutes what the fishermen call a "fall of spat." The experiment by which Hoek conclusively proved the change of sex in the oyster was as follows. In an oyster containing white spat microscopic examination of the genital organs shows nothing but a few unexelled ova. An oyster in this condition was kept in an aquarium by itself for a fortnight, and after that period its genital organs were found to contain multitudes of spermatogonia in all stages of development.

The breeding season of the European oyster lasts from May to September. The rate of growth of the young oyster is, roughly speaking, an inch of diameter in a year, but after that it has attained a breadth of \(\frac{1}{2}\) in. its growth is much slower. Professor Möbius is of opinion that oysters over twenty years of age are rare, and that most of the adult Schleswig oysters are seven to ten years old.

The development of the American oyster, _O. virginiana_, and of the Portuguese oyster, _O. angulata_, is very similar to that of _O. edulis_, except that there is no period of incubation within the mantle cavity of the parent in the case of these two species. Hence it is that so-called artificial fertilization is possible; that is to say, fertilization will take place when ripe eggs and milt are artificially pressed from the oysters and allowed to fall into a vessel of sea-water. But if it is possible to procure a supply of spat from the American oyster by keeping the swarms of larvae in confinement, it ought to be possible in the case of the European oyster. All that would be necessary would be to take a number of mature oysters containing white spat and lay them down in tanks till the larvae escape. This would be merely carrying oyster culture a step farther back, and instead of collecting the newly fixed oysters, to obtain the free larvae in numbers and so insure a full of spat independently of the uncertainty of natural conditions. This method has been tried several times in England, in Holland and in France, but always without permanent success.

Natural beds of oysters occur on stony and shelly bottoms at depths varying from 3 to 20 fathoms. In nature the beds are liable to variations, and, although Huxley was somewhat sceptical on this point, it seems that they are easily brought into an unproductive condition by over-dredging. Oysters do not flourish in water containing less than 3% salt; and hence they are absent from the Baltic. The chief enemies of oysters are the dog-whelk, _Furupa lapillus_, and the whelk-tingle, _Marus erinaceus_, which bore through the shells. Starfishes devour large numbers; they are able to pull the valves of the shell apart and then to digest the body of the oyster by their everted stomach. _Ciona_, the boring sponge, destroys the shells and so injures the oyster; the boring annelid _Leucodore_ also excavates the shell.

The wandering life of the larvae makes it uncertain whether any of the progeny of a given oyster-bed will settle within its area and so keep up its numbers. It is known from the history of the Lümfford beds that the larvae may settle \(5\) m. from their place of birth.

The genus _Ostrea_ has a world-wide distribution, in tropical and temperate seas; seventy species have been distinguished. Its nearest allies are _Pinna_ among living forms, _Elasmia_ among fossils. For the so-called pearl-oyster see _PEARL_.

**Oyster Industry.**—Oysters are more valuable than any other single product of the fisheries, and in at least twenty-five countries are an important factor in the food-supply. The approximate value of the world's oyster crop approaches \(£4,000,000\) annually, representing over \(30,000,000\) bushels, or nearly \(10\) billion oysters. Not less than \(150,000\) persons are engaged in the industry, and the total number dependent thereon is fully half a million. The following table shows in general terms the yearly oyster product of the world:

*United States.*—The oyster is the chief fishery product in the United States. The states which lead in the quantity of oysters taken are Maryland, Virginia, New York, New Jersey and Connecticut; the annual value of the output in each of these is over \(£1,000,000\). Other states with important oyster interests are Rhode Island, North Carolina, Louisiana and California. The oyster fishers give employment to over \(36\) thousand fishermen, who man \(4000\) vessels, valued at \(£4,000,000\), and \(25\) thousand boats, valued at \(£1,470,000\); the value of the oysters landed at \(11,000\) tongs, rafts and other appliances used is \(£655,000\). The quantity of oysters taken in 1898 was \(26,853,760\) bushels, with a value of \(£12,567,405\). The output of cultivated oysters in 1899 was about \(9,800,000\) bushels, worth \(£8,400,000\).

*Canada.*—Oyster banks of some importance exist in the Gulf of St Lawrence and on the coast of British Columbia. All of the grounds have suffered depletion, and cultural methods to maintain the supply have been instituted. The oyster output of the Dominion has not exceeded \(200,000\) bushels in a single year, and in 1898 was \(134,140\) bushels, valued at \(£217,024\).

*United Kingdom.*—The natural oyster beds of Great Britain and Ireland have been among the most valuable of the fishery resources, and British oysters have been famous from time immemorial. The most important oyster region is the Thames estuary, the site of extensive planting operations. The present supply is largely from cultivated grounds. Important oyster-producing centres are...
immense oyster-beds in Pocomoke Sound, Maryland, have practically been destroyed by over-dredging, and many of the other beds of the United States are seriously damaged. The same is doubtless true of all the beds of Europe. It has also been demonstrated that under proper restriction great quantities of mature oysters, and seed oysters as well, may be taken from any region of natural oyster-beds without injurious effects. Parallel cases in agriculture and forestry will occur to every one. Möbius, in his most admirable essay Die Auster und Die Austernwirtschaft, has pointed out the proper means of preserving natural beds, declaring that, if the average profit from a bed of oysters is to remain permanently the same, a sufficient number of mother oysters must be left in it, so as not to diminish the capacity of maturing. He further shows that the productive capacity of a bed can only be maintained in one of two ways: (1) by diminishing the causes which destroy the young oysters, in which case the number of breeding oysters may safely be decreased; this, however, is practicable only under such favourable conditions as occur at Arcachon, where the beds may be kept under the constant control of the oyster-culturist; (2) by regulating the fishing on the natural beds in such a manner as to make them produce permanently the highest possible average quantity of oysters. Since the annual increase of half-grown oysters is estimated by him to be four hundred and twenty-one to every thousand full-grown oysters, he claims that not more than 42% of these latter ought to be taken from a bed during a year.

The Schleswig-Holstein oyster-beds are the property of the state, and are leased to a company whose interest is to preserve their productiveness. The French beds are also kept under government control. Not so the beds of Great Britain and America, which are as a general rule open to all comers, except when some close-time regulation is in force. Huxley has illustrated the futility of "close-time" in his remark that the prohibition of taking oysters from an oyster-bed during four months of the year is not the slightest security against its being stripped clean during the other eight months. "Suppose," he continues, "that in a country infested by wolves, you have a flock of sheep, keeping the wolves off during the lambing season will not afford much protection if you withdraw shepherd and dogs during the rest of the year." The old close-time laws were abolished in England in 1866, and returned to in 1876, but no results can be traced to the action of parliament in either case. Huxley's conclusions as regards the future of the oyster industry in Great Britain are doubtless just as applicable to other countries—that the only hope for the oyster consumer lies in the encouragement of oyster-culture, and in the development of some means of breeding oysters under such conditions that the spat shall be safely deposited. Oyster culture can evidently be carried on only by private enterprise, and the problem for legislation to solve is how to give such rights of property upon those shores which are favourable to oyster culture as may encourage competent persons to invest their money in that undertaking. Such property right should undoubtedly be extended to natural beds, or else an area of natural spawning territory should be kept under constant control and surveillance by government, for the purpose of maintaining an adequate supply of seed oysters.

The extension of the area of the natural beds is the second step in oyster culture. As is well known to zoologists, and as has been very lucidly set forth by Möbius, the location of oyster banks is sharply defined by absolute physical conditions. Within certain definite limits of depth, temperature and salinity, the only requirement is a suitable place for attachment. Oysters cannot thrive where the ground is composed of moving sand or where mud is deposited; consequently, since the size and number of these places are very limited, only a very small percentage of the young oysters can find a resting-place, and the remainder perish. Möbius estimates that for every oyster brought to

---

1 Even Huxley, the most ardent of all opponents of fishery legislation, while denying that oyster-beds had been permanently annihilated by dredging, practically admitted that a bed may be reduced to such a condition that the oyster will only be able to recover its former state by a long struggle with its enemies and competition—in fact that it must re-establish itself much in the same way as they have acquired possession of new grounds in Jutland, a process which, according to his own statement, occupied thirty years (Lecture at the Royal Institution, May 11th, 1883, printed with additions in the English Illustrated Magazine, i. pp. 47-55, 112-121).
OYSTER BAY

market from the Holstein banks, 1,045,000 are destroyed or die. By putting down suitable “cutch” or “stools” immense quantities of the water-bird fry may be induced to settle and are thus saved. As a rule the natural beds occupy most of the suitable space in their own vicinity. Unoccupied territory may, however, be prepared for the reception of new beds, by spreading sand, gravel and shells over muddy bottoms, or, indeed, beds may be kept up in locations for permanent natural beds, by putting down mature oysters and culch just before the time of breeding, thus giving the young a chance to fix themselves before the currents and enemies have had time to accomplish much in the way of destruction.

The collection of oyster spat upon artificial stools has been practised from time immemorial. As early as the 7th century, and probably before, the Romans practised a kind of oyster culture in Lake Avernus, which still survives to the present day in Lake Fusaro. Piles of rocks are made on the muddy bottoms of these salt-water lakes, and around these are arranged circles of stakes, to which are often attached bundles of twigs. Breeding oysters are piled upon the rockeries, and their young become attached to the stakes and twigs provided for their reception, whereby they are saved until the shells which are piled off and sent to the market. A similar though ruder device is used in the Poquonock river in Connecticut. Birch trees are thrown into the water near a natural bed of oysters, and the trunks and twigs become covered with spat; the trees are then dragged out upon the shore by oxen, and the young fry are broken off and laid down in the shallows to increase in size. In 1858 the methods of the Italian lakes were repeated at St Brieuc under the direction of Professor P. Coste, and from these experiments the art of artificial breeding as practised in France has been developed. There is, however, a marked distinction between oyster-culture and oyster-breeding.

In considering the oyster-culture in France it is necessary to distinguish the centres of production from the centres of rearing or fattening. The chief centres or regions of oyster production are two (1883), consequently the space formed by the Anse de St Brieuc is about 38,000 acres at high water, and only about 15,000 acres are under water at low tide. The water is saltier than the sea. At the beginning of the 19th century there were only natural oyster beds in the basin, and these produced 75 million oysters per annum. But in the middle of the century the natural beds had been almost exhausted and the system of government control, letting “parcs” to private tenants, and artificial cultivation was instituted. Certain beds near the banks were reserved and artificially cultivated. Cutch is placed upon them every year, and gathering of oysters upon them is allowed only at intervals of two or more years, when the authority thinks they are sufficiently stocked to permit of it. Thus there are the centres of production and the centres of rearing.

The spat on oysters: these are made of earthenware and concave on one side. One of the most important points in the system is the coating of the tiles with lime. It is necessary to detach the young oysters from the mother shells before they are increased in size; this could not be done without destroying the oysters if they were attached directly to the surface of the tile. The coating of lime or mortar is soft and brittle, and consequently the young oysters can easily be detached with a stout knife. The method of coating the tiles (débâche) consists in dipping them into a liquid mixture of lime and water. Sometimes lime only is used, sometimes equal quantities of lime and sand, or lime and mud. Often it is necessary to repeat the dipping, and for the second coat hydraulic lime may be used.

The tiles coated with lime are set out on the shore near the low-water mark of spring tides, at the beginning of the spatting season. This is earlier in the south of France than in England, being in the middle of June. Various methods are adopted for keeping the tiles in place and for arranging them in the position most favourable to the collection of spat. At Arcachon they are arranged in piles each layer being transverse to the line of the beach, and the space between them is so arranged that the top of the tiles is kept open. A wooden frame-work often surrounds the heap of tiles to prevent them being scattered by the waves.

In the following season, about April, the young oysters, then from 1 inch to 2 inches, are supposed to have grown enough and are placed in oyster cases (caisses ostréophiles) or in shallow ponds (cailloues) made on the fore-shore. The cases are about 8 in. deep, made with a wooden frame-work, and galvanized wire netting top and bottom. The cases are fixed on the fore-shore by means of short posts driven into the ground, so that they are raised about 9 in. or 1 ft. from the latter. The young oysters grow rapidly in these cases, and have to be thinned out as they grow larger. When they have been in the boxes a year they are large enough to be placed in the claires or simply scattered along the fore-shore.

In Brittany the chief seat of oyster production is the Gulf of Morbihan, where the estuaries of numerous small rivers furnish fore-shores suitable to the industry. Here the prevalence of mud is one of the chief obstacles, and for this reason the tile-collectors are usually fastened together by wire and suspended to posts (bülets en poulie). The oysters are reared on the mud banks near the mouth of July. The natural beds from which the supply of spat is derived, are, however, insufficiently protected, so that much poaching goes on.

These two regions of production, Arcachon and Morbihan supply oysters and spat to the coast of France, and to the rest of the world also. The cases with the young oysters on them are placed in enclosures during the winter, and débâche is carried on in the following summer.

In England the use of tiles has been tried on various occasions, in Cornwall on the river Fal, at Hayling Island and in Essex, but has nowhere become permanently established. The reasons for this are that the fall of spat is not usually very abundant, and the kind of labour required cannot be obtained at a cheap rate. In many places oysters are simply imported from France and Holland and laid down to grow, or are obtained by dredging from open grounds. At Whitstable most of the stock is thus obtained, but culch (i.e. dead shells) is here and elsewhere scattered over the greater part of the shore for the attachment of spat. The use of culch as a collector is a very ancient practice in England, and is still almost universally maintained. In the estuaries of Essex there are many private or semi-private oyster fisheries, where the method of culture is carried on in the same manner as on the coast. Where the spat are sorted out, and the suitable ones are selected for the market. Just before the close season the young oysters and all the rest that remain are scattered over the beds again, with quantities of culch, and these, when in season, are dug up by means of a spade, and sold at a profit, without importation. In some places where the ground is suitable culch is spread over the foreshores also to collect spat.

The genuine English “native” is produced in its greatest perfection in the Essex fisheries, and is probably the highest priced oyster in the world.

In addition to the literature quoted see also the following: Rapport sur les recherches concernant l’huître et l’ostréiculture publié par l’Office de la Marine à la suite des expériences faites en 1883 à Poquerolles (1884); P. Brocchi, Traité de l’ostréiculture (Paris, 1883); Bashford Dean, European Oyster Culture, Bulletin U.S. Fish Commission, vol. x. for 1890, vol. xi. for 1891; J. T. Cunningham, Report of the Fishery on Oyster-beds (in Report of Technical Instruction Committee of Cornwall (1890), 1900).

OYSTER BAY, a township of Nassau (formerly of Queens) county, New York, on Long Island, about 25 m. N.E. of Long Island City. Pop. (1890) 13,580, (1900) 16,334; (1910 census) 21,802. The township reaches from N. to S. across the island (here about 40 m. wide) in the shape of a rough wedge, the peninsula of Long Island lying between the N. and S. at the N.; on the northern shore is the tripartite Oyster Bay Harbor region, arm is Mill Neck creek, whose central branch is Oyster Bay harbor, and whose easternmost arm, called Cold Spring harbor, separates the township of Oyster Bay from the township of Huntington. On the south side of the township is South Oyster Bay, immediately east of the main body of the Great South bay; and between South Oyster Bay and the ocean lie several islands, the smaller and northermmost ones being marshy, and the southern, Jones or Seafood beach, being sandy and having on the ocean side the Zach's inlet and Jones Beach life-saving stations. The township is served by four branches of the Long Island railway; the Oyster Bay branch of the north shore to the village of Sea Cliff (incorporated in 1883; pop. 1910, 1694), on the E. side of Hempstead harbor, to Glen Cove, a large unincorporated village, immediately N.E. of Sea Cliff, to Locust Valley and to Mill Neck farther E., and to the village of Oyster Bay, the terminus of the branch, on Oyster Bay harbor; the Wading
River branch to Hicksville and to Syosset; a third branch to Farmingdale, which also has direct communication by railway with Hicksville; and the Montauk division to Massapequa, in the south-western part of the township on Massapequa Lake and Massapequa Creek, which empties into Oyster Bay. The villages served by the railway are the only important settlements; those on the hilly north shore are residential. To the north of the village of Oyster Bay, on a long peninsular beach called Centre Island, are the headquarters of the seawanhaka Yacht Club; and to the east of the same village, especially on Cove Neck, between Oyster Bay Harbor and Cold Spring Harbor, are many summer residences with fine grounds.

Massapequa, on the south shore, is a residential summer resort.

The villages of Hicksville and Farmingdale are rural; the former has many German settlers. Jericho, N.E. of Hicksville, is a stronghold of the Hicksite Quakers, who are mostly wealthy landowners. In Locust Valley is Friends’ Academy (1876), a secondary school for boys and girls. There are a few truck farms in the township, potatoes, cabbages and cucumbers for pickling being the principal crop; “Oyster Bay asparagus” was once a famous crop.

Oysters are cultivated on the Sound shore and there are clam beds in Oyster Bay. There are thousands of Oyster Bay oysters. In the village of Capt. Cove there is a large leather-boat factory.

Pieterssen de Vries, in his Voyages from Holland to America, makes the first mention of Oyster Bay Harbor, which he explored in June 1639. In the same month Sinderland (or Suddenart) wrote to James Forrest, deputy of William Alexander, earl of Stirling, “two little necks of land, the one upon the east side of Oyster Bay Harbor”; but Sinderland made no settlement. A settlement from Lynn, Mass., was attempted in 1640 but was prevented by Governor William Kieft. By the treaty signed at Hartford, Connecticut, on the 20th of September 1650 by the Commissioners of the United colonies of New England and those of New Netherland, all land east of the west side of Oyster Bay was granted to the English, and all land west to the Dutch; but the Dutch placed Oyster Bay, according to a letter of Pieter Stuyvesant written in 1659, two and a half leagues farther east than the New Englanders did.

In 1663 an Indian deed granted land at Oyster Bay to Peter Wright and others of Salem and Sandwich, Mass., who made a permanent settlement here; in 1665 William Jones, a former governor of Maryland, purchased it from the Indians for the sum of about 150

On Long Island about 1653, when he led a force which fought the only important engagement ever fought with the Indians on Long Island, in which the colonists destroyed the fortification at Fort Neck near the present Massapequa, of Tuckapouche, chief of the Massapequas, an Algonquian tribe, whose name meant “great pond.” Oyster Bay was for a time closely connected politically with New Haven, but in 1664 with the remainder of Long Island it came under the New York government of Richard Nicolls, to whose success Underhill had largely contributed by undermining Dutch influence on Long Island.

In 1680 a Friends’ meeting-house was built at Jericho, the home of Elias Hicks, near the present Hicksville, the site of which was owned by his family and which was named in his honour; and the Dutch built their first church in Oyster Bay in 1732. The harbour of Oyster Bay was a famous smuggling place at the close of the 17th century, when there was a customs house here. The first settlement on the “south side” of the town, a branch of the creek made about 1693, when the Massapequa Indians sold 6000 acres at the corner of Thomas Townsend, and his son-in-law Thomas Jones (1665-1713), who had fought for James II. at Boyne and Aghrim, who became a high sheriff of Queen’s county in 1704, and who was the founder of the family of Jones and Floyd-Jones, whose seat was Tryon Hall (built at South Oyster Bay, now Massapequa, in 1770); Thomas Jones (1731-1792), grandson of the first Thomas Jones, was a prominent Loyalist during the War of Independence and wrote a valuable History of New York during the Revolutionary War, first published in 1789.

OYSTER-CATCHER, a bird’s name which does not seem to occur in books until 1731, when M. Catesby (Nat. Hist. Carolina, i. p. 85) used it for a species which he observed to be abundant on the oyster-hanks left bare at low water in the rivers of Carolina, and believed to be fed principally upon those molluscs. In 1776 T. Pennant applied the name to the allied British species, which he and for nearly two hundred years many other English writers had called the “Sea-Fig.” The change, in spite of the misnomer—for, whatever may be the case elsewhere, in England the bird does not feed upon oysters—met with general approval, and the new name has, at least in books, almost wholly replaced what seems to have been the older one. The Oyster-catcher of Europe is the Haematopus ostralegus or Linnaeus, belonging to the group now called Limicola, and is generally included in the family Charadriidæ; though some writers have placed it in one of its own, Haematopodidae, chiefly on account of its peculiar bill—a long thin wedge, ending in a vertical edge. Its feet also are much more fleshy than are generally seen in the Plover family. In its strongly-contrasted plumage of black and white, with a coral-coloured bill, the Oyster-catcher is one of the most conspicuous birds of the European coasts, and in many parts is still very common. It is nearly always seen paired, though the pairs collect in prodigious flocks; and, when these are broken up, the birds are seen tumbling with each other in a most prodigious manner. helicopters, which are very marvellous, and even at the breeding-season, when most birds throw off their shyness, it is not easily approached within ordinary gunshot distance. The hen-bird commonly lays three clay-coloured eggs, blotched with black, in a very slight hollow on the ground not far from the sea. As incubation goes on the hollow is somewhat deepened, and perhaps some haum is added to its edge, so that at last a very fair nest is the result. The young, as in all Limicola, are at first clothed in down, so motled in colour as closely to resemble the shingle to which, if they be not hatched upon it, they are almost immediately taken by their parents, and there, on the slightest alarm, they squat close to elude observation. This species occurs on the British coasts (very seldom straying inland) all the year round; but there is some reason to think that those we have in winter are natives of more northern latitudes, while our homestead birds leave us. It ranges from Iceland to the shores of the Red Sea, and lives chiefly on marine worms, crustacea and such molluscs as it is able to obtain. It is commonly supposed to be capable of prizes Impetuses from their rock, and of opening the shells of mussels; but, though undoubtedly it feeds on both, further evidence as to the way in which it procures them is desirable. J. E. Harting informed the present writer that the birds seem to lay its head sideways on the ground, and then, grasping the limpet’s shell close to the rock between the mandibles, use them as scissor-blades to cut off the mollusc from its sticking-place. The Oyster-catcher is not highly esteemed as a bird for the table.

Differing from this species in the possession of a longer bill, in having much less white on its back, in the paler colour of its mantle, and in a few other points, is the ordinary American species, with at least three races, Haematopus palliatus. Except that its call-note, judging from description, is unlike that of the European bird, the habits of the two seem to be perfectly similar; and the same may be said indeed of all the other species. The Falkland Islands are frequented by a third, H. leucopus, very similar to the first, but with a black wing-line and the legs, while the Australian Region possesses a fourth, H. longirostris, with a very long bill as its name intimates, and no white on its

1. It seems, however, very possible, judging from its equivalents in other European languages, such as the Frisian Oesterwischer, the German Osterweisser, and the Dutch Oestervis, that the name “Oyster-catcher” may have been not a colonial invention but indigenous to the mother-country, though it had not found its way into print before. The French Huîtreier, however, appears to be a word derived by the French from the Dutch Visschier, now replaced by the French Pieu-de-Mer, the German Meereslocher, Sleetser, and so forth.

2. Whether it be the Haematopus, whose name is found in some editions of Pliny (lib. x. cap. 47) at best doubtful. Other editions have Haimatopus; but Hardouin prefers the former reading. Both words have passed into modern orthography, the latter as the generic name of the Siltet (q.v.); and some writers have blended the two in the strange and impossible compound Haematomopus.
Oystermouth-Ozieri

primaries. China, Japan and possibly eastern Asia in general have an Oyster-catcher which seems to be intermediate between the black and white kind. This has received the name of H. osculans; but doubts have been expressed as to its deserving specific recognition. Then we have a group of species in which the plumage is wholly or almost wholly black, and among them only do we find birds that fulfil the implication of the scientific name of the genus by having feet that may be called blood-red. H. niger, which frequents both coasts of the northern Pacific, has, it is true, yellow legs, but towards the extremity of South America its place is taken by H. ater, in which they are bright red, and this bird is further remarkable for its laterally compressed and much upturned bill. The South African H. capensis has also scarlet legs; but in the otherwise very similar bird of Australia and New Zealand, H. unicolor, these members are of a pale brick-colour.

Oystermouth, or The Mumbles, an urban district and seaside resort in the Gower division of Glamorganshire, south Wales, situated on the western bend of Swansea Bay, 4½ m. S.W. of Swansea, with which it is connected by the steam-tramway of the Swansea and Mumbles Railway Company, constructed in 1804. The London and North-Western railway has also a station at Mumbles Road, 2½ m. N. of Oystermouth. Pop. (1901) 4661. The castle, which belongs to the lord of Beauregard as lord of the seigniory of Gower, is an imposing ruin, nobly situated on a rocky knoll overlooking the bay. Its great hall and chapel with their traceried Gothic windows are fairly well preserved. The earliest structure (probably only a "peel" tower), built in the opening years of the 12th century, probably by Maurice de Londres, was destroyed by the Welsh in 1215. The early English features of the square keep indicate that it was soon rebuilt, by one of the De Breos lords (see Gower). In 1248 Edward I. stayed here two days as the guest of William de Breos, and from that time on it became the chief residence in Gower of the lords seignior and subsequently of their stewards, and their chancery was located here till its abolition in 1535. The parish church, which has an embattled tower, was restored in 1860, when fragments of Roman tessellated pavement were found in various parts of the churchyard. Roman coins were also found in the village in 1823 and 1837—all indicating that there had been a small settlement here in Roman times. The name of the castle appears in the Welsh chronicles as Ystum Llwnyarch, which, by the elision of the penultimate, was probably changed by false analogy into Oystermouth—the bay being noted for its oyster beds. Its church is mentioned in the cartulary of Gloucester (1141) as Ostrennau.

The village itself is straggling and uninteresting, but the high ground between it and the pretty bays of Langland and Caswell on the southern side of the headland fronting the open channel is dotted with well-built villas and commands magnificent views. The headland terminates in two rocky islands, which to sailors coming up the channel would appear like the breasts of "mammals," whence the comparatively modern name, The Mumbles, is supposed to be derived. On the outer of these rocks is situated the signal station of Caldey (1754) of the British and Foreign Harbour Trust. The district is rapidly increasing in popularity as a seaside resort. A pier was erected by the Mumbles Railway Company at a cost of £12,000 in 1808. The fishing industry, once prosperous, has much diminished in importance, but there are still oyster-beds in the bay.

Ozanam, Antoine Frédéric (1813-1853), French scholar, was born at Milan on the 23rd of April 1813. His family, which was of Jewish extraction, had been settled in the Lyonnais for many centuries, and had reached distinction in the third generation before Frédéric through Jacques Ozanam (1640-1717), an eminent mathematician. Ozanam's father, Antoine, served in the armies of the republic, but betook himself, on the advent of the empire, to trade, teaching, and finally medicine. The boy was brought up at Lyons and was strongly influenced by one of his masters, the Abbé Noirot. His conservative and religious instincts showed themselves early, and he published a pamphlet against Saint-Simonianism in 1831, which attracted the attention of Lamartine. In the following year he was sent to study law at Paris, where he fell in with the Ampère family, and through them with Chateaubriand, Lacordaire, Montalembert, and other leaders of the neo-Catholic movement. Whilst still a student he took up journalism and contributed considerably to Baily's Tribune catholique, which became (November 1, 1833) L'Univers. In conjunction with other young men he founded in May 1833 the celebrated charitable society of St Vincent de Paul, which numbered before his death upwards of two thousand members. He received the degree of doctor of law in 1836, and in 1838 that of doctor of letters with a thesis on Dante, which was the beginning of one of his best-known books. A year later he was appointed to a professorship of commercial law at Lyons, and in 1840 assistant professor of foreign literature at the Sorbonne. He married in June 1841, and visited Italy on his wedding tour. At Fauriel's death in 1844 he succeeded to the full professorship of foreign literature. The short remainder of his life was extremely busy with his professorial duties, his extensive literary occupations, and the work, which he still continued, of district-visiting as a member of the society of St Vincent de Paul. During the revolution of 1848, of which he took an unduly sanguine view, he once more turned journalist for a short time in the Ére nouvelle and other papers. He travelled extensively, and was in England at the time of the Exhibition of 1851. His naturally weak constitution fell a prey to consumption, which he hoped to cure by visiting Italy, but he died on his return at Marseilles on the 8th of September 1853.

Ozanam was the leading historical and literary critic in the neo-Catholic movement in France during the first half of the 19th century. He was more learned, more sincere, and more logical than Chateaubriand; less of a political partisan and less of a literary sentimentalist than Montalembert. In contemporary movements he was an earnest and conscientious advocate of Catholic democracy and socialism and of the view that the church should adapt itself to the changed political conditions consequent to the Revolution. In his writings he dwelt upon important contributions of historical Christianity, and maintained that, by continuing the work of the Caesars, the Catholic church had been the most potent factor in civilizing the invading barbarians and in organizing the life of the middle ages. He confessed that his object was "to prove the contrary thesis to Gibbon's," and, although any historian who begins with the desire to prove a thesis is quite sure to go more or less wrong, Ozanam no doubt administered a healthful antidote to the prevalent notion, particularly amongst English-speaking peoples, that the Catholic church had done far more to enslave than to elevate the human mind. His knowledge of medieval literature and his appreciative sympathy with medieval life admirably qualified him for his work, and his scholarly attainments are still highly esteemed.

His works were published in eleven volumes (Paris, 1862-1868). They include Deux chanceliers d'Angleterre, Bacon de Verulam et Saint Thomas de Cantorbéry (Paris, 1836); Dante et la philosophie catholique au XIIIème siècle (Paris, 1859; 2nd ed., enlarged 1854); Études germaniques (2 vols., Paris, 1837-1849), translated by A. C. Ozier as Histoire de l'Allemagne dans la période de l'Huit à l'Ampère (London, 1869); Documents inédits pour servir à l'histoire de l'Italie depuis le VIIIème siècle jusqu'au XIIème (Paris, 1860); Les poètes franciscains en Italie au XIIème siècle (Paris, 1862). His letters have been partially translated into English by A. Coates (London, 1886). There are French lives of Ozanam by his brother, C. A. Ozanam (Paris, 1882); Mme. E. Humbert (Paris, 1886); C. Huit (Paris, 1882); M. de Lamblcy (Paris, 1887); L. Curies (Paris, 1888); and the posthumous Oeuvres of Ozanam (Paris, 1886). Documents are of Cornwall (1886) and E. Hardy (Mainz, 1878); and an interesting English biography by Miss K. O'Meara (Edinburgh, 1867; 2nd ed., London, 1875).

Ozieri, a town of Sardinia in the province of Sassari, from which it is 34 m. E.S.E. by rail. Pop. (1901) 9355. It is situated 1380 ft. above sea-level on a steep slope, but faces north, and so is not very healthy. In the centre of the town is a square with a fine fountain of 1595. The cathedral was restored in 1848; it is the seat of the diocese of Bisacaro. The former cathedral of this diocese lies some distance to the N.W.; it is a fine Romanesque building of the 12th and 13th centuries. The district of Ozieri
OZOKERITE—OZONE

is famous for its butter—the only butter made in Sardinia—cheese and other pastoral products; cattle are also bred here.

OZOKERITE, or OZOCERITE (Gr. ὀζωκέριον, to emit odour, and κέρας, wax), mineral wax, a combustible mineral, which may be designated as crude native paraffin (q.v.), found in many localities in varying degrees of purity. Specimens have been obtained from Scotland, Northumberland and Wales, as well as from about thirty different countries. Of these occurrences the ozokerite of the island of Tchelesken, near Baku, and the deposits of Utah, U.S.A., deserve mention, though the last-named have been largely worked out. The sole sources of commercial supply are in Galicia, at Boryslaw, Dawniacz and Starunia, though the mineral is found at other points on both flanks of the Carpathians. Ozokerite-deposits are believed to have originated in much the same way as mineral veins, the slow evaporation and oxidation of petroleum having resulted in the deposition of its dissolved paraffin in the fissures and crevices previously occupied by the liquid. As found native, ozokerite varies from a very soft wax to a black mass as hard as gypsum. Its specific gravity ranges from 0.85 to 0.95, and its melting point from 58° to 100° C. It is soluble in ether, petroleum, benzene, turpentine, chloroform, carbon bisulphide, &c. Galician ozokerite varies in colour from light yellow to dark brown, and frequently appears green owing to dichroism. It usually melts at 62° C. Chemically, ozokerite consists of a mixture of various hydrocarbons, containing 85.7-88.6% by weight of carbon and 14.3-15.3% of hydrogen.

The mining of ozokerite was formerly carried on in Galicia by means of hand-labour, but in the modern ozokerite mines owned by the Boryslaw Actien Gesellschaft and the Galizische Kreditbank, the workings of which extend to a depth of 200 metres, and 225 metres respectively, electric power is employed for hauling, pumping and ventilating. In these mines there are the usual main shafts and galleries, the ozokerite being reached by levels driven along the strike of the deposit. The wax, as it reaches the surface, varies in purity, and, in new workings especially, only hand-picking is needed to separate the pure material. In other cases much earthy matter is mixed with the material, and then the rock or shale having been eliminated by hand-picking, the "wax-stone" is boiled with water in large coppers, when the pure wax rises to the surface. This is again melted without water, and the impurities are skimmed off, the material being then run into slightly conical cylindrical moulds and thus made into blocks for the market. The crude ozokerite is refined by treatment first with Nordhausen oil of vitriol, and subsequently with charcoal, when the ceresine or cerasin of commerce is obtained. The refined ozokerite or cerasine, which usually has a melting-point of 61° to 78° C., is largely used as an adulterant of beeswax, and is frequently coloured artificially to resemble that product in appearance.

On distillation in a current of superheated steam, ozokerite yields a candle-making material resembling the paraffin obtained from petroleum and shale-oil but of higher melting-point, and therefore of greater value if the candles made from it are to be used in hot climates. There are also obtained in the distillation light oils and a product resembling vaseline (q.v.). The residue in the stills consists of a hard, black, waxy substance, which, in admixture with india-rubber is employed under the name of okonite as an electrical insulator. From the residue a form of the material known as heel-ball, used to impart a polished surface to the heels and soles of boots, is also manufactured.

According to published statistics, the output of crude ozokerite in Galicia in 1906 and 1907 was as follows:

OZONE, allotropic oxygen, O₃. The first recorded observations of the substance are due to Van Marum (1789), who found that oxygen gas through which a stream of electric sparks had been passed, tarnished mercury and emitted a peculiar smell. In 1840 C. F. Schönbein (Pogg. Ann. 50, p. 616) showed that this substance was also present in the oxygen liberated during the electrolysis of acidulated water, and gave it the name ozone (Gr. ὀζωκέριον, to smell). Ozone mixed with an excess of oxygen is obtained by submitting dry oxygen to the silent electric discharge [at the temperature of liquid air, E. Briner and E. Durand (Comptes rendus, 1907, 145, p. 1273) obtained a 90% yield]; by the action of fluorne on water at 0° C. (H. Moissan, Comptes rendus, 1899, 129, p. 570); by the action of concentrated sulphuric acid or barium peroxide or on other peroxides and salts of peracids (A. v. Baeyer and V. Villiger, Ber. 1901, 34, p. 355); by passing oxygen over some heated metallic oxides, and by distilling potassium permanganate with concentrated sulphuric acid in vacuo. It is also formed during many processes of slow oxidation. For a description of the various forms of ozonizers used on the large scale see N. Otto, Rev. gén. de chimie pure et appliquée, 1900, ii. p. 405; W. Elworthy, Elekt. Zeits., 1904, ii. p. 1, and H. Güttelini (Comptes rendus, 1903, 136, p. 1653). Ozone is also produced by the action of cathode and ultra-violet rays on oxygen. These methods of preparation give an ozone diluted with a considerable amount of unaltered oxygen; A. Ladenburg (Ber. 1898, 37, pp. 2508, 2830) succeeded in liquefying ozonized oxygen with liquid air and then by fractional evaporation obtained a liquid containing between 80 and 90% of ozone.

Ozone is a colourless gas which possesses a characteristic smell. When strongly cooled it condenses to an indigo blue liquid which is extremely explosive (see LIQUID GASES). In ozonizing oxygen the volume of the gas diminishes, but if the gas be heated to about 300° C, it returns to its original volume and is found to be nothing but oxygen. The same change of ozone into oxygen may be brought about by contact with platinum black and other substances. Ozone is only very slightly soluble in water. It is a most powerful oxidizing agent, which rapidly attacks organic matter (hence in preparing the gas, all combustible solutions must not be used since they are instantly destroyed), bleaches vegetable colouring matters, and acts rapidly on most metals. It liberates iodine from solutions of potassium iodide, the reaction in neutral solution proceeding thus: O₃+2KI+H₂O=O₂+I₂+2KHO, whilst in acid solution the decomposition takes the following course: 4O₃+10HI=5I₂+H₂O+4H₂O+3O₂ (A. Ladenburg, Ber. 1901, 34, p. 1184). Ozone is decomposed by some metallic oxides, with regeneration of oxygen. It combines with many unsaturated carbon compounds to form ozonides (C. Harries, Ber. 1904, 37, pp. 839 et seq.).

The constitution of ozone has been determined by J. L. Soret (Ann. chim. phys., 1866 [4], 7, p. 113; 1868 [4], 13, p. 257), who showed that the diminution in volume when ozone is absorbed from ozonized oxygen by means of oil of turpentine is twice as great as the increase in volume observed when ozone is reconverted into oxygen on heating. This points to the gas possessing the molecular formula O₃. Confirmation was obtained by comparing the rate of diffusion of ozone with that of chlorine, which gave 24.8 as the value for the density of ozone, consequently the molecular formula must be O₃ (cf. B. C. Brodie, Phil. Trans., 1872, pt. ii. p. 435). More recently A. Ladenburg (Ber. 1901, 34, p. 631) has obtained as a mean value for the molecular weight the number 47-78, which corresponds with the above molecular formula. Ozone is used largely for sterilizing water.
The sixth letter of the English alphabet, the fifteenth in the Latin and the sixteenth in the Greek alphabet, the letter in its ordinary form having the symbol for $P$ before $D$. In the Phoenician alphabet, from which the Western alphabets are directly or indirectly derived, its shape, written from right to left, is $P$. In the Greek alphabet, when written from left to right, it takes the form $P$ or $Π$, the second form being much rarer in inscriptions than the first. Only very rarely and only in inscriptions of the 7th and 6th centuries B.C. are rounded forms $P$, $φ$ found. In Italy the Etruscan and Umbrian form $P$ (written from right to left), though more angular than the Phoenician symbol, resembles it more closely than it does the Greek. The earliest Roman form—on the inscription found in the Forum in 1890—is Greek in shape $?), though the second leg is barely visible. The Arabic $P$ is identical with the rarer Greek form. As time goes on the Roman form becomes more and more rounded $P$, but not till Imperial times is the semi-circle completed so as to form the symbol in the shape which it still retains $P$. The Semitic name $P$ became in Greek $π$, and has in the course of ages changed but little. The sound of $P$ throughout has been that of the breathed labial stop, as in the English $pin$. At the end of words $P$ is almost always pronounced as $p$. The sound is rather that of the ancient Greek $φ$, i.e. $p$, but $φ$ is generally now pronounced. This sound is found initially also in some dialects of English, as in the Irish pronunciation of $pig$ as $p-h$. For a remarkable interchange between $φ$ and $qu$ sounds which is found in many languages, see under $Q$.

PAARL, a town of the Cape Province, South Africa, 36 m. by rail E.N.E. of Cape Town. Pop. (1904), 11,293. The town is situated on the west bank of the Berg river, some 400 ft. above the sea. It stands on the coast plain near the foot of the Drakenstein mountains. West of the town the Paarl Berg rises from the plain. The berg is crowned by three great granite boulders, known as the Paarl, Britannia and Gordon Rock. The town is beautifully situated amid gardens, orange groves and vineyards. The chief public buildings are the two Dutch Reformed churches, the old church being a good specimen of colonial Dutch architecture, with gables, curves and thatched roof. Paarl is a thriving agricultural and viticultural centre, among its industries being the manufacture of wine and brandy, wagon and carriage building and harness making. South-east of the town are granite quarries. The wines produced in the district are among the best in South Africa, ranking second only to those of Constantia.

The Paarl is one of the oldest European towns in South Africa. It dates from 1687, the site for the new settlement being chosen by the governor, Simon van der Stell. It was named Paarl by the first settlers from the fancied resemblance of one of the boulders on the top of the hill, when glistening in the sun, to a gigantic pearl. Shortly afterwards several of the Huguenots who had sought refuge at the Cape after the revocation of the edict of Nantes were placed in the new settlement. The present inhabitants are largely descended from these Huguenots.

PABIANICE, a town of Russian Poland, in the government of Piotrkow, 30 m. N.W. of the town of Piotrkow, and 10 m. S.S.W. from Lodz railway station. Pop. (1897), 18,251. It lies amidst extensive forests round the head-waters of the Néz, which were the hunting-grounds of the Polish kings. It has woollen, cloth and paper mills, and manufactures agricultural implements.

PABNA, or PUBNA, a town and district of British India, in the Rajshahi division of Eastern Bengal and Assam. The town is situated on the river Ichhamati, near the old bed of the Ganges. Pop. (1901), 18,424. The district of Pabna has an area of 1839 sq. m. Pop. (1901), 1,426,401, showing an increase of 4-8% in the decade. It is bordered along its entire east face by the main stream of the Brahmaputra or Jamuna, and along its south-west face by the Ganges or Padma. It is entirely of alluvial origin, the silt of the annual inundations overlying strata of clay on sand. Apart from the two great bordering rivers, it is intersected by countless water-channels of varying magnitude, so that during the rainy season every village is accessible by boat and by boat only. Almost the whole area is one green rice-field, the uniform level being broken only by clumps of bamboos and fruit-trees, which conceal the village sites. The district is a modern creation of British rule, being first formed out of Rajshahi district in 1852, and possesses no history of its own. The staple crops are rice and jute. Sirajganj, on the Brahmaputra, is the largest mart for jute in Bengal. The Eastern Bengal railway cuts across the south-west corner of the district to Sara, where a bridge crosses the Ganges. The district was affected by the earthquake of the 12th of June 1897, which was most severely felt at Sirajganj.

PABST, FREDERICK (1836-1904), American brewer, was born at Nicholasville, in Saxony, on the 28th of March 1836. In 1848 he emigrated with his parents to Chicago. There he became, first a waiter in a hotel, then a cabin-boy on a Lake Michigan steamer, and eventually captain of one of these vessels. In this last capacity he made the acquaintance of a German, Philip Best, the owner of a small but prosperous brewery at Milwaukee, and married his daughter. In 1860 Pabst was taken into partnership in his father-in-law's brewery, and set himself to work to study the details of the business. After obtaining a thorough mastery of the art of brewing, Pabst turned his attention to extending the market for the beer, and before long had raised the output of the Best brewery to 100,000 barrels a year. The brewery was eventually converted into a public company, and its capital repeatedly increased in order to cope with the continually increasing trade.

PACA, the Brazilian name for a large, heavily-built, short-tailed rodent mammal, easily recognized by its spotted fur. This rodent, Coelogenys (or Agouti) paca, together with one or two other tropical American species, represents a genus near akin to the agoutis and included in the family Caviidae. Pacas may be distinguished from agoutis by their heavier and more compact build, the longitudinal rows of light spots on the fur, the five-toed hind-feet, and the peculiar structure of the skull, in which the cheek-bones are expanded to form large capsules on the sides of the face, each enclosing a cavity opening on the side of the cheek. Their habits are very similar to those of agoutis, but when pursued they invariably take to the water. The young, of which seldom more than one is produced at a birth, remain in the burrows for several months. The flesh is eaten in Brazil. Males may be distinguished from females by the skull, in which the outer surface of the cheek-bones is roughened in the former and smooth in the latter sex. The paca-rana (Dinomys branickii), from the highlands of Peru, differs, among other features, by its well-developed tail and the arrangement of the spines. (See Rodentia.)

PACATUS DREPAHUSI, LATINUS (or LATINUS), one of the Latin panegyrist, flourished at the end of the 4th century A.D. He probably came from Aquinum (Agen), in the south of France, in the territory of the Nitiobriges, and received his education in the rhetorical school of Burdigala (Bordeaux). He was the contemporary and intimate friend of Ausonius, who dedicated two of his minor works to Pacatus, and describes him as the greatest Latin poet after Virgil. Pacatus attained the rank of proconsul of Africa (A.D. 390) and held a confidential position at the imperial court. He is the author of an extant speech (ed. E. Bährs in Panegyrici latini, 1874, No. 12) delivered in the senate house at Rome (389) in honour of Theodosius I. It contains an account of the life and deeds of the emperor, the special subject of congratulation being the complete defeat of the usurper Maximus. The speech is one of the best of its...
PACCHIA AND PACCHIAROTTO—PACHISI

kind. Though not altogether free from exaggeration and flattery, it is marked by considerable dignity and self-restraint, and is thus more important as an historical document than similar productions.

The style is vivid, the language elegant but not necessarily simple, exhibiting familiarity with the best classical literature. The writer of the panegyric must be distinguished from Drepanius Florus, deacon of Lyons (c. 850), author of some Christian poems and prose theological works.

See M. Schanz, Geschichte der römischen Literatur (1904), iv. i.

PACCHIA, GIROLAMO DEL, and PACCHIAROTTO (or PACCHIAROTTI), JACOPO, two painters of the Senesian school. One or other of them produced some good pictures, which used to pass as the performance of Perugino; reclamation from Perugino, they were assigned to Pacchiarotto; now it is sufficiently settled that the good works are by G. del Pacchia, while nothing of Pacchiarotto’s own doing transcends mediocrity. The mythical Pacchiarotto who worked actively at Fontainebleau has no authenticity.

Girolamo del Pacchia, son of a Hungarian cannon-founder, was born, probably in Siena, in 1477. Having joined a turbulent club named the Bardotti he deserted from Siena in 1535, where he is said to have lived, and nothing of a later date is known about him. His most celebrated work is a fresco of the “Nativity of the Virgin,” in the chapel of S. Bernardino, Siena, graceful and tender, with a certain artificiality. Another renowned fresco, in the church of S. Caterina, represents that saint on her visit to St. Agnes of Montepulciano, who, having just expired, raises her foot by miracle. In the National Gallery of London there is a “Virgin and Child.” The forms of G. del Pacchia are fuller than those of Perugino (his principal model of style appears to have been in reality Franciabigio); the drawing is not always unquestionable; the female heads have sweetness and beauty of feature, and some of the colouring has noticeable force.

Pacchiarotto was born in Siena in 1474. In 1530 he took part in the conspiracy of the Libertini and Popolani, and in 1534 he joined the Bardotti. He had to hide for his life in 1531, and was concealed by the Observantine fathers in a tomb in the church of S. Giovanni. He was stoned in close to a new-built corpse, and got covered with vermin and dreadfully exhausted by the close of the second day. After a while he resumed work; he was exiled in 1539, but recalled in the following year, and in that year or soon afterwards he died. Among the few extant works with which he is still credited is an “Assumption of the Virgin,” in the Carmine of Siena. Other works rather dubiously attributed to him are in Siena, Buonconvento, Florence, Rome and London.

PACE, RICHARD (c. 1482–1536), English diplomatist, was educated at Winchester under Thomas Langton, at Padua, at Bologna, and probably at Oxford. In 1509 he went with Cardinal Christopher Bainbridge, archbishop of York, to Rome, where he won the esteem of Pope Leo X., who advised Henry VIII. to take him into his service. The English king did so, and in 1515 P. became his secretary and in 1516 a secretary of state. In 1515 P. went with him to the Swiss to attack France, and in 1510 he went to Germany to discuss with the electors the impending election to the imperial throne. He was made dean of St. Paul’s in 1510, and was also dean of Exeter and dean of Salisbury. He was present at the Field of the Cloth of Gold in 1520, and in 1521 he went to Venice with the object of winning the support of the republic for Wolsey, who was anxious at this time to become pope. At the end of 1526 he was recalled to England, and he died in 1536. His chief literary work was De fructu (Basel, 1517).

PACE (through O. Fr. pas, from Lat. passus, step, properly the stretch of the leg in walking, from pander, to stretch), one movement of the leg in walking; hence used of the amount of ground covered by each single movement, or generally of the speed at which anything moves. The word is also used of a measure of distance, taken from the position of one foot to the other in making a single “pace,” i.e. from 23 ft. (the military pace) to 1 yard. The Roman passus was reckoned from the position of the back foot at the beginning of the pace to the position of the same foot at the end of the movement, i.e. 5 Roman feet, 58½ English inches, hence the Roman mile, mile passus = 1,646 yards.

For pacing in horse-racing see Horse-racing.

PACHE, JEAN NICOLAS (1749–1824), French politician, was born in Paris, of Swiss parentage, the son of the concierge of the hotel of Marshal de Castries. He became tutor to the marshal’s children, and subsequently first secretary at the ministry of marine, head of supplies (munitionnaire général des vaises), and clothier of the king’s household. After spending several years in Switzerland with his family, he returned to France at the beginning of the Revolution. He was employed successively at the ministries of the interior and of war, and was appointed on the 20th of September 1793 third deputy suppléant of Paris by the Luxembourg section. Thus brought into notice, he was made minister of war in the following October. Pache was a Girondist himself, but aroused their hostility by his incompetence. He was supported, however, by Marat, and when he was superseded in the ministry of war by Beaunoville (Feb. 4, 1794) he was chosen mayor by the Parisians. In that capacity he contributed to the fall of the Girondists, but his relations with Hébert and Chaumette, and with the enemies of Robespierre led to his arrest on the 10th of May 1794. He owed his safety only to the amnesty of the 25th of October 1795. After acting as commissary to the civil hospitals of Paris in 1796, he retired from public life, and died at Thén-le-Moutier on the 18th of November 1823.

See L. Pierquin, Mémoires sur Pache (Charleville, 1900).

PACHECO, FRANCISCO (1571–1654), Spanish painter and art historian, was born at Seville in 1571. Favourable specimens of his style are to be seen in the Madrid picture gallery, and also in two churches at Alcalá de Guadaíra near Seville. He attained great popularity, and about the beginning of the 17th century opened an academy of painting which was largely attended. Of his pupils by far the most distinguished was Velázquez, who, afterwards became his son-in-law. From about 1625 he gave up painting and betook himself to literary society and pursuits; the most important of his works in this department is a treatise on the art of painting (Arie de la pintura: su antigüedad y grandezza, 1649), which is of considerable value for the information it contains on matters relating to Spanish art. He died in 1654.

PACHISI (Hindu pachis, twenty-five), the national table-game of India. In the palace of Akbar at Fatehpur Sikri the court of the zenana is divided into red and white squares, representing a pachisi-board, and here Akbar played the game with his courtiers, employing sixteen young slaves from his harem as living pieces. This was also done by the emperors of Delhi in their palace of Agra. A pachisi-board, which is usually embroidered on cloth, is marked with a cross of squares, each limb consisting of three rows of 8 squares, placed around a centre square. The outer rows each have ornaments on the four corners and the ends, making altogether 88 squares. The ornaments are small hollow boxes, each one containing a small piece of money, and each piece is marked with a number or symbol. The game is played in two rounds, the players moving to the end at the beginning of the first move, and to the centre square at the end of the second move. The pieces, of which each player has four, are coloured yellow, green, red and black, and are entered, one at a time, from the centre and move down the middle row, then round the entire board and up the middle row again to the home square. The moves are regulated by six cowrie shells, which are thrown by hand down a slight incline. The throws indicate the number of squares a piece may move, as well as whether the player shall have a “grace,” without which no piece, if taken, may be re-entered. A piece may be taken if another piece lands on the same square, unless the square be a castle. The object of each side is to
get all eight pieces round and home before the opponents can do so.

See Gomes, Ancient and Oriental, by E. Falkner (London, 1892).

Pachmann, Vladmir de (1838— ), Russian pianist, was born at Odessa, where his father was a professor at the university. He was educated in music at Vienna, and from 1860 to 1882 only rarely performed in public, being engaged in the meanwhile in musical study. He then obtained the greatest success, particularly as a player of Chopin, his brilliance of execution and rendering being no less remarkable than the playfulness of his platform manner.

Pachmanni, a hill-station and sanatorium for British troops in the Central Provinces of India. Popp. (1901), 3020, rising to double that number in the season. It is situated at a height of 3500 ft. on a plateau of the Satpura hills in Hoshangabad district, 32 m. by road from Piparla station on the Great Indian Peninsula railway. Though not free from fever in the hot season, it affords the best available retreat for the Central Provinces.

Pachomius, St (292-346), Egyptian monk, the founder of Christian cenobitical life, was born, probably in 292, at Esna in Upper Egypt, of heathen parents. He served as a conscript in one of Constantine's campaigns, and on his return became a Christian (314); he at once went to live an eremitical life near Dendera by the Nile, putting himself under the guidance of an aged hermit. After three or four years he was called (by an angel, says the legend) to establish a monastery of cenobits, or monks living in common (see Monasticism, § 4). Pachomius spent himself in organizing and directing the great order he had created, which at his death included nine monasteries with some three thousand monks and a nunnery. The order was called Tabennesi, from Tabennisi, near Dendera, the site of the first monastery. The most vivid account of the life and primitive rule is that given by Palladius in the Lausiac History, as witnessed by him (c. 410). Difficulties arose between Pachomius and the neighbouring bishops, which had to be composed at a synod at Esna. But St Athanasius was his firm friend and visited his monastery c. 330 and at a later period. Pachomius died (probably) in 346.

The best modern work on Pachomius is by P. Ladeuze, Le Cléobitsime pachomien (1898). There have been differences of opinion in regard to the dates; those given above are Ladeuze's, now generally accepted. The priority of the Greek Life of Pachomius over the Coptic may be said to be established; the historical character and value of this life are now fully recognized. A good analysis of all the literature is supplied in Herzog's Realencyclopadie (ed. 3).

Pachuca, a city of Mexico and capital of the state of Hidalgo, 55 m. direct and 68 m. by rail N.E. of the city of Mexico. Popp. (1900), 37,487. Pachuca's railway connexions include the Mexican, the Hidalgo and the Mexican Oriental, besides which it has 5 m. of tramway line. The town stands in a valley of an inland range of the Sierra Madre Oriental, at an elevation over 8000 ft. above the sea, and in the midst of several very rich mineral districts—Atanoleño el Chico, Capula, Potosí, Real del Monte, Santa Rosa and Tepené. It is said that some of these silver mines were known to the Indians before the discovery of America. Pachuca has some fine modern edifices, among which are the palace of justice, a scientific and literary institute, a school of mines and metallurgy, founded in 1877, a meteorological observatory and a public library. Mining is the chief occupation of its inhabitants, of whom about 7000 are employed. In 1900 the annual production of silver was 81,000 troy ounces, and the value of the silver mined there was $2,766,600. The principal rivers are the Regla and the Regla del Monte, which fall into the Rio Hondo at the foot of Rich's Falls in the vicinity. The city's industrial establishments include smelting works and a large number of reduction works, among which are some of the largest and most important in the republic. It was here that Bartolomé de Medina discovered the "pato" process of reducing silver ores with quicksilver in 1557, and his old hacinado de beneficio is still to be seen. Pachuca was founded in 1534, some time after the city was discovered. Here Pedro Romero del Terreros made the fortune in 1579 that enabled him to present a man-of-war to Spain and gain the title of Count of Regla. Pachuca was sacked in 1812, and so keen was the desire to possess its sources of wealth, in common with other mining towns, that mining operations were partially suspended for a time and the mines were greatly damaged. In 1824 the Real del Monte mines were sold to an English company and became the centre of a remarkable mining speculation—the company ran itself with lavish expenditures and discontinuing work in 1848. The mines in 1900 belonged to an American company.

Pachymeres, Georgius (1242-c. 1310), Byzantine historian and miscellaneous writer, was born at Nicaea, in Bithynia, where his father had taken refuge after the capture of Constantinople by the Latins in 1204. On their expulsion by Michael Palaeologus in 1261 Pachymeres settled in Constantinople, studied law, entered the church, and subsequently became chief advocate of the church (πράγματος) and chief justice of the imperial court (διανομήδης). His literary activity was considerable, his most important work being a Byzantine history in 13 books, in continuation of that of Georgios Acropolita from 1261 (or rather 1255) to 1308, containing the history of the reigns of Michael and Andronicus Palaeologus. He was also the author of rhetorical exercises on hackneyed sophistical themes; of a Quadrivium (Arithmetic, Music, Geometry, Astronomy), valuable for the history of music and astronomy in the middle ages; a general sketch of Aristotelian philosophy; a paraphrase of the speeches and letters of Dionysius Areopagiti; some, including an autobiography; and a description of the Augusteum, the colonnade erected by Justinian in the church of St Sophia to commemorate his victories over the Persians.

The History has been edited by I. Bekker (1834) in the Corpus scriptorum hist. byzantinam, also in J. P. Migne, Patrologia graeca, ed. xlii., cclxvii.; for editions of the minor works see C. Krumbacher, Geschichte der byzantinischen Literatur (1897).

Pacific Blockade, a term invented by Hautefeuille, the French writer on International Maritime Law, to describe a blockade exercised by a great power for the purpose of bringing pressure to bear on a weaker state without actual war. That it is an act of violence, and therefore in the nature of war, is undeniable, seeing that it can only be employed as a measure of coercion by maritime powers able to bring into action such vastly superior forces to those the resisting state can dispose of that resistance is out of the question. In this respect it is an act of war, and any attempt to exercise it against a power strong enough to resist would be a commencement of hostilities, and at once bring into play the rights and duties affecting neutrals. On the other hand, the object and justification of a pacific blockade being to avoid war, that general hostilities and disturbance of international traffic with the state against which the operation is carried on, rights of war cannot consistently be exercised against ships belonging to other states than those concerned. And yet, if neutrals were not to be affected by it, the coercive effect of such a blockade might be completely lost. Recent practice has been to limit interference with them to the extent barely necessary to carry out the purpose of the blockading powers.

It is usual to refer to the intervention of France, England and Russia in Turkish affairs in 1827 as the first occasion on which the coercive value of pacific blockades was put to the test. Neutral vessels were not affected by it. This was followed by a number of other coercive measures described in the textbooks as pacific blockades. The first case, however, in which the operation was really a blockade, accompanied by hostilities, and which therefore may be properly called a "pacific blockade," was that which in 1837 Great Britain exercised against New Granada. A British subject and consul of the name of Russell was accused of stabbing a native of the country in a street brawl. He was arrested, and after being kept in detention for some months he was tried for the unlawful carrying of arms and sentenced to death. The British government then interposed, and by a series of despatches, and a threatening interruption of trade, and a declaration of a state of war, rendered the operation a success. In 1862 and 1863 the governments of France and Italy proclaimed a blockade of certain ports of Venezuela and the mouths of the Orinoco. The blockade in this case was not official, but was with all its consequences for belligerents and neutrals (see Foreign Office notice in London Gazette of December 20, 1902).
sentenced to six years' imprisonment. The British government resented this treatment as "not only cruel and unjust towards Mr Russell, but disrespectful towards the British nation," and demanded the dismissal of the officials implicated and £1000 damages "as some compensation for the cruel injuries which had been inflicted upon Mr Russell" (State Papers, 1847–1838, p. 183). The New Granada government refused to comply with these demands, and the British representative, acting upon his instructions, called in the assistance of the West Indian fleet, but observed in his communication to the British naval officer in command that it was desirable to avoid hostilities, and to endeavour to bring about the desired result by a strict blockade only. This seems to be the first occasion on which it had occurred to anybody that a blockade without war might serve the purpose of war. This precedent was shortly afterwards followed by another somewhat similar case, in which from the 16th of April to the 28th of November 1838 the French government blacked the Mexican ports, to coerce the Mexican government into acceptance of certain demands on behalf of French subjects who had suffered injury to their persons and damage to their property through insufficient protection by the Mexican authorities.

The blockade of Buenos Aires and the Argentine coast from the 28th of March 1838 to the 7th of November 1840 by the French fleet, a coercive measure consequent upon vexatious laws affecting foreign residents in the Argentine Republic, seems to have been the first case in which the operation was notified to the different representatives of foreign states. This notification was given in Paris, and at Buenos Aires, and to every ship approaching the blockaded places. This precedent of notification was, a few years later (1845), followed in another blockade against the same country by Great Britain and France, and in one in 1842 and 1844 by Great Britain against the port of Greytown in Nicaragua. In 1850 Great Britain blockaded the ports of Greece in order to compel the Hellenic government to give satisfaction in the Don Pacifico case. Don Pacifico, a British subject, claimed £25,000 as damages for unprovoked pillage of his house by an Athenian mob. Greek vessels bona fide carrying cargoes belonging to foreigners were allowed to enter the blockaded ports.

Before the next case of blockade which can be described as "pacific" occurred came the Declaration of Paris (April 15, 1856), requiring that "blockades in order to be binding must be effective; that is to say, maintained by a force sufficient really to prevent access to the coast of the enemy."

Some ill-defined measures of blockade followed, such as that of 1860, when Victor Emmanuel, then king of Sardinia, joined the revolutionary government of Naples in blockading ports in Sicily, then held by the king of Naples, without any rupture of pacific relations between the two governments; that of 1862, in which Great Britain blockaded the port of Rio de Janeiro, to exact redress for pillage of an English vessel by the local population, at the same time declaring that she continued to be on friendly terms with the emperor of Brazil; and that in 1868, when government in Rome was made before the port of Dalmago by a fleet of British, German, French, and Russian men-of-war, to compel the Turkish government to carry out the treaty conceding this town to Montenegro, and it was announced that if the town was not given up by the Turkish forces it would be blockaded.

The blockade which first gave rise to serious theoretical discussion on the subject was that instituted by France in 1884 in Chinese waters. On the 20th of October 1884, Admiral Courbet declared a blockade of all the ports and roadsteads between certain specified points of the island of Formosa. The British government protested that Admiral Courbet had not enough ships to render the blockade effective, and that it was therefore a violation of one of the articles of the Declaration of Paris of 1856; moreover, that the French government could only interfere with neutral vessels violating the blockade if there was a state of war. If a state of war existed, England as a neutral was bound to close her coaling stations to belligerents. The British government held that in the circumstances France was waging war and not entitled to combine the rights of peace and warfare for her own benefit. Since the Pacific Blockades have only been exercised by the great powers as a joint measure in their common interest, which has also been that of peace; and in this respect the term is taking a new signification in accordance with the ordinary sense of the word "pacific."

In 1886 Greece was blockaded by Great Britain, Austria, Germany, Italy and Russia, to prevent her from engaging in war with Turkey, and thus forcing the powers to define their attitude towards the latter power. The instructions given to the British commander were to detain every ship under the Greek flag coming out of or entering any of the blockaded ports or harbours, or communicating with any ports within the limit blockaded; but if any ports of the cargo on board of such ships belonged to any subject or citizen of any foreign power other than Greece, and other than Austria, Germany, Italy and Russia, and had been shipped before notification of the blockade or after such notification, but under a charter made before the notification, such ship was not to be detained.

On the blockade of Crete in 1897 it was notified that "the admirals in command of the British, Austro-Hungarian, French, German, Italian, and Russian naval forces" had decided to put the island of Crete in a state of blockade, that "the blockade would be general for all ships under the Greek flag," and that "ships of the six powers or neutral powers may enter into the ports occupied by the powers and land their merchandise, but only if it is not for the Greek troops or the interior of the island," and that "these ships may be visited by the ships of the international fleets."

Since the adoption of the Hague Convention of 1907 respecting the limitation of the employment of force for the recovery of contract debts, the contracting powers are under agreement "not to have recourse to armed force for the recovery of contract debts claimed from the government of one country by the government of another country as being due to its nationals," unless "the debtor state refuses or neglects to reply to an offer of arbitration, or after accepting the offer prevents any compromise from being agreed on, or after the arbitration fails to submit to the award." (Art. 1). Though this does not affect Pacific blockades in principle, it superseded them in practice by a new procedure for some of the cases in which they have hitherto been employed. (T. BA.)

PACIFIC OCEAN, the largest division of the hydrosphere, lying between Asia and Australia and North and South America. It is nearly landlocked to the N., communicating with the Arctic Ocean only by Bering Strait, which is 36 m. wide and of small depth. The southern boundary is generally regarded as the parallel of 40° S., but sometimes the part of the great Southern Ocean (40° to 66½° S.) between the meridians passing through South Cape in Tasmania and Cape Horn is included. The north to south distance from Bering Strait to the Antarctic circle is 9,300 m., and the Pacific attains its greatest breadth, 10,000 m., at the equator. The coasts of the Pacific are of varied contour. The American coasts are for the most part mountainous, and the Gulf of California; the chief productive region along the Gulf of California; but the general type is departed from in the extreme north and south, the southern coast of South America consisting of bays and fjords with scattered islands, while the coast of Alaska is similarly broken in the south and becomes low and swampy towards the north. The coast of Australia is high and unbroken; there are no inlets of considerable size, although the small openings include some of the finest harbours in the world, as Moreton Bay and Port Jackson. The Asiatic coasts are for the most part low and irregular, and a number of seas are more or less completely enclosed and cut off from communication with the open ocean. Bering Sea is bounded by the Alaskan Peninsula and the chain of the Aleutian Islands; the sea of Okhotsk is enclosed by the peninsula of Kamchatka and the Kurile Islands; the Sea of Japan is shut off by Sakhalin Island, the Japanese Islands and the peninsula of Korea; the Yellow Sea is an opening between the coast of China and Korea;
the China Sea lies between the Asiatic continent and the island of Formosa, the Philippines group, Palawan and Borneo. Around the coasts of the Malay Archipelago for many miles are line of enclosed areas—the Sulu, Celebes, Java, Banda and Arafura seas. The Arafura Sea extends eastwards to Torres Strait, and beyond the strait is the Coral Sea, bounded by New Guinea, the islands of Melanesia and north-eastern Australia.

The area and volume of the Pacific Ocean and its seas, with the mean depths calculated therefrom, are given in the article Ocean.

Extent. The Pacific Ocean has one and three-quarter times the area of the Atlantic Ocean, and contains about one-third of the water of the hydrosphere—and has more than double its volume of water. Its area is greater than the whole land surface of the globe, and the volume of its waters is six times that of all the land above sea-level. The total land area draining to the Pacific is estimated by Murray to be 5,123,000,000 square miles, or 16,050,000,000 square kilometres, or 3,000,000,000 square miles. The volume of the area draining to the Atlantic is about 20,000,000,000 square miles. Amongst the most important river systems of the Pacific area is the Yangtsze-kiang: its length is 3,435 miles, its average width 70 miles, and its drainage area 250,000 square miles.

Relief of Bed. The greatest depth of the Pacific, at the South Sandwich Island, is 15,232 fathoms, according to the depth record taken by H.M.S. "Challenger." The Challenger discovered a very deep trough between 4° 17' S. and 147° 13' W., and another in 2° 10' S., 152° 15' W. Between these two areas, submarine mountains extend for a very considerable distance, corresponding to the zone of globigerina in the equatorial region of the Atlantic. Globigerina ooze covers considerable areas in the intermediate depths of the west and south Pacific—west of New Zealand, in the eastern Pacific, from 8° 30' S. to 12° 30' S., and 171° 30' W. to 150° 18' W.—but this deposit is not found in the north-eastern part of the basin. The total area covered by it is estimated at 38,472,000 square kilometres—about two-thirds of that in the Atlantic. In the southwest Pacific are found the islands of the Arafura, Banda, and Malacca seas; and the islands of the Indian Ocean, the Coral Sea, the Tasman Sea, the Tasmanian islands, and the South Island of New Zealand. In the southwest Pacific the west monsoon of Australia affects a belt running east of New Guinea to the Solomon Islands. In the east the north-east trade-belt extends between 5° S. and 25° S., and the southeast trade crosses the equator, and its mean southern limit is 25° S. The trade-winds are generally weaker and less persistent in the Pacific than in the Atlantic, and the intervening belt of equatorial calms is broader. Except in the narrow equatorial band, the trade-winds are generally separated by the north-east trade, which is most developed during the southern winter; at other seasons the regular trade-belt is cut across from north-west to south-east by a band twenty to thirty degrees wide, in which the trades alternate with south-west and north-east, and with calms, the trades prevailing chiefly at the boundaries of the region (5° N. to 5° S., 160° to 180° E.). This area, in which the south-east trade is interrupted, includes the Fiji, Navigator and Society groups, and the Paumotus. In the Marquesas group the trade-wind is constant. Within the southwest Pacific varies from south-west to north-east, and with calms, the trades prevailing chiefly at the boundaries of the region (5° N. to 5° S., 160° to 180° E.). This area, in which the south-east trade is interrupted, includes the Fiji, Navigator and Society groups, and the Paumotus. In the Marquesas group the trade-wind is constant. Within the southwest Pacific varies from south-west to north-east, and with calms, the trades prevailing chiefly at the boundaries of the region (5° N. to 5° S., 160° to 180° E.). This area, in which the south-east trade is interrupted, includes the Fiji, Navigator and Society groups, and the Paumotus. In the Marquesas group the trade-wind is constant. Within the southwest Pacific varies from south-west to north-east, and with calms, the trades prevailing chiefly at the boundaries of the region (5° N. to 5° S., 160° to 180° E.). This area, in which the south-east trade is interrupted, includes the Fiji, Navigator and Society groups, and the Paumotus. In the Marquesas group the trade-wind is constant. Within the southwest Pacific varies from south-west to north-east, and with calms, the trades prevailing chiefly at the boundaries of the region (5° N. to 5° S., 160° to 180° E.). This area, in which the south-east trade is interrupted, includes the Fiji, Navigator and Society groups, and the Paumotus. In the Marquesas group the trade-wind is constant. Within the southwest Pacific varies from south-west to north-east, and with calms, the trades prevailing chiefly at the boundaries of the region (5° N. to 5° S., 160° to 180° E.). This area, in which the south-east trade is interrupted, includes the Fiji, Navigator and Society groups, and the Paumotus. In the Marquesas group the trade-wind is constant. Within the southwest Pacific varies from south-west to north-east, and with calms, the trades prevailing chiefly at the boundaries of the region (5° N. to 5° S., 160° to 180° E.). This area, in which the south-east trade is interrupted, includes the Fiji, Navigator and Society groups, and the Paumotus. In the Marquesas group the trade-wind is constant. Within the southwest Pacific varies from south-west to north-east, and with calms, the trades prevailing chiefly at the boundaries of the region (5° N. to 5° S., 160° to 180° E.). This area, in which the south-east trade is interrupted, includes the Fiji, Navigator and Society groups, and the Paumotus. In the Marquesas group the trade-wind is constant. Within the southwest Pacific varies from south-west to north-east, and with calms, the trades prevailing chiefly at the boundaries of the region (5° N. to 5° S., 160° to 180° E.). This area, in which the south-east trade is interrupted, includes the Fiji, Navigator and Society groups, and the Paumotus. In the Marquesas group the trade-wind is constant. Within the southwest Pacific varies from south-west to north-east, and with calms, the trades prevailing chiefly at the boundaries of the region (5° N. to 5° S., 160° to 180° E.). This area, in which the south-east trade is interrupted, includes the Fiji, Navigator and Society groups, and the Paumotus. In the Marquesas group the trade-wind is constant. Within the southwest Pacific varies from south-west to north-east, and with calms, the trades prevailing chief...
Atlantic. The result is that north-westly winds, which in winter are exceedingly dry and cold, blow over the western or Asiatic area; westerly winds prevail in the centre, and south-westerly and southerly winds off the American coast. In the southern hemisphere the movement is quite the reverse, the low-pressure belt encircling the western, or South Pacific, in which westerly and north-westery winds continue all the year round.

The distribution of temperature in the waters of the Pacific Ocean is extremely irregular, a fact which has already been pointed out by the work of the Discovery of 1873-1874. In the North Pacific the temperature of the surface water, according to the American observations, by G. Schott. At the surface an extensive area of maximum temperature (over 20°C) occurs over 10° on each side of the equator to the west of the ocean. On the equator the water temperature falls to about 23°. The temperature is 2° higher to the north and 6° higher to the south. In the South Pacific, beyond lat. 40°S, the surface is generally warmer on the E. than on the W., but this condition is, on the whole, reversed in corresponding southern latitudes. In the Northern hemisphere the temperature is highest towards the west, and a remarkable distribution appears. A narrow strip of cold water runs along the equator, widest to the east and narrowing westward, and separates two areas of maximum which have their greatest interest in the west part of the ocean. The surface waters in the eastern part of the ocean, and those portions in higher latitudes as depth increases, apparently tending constantly to a position in about latitude 30° to 35° N. and S. A comparison of this distribution with that of atmospheric pressure is a great interest. In both the depth may be taken to mean descending air, just as high atmospheric pressure means descending air, and hence it would seem that the slow vertical movement of water in the Pacific reproduces some extent the phenomena of the atmosphere. But it is not so with the latitudes. With this difference, that the centres of minimum intensity lie off the land instead of the west as in the case of the continents. The isothermal lines, in fact, suggest that in the vast area of the Pacific something corresponding to the "planetary circulation" is established, and that the water in the western Pacific temperature units. During, therefore, a depth corresponding to that of the summit of the barriers which isolate them from the open ocean is reached, and below that point temperature is uniform to the bottom. In the Sulu Sea, for example, a temperature of 25° C. is reached by fathoms, and this remains constant to the bottom in 2500 fathoms.

The surface waters of the North Pacific are relatively fresh, the salinity being on the whole much lower than in the other great ocean. The east-west water blowing along the coast from the American coast on the north is colder to 160° E., then turning southwards to the equator. North of this salinity diminishes steadily, especially to the north-west, the Sea of Okhotsk showing the lowest salinity observed in any part of the globe. South and east of the axis mentioned salinity begins to increase again, increases again, and the saltiest waters of the whole Pacific are found, as we should expect, in the Pacific north-west and north-east of Japan, in the waters of the South Atlantic, but fresher than those of the North Atlantic.

The surface currents of the Pacific have not been studied in the same manner as those of the South Atlantic. The North Equatorial Current is due to the northeast trades. It splits into two parts east of the Philippines, one division flowing northwards as the Kuro Siwo or Black Stream, the analogue of the Gulf Stream, to feed a drift circulation which forms the boundary between the north-west and north-eastern gyres. The Californian Current southwards along the coast of the American east. Part of this renews the North Equatorial Current, and part probably forms the variable Mexican Current, which follows the coasts of Mexico and California close to the land. The Equatorial Counter-Cur of the east. The Kuro Siwo then continues along the east of the year by the south-west monsoon, and from July to October the south-west winds prevailing east of 150° E., further strengthen the current, but in the early season the winds weaken or even reverse, the Kuro Siwo retreats towards the islands. The surface water, which is more saline, is driven out of the east, and is more vigorous than its northern counterpart. Reaching the western Pacific part of this current passes southwards, east of New Zealand, and again east of Australia, as the East Australian Counter-Laureae Current or East Equatorial Current, and during the north-east monsoon part makes its way through the China Sea towards the Indian Ocean. During the south-west monsoon this branch is reversed, and the surface water, which has been driven out of the east, is driven back. The Kuro Siwo and the Asiatic coast a band of cold water, with a slight movement to the southward, known as the Oya Siwo, forms a feature of the "Cool Wall" of the Atlantic. In the higher latitudes of the South Pacific the surface movement forms part of the west wind-drift of the Roaring Forties. On the west coast of South America the cold waters of the Humboldt or Peruvian Current corresponding to the Benguela Current of the South Atlantic, make their way northward to the north-equatorial minimum of the South Equatorial Current. The surface circulation of the Pacific is, on the whole, less active than that of the Atlantic. The centres of the rotational movement are marked by "Sargasso Seas" in the north and south of the basin. The South Atlantic, and possibly also in parts of the Peru Current. The only movement in the Pacific, as it is the slow flow of ice-cold water northwards along the bottom from the South Ocean; but this is not the standard, and particularly gives cause for surprise, as the Arctic regions of the North Atlantic. From the known peculiarities of the distribution of temperature, it is probable that definite circulation of water is in the Pacific confined to the layers of winds near the surface, except in those cases of special importance, and possibly also in parts of the Peru Current.

ISLANDS OF THE PACIFIC

Up to a certain point, the islands of the Pacific fall into an obvious classification, partly physical, partly political. In the west there is the great looped chain which fringes the east coast of Asia, and with it encloses the series of seas which form parts of the ocean. The north of the chain, from the Kurils to Formosa, belongs to the empire of Japan; southward it is continued by the Philippines (belonging to the United States of America), which link it with the vast archipelago between the Pacific and Indian oceans, to which the name Malay Archipelago is commonly applied. As the loop of the Kurils depends from the southern extremity of Kamchatka, so from the east of the same peninsula another loop extends across the northern part of the ocean to Alaska, and helps to demarcate the Bering Sea; this chain is distinctly broken to the east of the Commander Islands, but is practically continuous thereafter under the name of the Aleutian Islands. Islands form a much less important feature of the American Pacific coast than of the Asiatic; between 45° N. and 38° S. there are practically none, and to the north and south of these parallels respectively the islands, though large and numerous, are purely continental, lying close under the mainland, enclosing no seas, and forming no separate political units. South-eastward of the Malay Archipelago lies the "largest island and the smallest continent," Australia; eastward of the archipelago, New Guinea, the largest island if Australia is not reckoned, is regarded as a continent only. With Australia is associated the islands lying close under its coasts, including Tasmania. Next follow the two great islands and attendant islets of New Zealand. Now there remains a vast number of small islands which lie chiefly (but not entirely) within an area which may be defined as extending from the Philippines, New Guinea and Australia to 130° W., and from tropic to tropic. These islands fall principally into a number of groups clearly enough defined to be well seen on a map of small scale; they are moreover divided, as will be shown, into three main divisions; but whereas they have enough characteristics in common to render a general view of them desirable, there is no well-recognized name to cover them all. The name Polynesia was formerly taken to do so, but belongs properly to one of the three main divisions, to which the name Eastern Polynesia was otherwise given; Oceanica and Oceanica are variants of another term which has been used for the same purpose, though by no means generally. Moreover, these same islands, lying close under the coasts of New Guinea, are divided into three main divisions, but the accompanying table shows the most usual classification, naming the principal groups within each, and distributing them according to the powers to which they are subject.

The following islands may be classified as oceanic, but not with any of the three main divisions: the Bonin Islands, north of the Marianas, belonging to Japan; Lord Howe and Norfolk Islands (to
New South Wales; Easter Island (to Chile); the Galápagos Islands (to Ecuador). In an area to be defined roughly as lying about the Tropic of Cancer, between Hawaii and the Bonin Islands, there are scattered a few small islands and reefs, of most of which the position, if not the existence, is doubtful. Such are Patrocinio (about 28° 30' N., 177° 18' E.) and Ganges (39° 47' N., 154° 15' E.), among others which appear on most maps. Marcus Island, in 23° 10' N., 154° E., was annexed by Japan in 1899 with a view to its becoming a cable station.

The following paragraphs review the oceanic islands generally, and are therefore concerned almost entirely with the central and mid-western parts of the ocean. It is impossible to estimate the total number of the islands; an atoll, for instance, which may slate in the Marquesas, which afford a type of the extinct volcanic islands, as does Tahiti. In other areas, however, there is still volcanic activity, and in many cases volcanoes to which only tradition attributes eruptions can hardly be classified as extinct. Hawaii contains the celebrated active crater of Kilauea. In Tonga, in the New Hebrides, and in the long chain of the Solomons and the Bismarck Archipelago there is much activity. Submarine vents sometimes break forth, locally raising the level of the sea-bottom, or even forming temporary islands or shoals. Earthquakes are not uncommon in the volcanic areas. Most of the volcanic islands are lofty in proportion to their size. The peaks or sharp cones in which they

be divided into a large number of islets, often bears a single name. The number of names of islands and separate groups in the Index to the Islands of the Pacific (W. T. Brigham), which covers the limited area under notice, is about 2,650, exclusive of alternative names. Of these, it may be mentioned, there is a vast number, owing in some cases to divergence of spelling in the representation of native names. In others, to European discoverers naming islands (sometimes twice or thrice successively) of which the native names subsequently came into use also.

The islands may be divided broadly into volcanic and coral islands, though the physiography of many islands is imperfectly known. There are ancient rocks, however, in New Caledonia, which has a geological affinity with New Zealand; old sedimentary rocks are known in New Pomerania, besides granite and porphyry, and slates, sandstone and chalk occur in Fiji, as well as young volcanic rocks. Along with these, similarly, hornblende and diabase occur in the Pelew Islands and gneiss and mica frequently culminate, combined with the rich characteristic vegetation, are the principal features which have led all travellers to exalt the beauty of the islands.

In the central and western Pacific the northern and southern limits of the occurrence of reef-forming corals are approximately 30° N. and 30° S. It may be added that this belt narrows greatly towards the east, mainly from the south, in sympathy with the northward flow of cold water off the coast of South America. But apart from this the limits are seen to accord fairly closely with the geographical definition of the area under consideration. Here the broad distinction has been drawn between volcanic and coral islands; but this requires amplification, both because the coral islands follow more than one type, and because the work of corals is in many cases associated with the volcanic islands in the form of fringing or barrier reefs. As to the distribution of coral reefs within the Pacific area, in Micronesia the northern Marianas (volcanic) are without reefs, which, however, are well developed in the south. The Pelew islands have extensive reefs, and the Caroline, Marshall and Gilbert islands are almost entirely coral. In Melanesia, as has been seen, the volcanic type predominates. Coral reefs occur round many of the islands (e.g. the Louisiade and Admiralty

</table>

The above figures give a total land area for the whole region of 69,561 sq. m, with a population of 978,130; but they are for the most part merely approximate.
among the most important kinds being the pigeons and doves, especially the fruit-eating pigeons. Megapodes are found in the Solomon Islands, the New Hebrides, Samoa, Tonga, the Carolines and the Maritans. The remarkable *diduncus* occurs in Samoa, and is the only member of its genus. It is found in the New Hebrides, and was compelled to change its habits dwelling in trees instead of on the ground. Insect life is rich in northern Melanesia; in southern Melanesia it is less so; in Fiji numerous kinds of insects occur, while in the southern islands the insect fauna is poor. But if this is true of the land fauna as a whole, especially on the atolls, where it consists mainly of a few birds, lizards and insects, the opposite is the case with the marine fauna. Fish are exceedingly abundant, especially in the lagoons of atolls. Various sorts of shellfish are found, and the whaling industry reached the height of its importance about the middle of the 19th century. In considering the marine fauna the remarkable *paolo* or *balolo* should be mentioned. This fish is commonly found at the surface and has eight fins. The occurrence of this process can be predicted exactly for one day, before sunrise, in October and November, and as both the worm and the fish which prey on it are appreciated by the natives as food, the occasions of its appearance are of great importance to them.

History.—Not long after the death of Columbus, and when the Portuguese traders, working from the west, had hardly reached the confines of the Malay Archipelago, the Spaniard Vasco Nuñez de Balboa crossed America at its narrowest part and discovered the great ocean to the west of it (1513). The belief in the short and direct westward passage from Europe to the East Indies was thus shaken, but it was still held that some passage was to be found, and in 1510-1521 Fernão de Magalhães (Magellan) made the famous voyage in which he discovered the strait which bears his name. Sailing thence north-westward for many weeks, over a sea so calm that he named it *El Mar pacifico*, he sighted only two small islands. These may have been Puka Puka of the Tuamotu Archipelago and Flint Island; but it may be stated here that the identification of islands sighted by the earlier explorers is often a matter of conjecture, and that there are islands which were visited after Magellan and are dated much later had in fact been seen by Europeans at this early period. In this narrative the familiar names of islands are used, irrespective of whether they were given by the first or later discoverers, or are native names. Magellan reached the "Ladrones" (MARIANAS) in 1521, and voyaged thence to the Philippines, where he was killed in a local war. In 1522-1524 various voyages of discovery were made on the west coast of America, partly in the hope of finding a strait connecting the two oceans to the region of the central isthmus. In 1525-1527 Garcia Jofre de Loyola sailed to the Moluccas, but, like Magellan, missed the bulk of the oceanic islands. About this time, however, the Portuguese sighted the north coast of New Guinea. Fuller knowledge of this coast was acquired by Alvaro de Saavedra (1537-1539), and among later voyagers those of Ruy Lopez de Villalobos (1542-1545) and Miguel Lopez de Legaspi (1564-1565) should be mentioned. These, however, like others of the early 16th century, were concerned with the southern edge of the Pacific islands, for the coast between the Spanish American and Asiatic possessions did not lead voyagers among the more extensive archipelagos. For the same reason the British and Dutch fleets which sailed with the object of harrying the Spaniards, under Sir Francis Drake (1577-1580), Thomas Cavendish (1586-1593) and Oliver van Noort (1598-1602), were not, as regards the Pacific, of prime geographical importance. But the theory of the existence of a great southern continent was now also attracting voyagers. Alvaro Mendaña de Neyra, after crossing a vast extent of ocean from Peru and sighting only one island, probably in the Ellice group, reached the Solomon Islands. In 1595-1596 he made a second voyage, and though he did not again reach these islands, the development of which was his objective, he discovered the Marquesas Islands, and afterwards Santa Cruz, where, having attempted to found a settlement, he died. Thereafter his pilot, Pedro Fernandez de Quiros, set out with the remainder of the company to make for the Philippines, and on
the way discovered Pohnpei of the Caroline Islands, some of which group, however, had been known to the Portuguese as early as 1527. Quiros returned to Europe, and, obtaining command of a fleet, made a voyage in 1605–1607 during which he observed some of the Paumotu and Society Islands, and later discovered the small Duff group of the Santa Cruz Islands, passing thence to the main island of the New Hebrides, which he hailed as his objective, the southern continent. One of his commanders, Luis Vaez de Torres, struck off to the north-west, coasted along the south of the Louisiade Archipelago and New Guinea, traversed the strait which bears his name between New Guinea and Australia, and reached the Philippines. In 1615–1617 two Dutchmen, Jacob Lemaire and Willem Cornelis Schouten, having in view both the discovery of the southern continent and the possibility of establishing relations with the East Indies from the east, took a course which brought them to the north part of the Paumotu Archipelago, thence to part of the Tonga chain, and ultimately to New Pomerania, after which they reached the East Indies. In 1642–1643 Abel Tasman, working from the east, discovered Van Diemen's Land (Tasmania) and the west coast of New Zealand, subsequently reaching the Tonga group, to which he gave the name of a Dutchman, Willem. Towards the close of the century the buccaneers extended their activity to the Pacific, but naturally added little to general knowledge. William Dampier, however, making various voyages in 1690–1705, explored the coasts of Australia and New Guinea, and at the opening of the century both the French and the Dutch showed some activity. The Dutchman Jacob Roggeveen, in the course of a voyage round the world in 1721–1722, crossed the Pacific from east to west, and discovered Easter Island, some of the northern islands of the Paumotu Archipelago, and (as is generally supposed) a part of the Samoan group. The voyage of Commodore George (afterwards Lord) Anson in 1740–1744 was for purposes rather of war than of exploration, and Commodore John Byron's voyage in 1765 had little result beyond gaining some additional knowledge of the Paumotu Archipelago.

It is about this time that what may be called the period of rediscovery set in fully. In the ensuing account a constant repetition of the names of the main archipelagoes will be noticed; it may of course be assumed that each successive voyager added something to the knowledge of them, but on the other hand, as has been said, islands were often rediscovered and renamed in cases where later voyagers took no account of the work of their predecessors, or where the earlier voyagers were unable clearly to define the positions of their discoveries. Moreover, rivalry between contemporary explorers of different nationalities sometimes caused them to ignore each other's work, and added to the confusion of nomenclature among the islands.

In 1767 Samuel Wallis worked through the central part of the Paumotus, and visited Tahiti and the Marianas, while his companion Philip Carteret discovered Pitcairn, and visited Santa Cruz, the Solomons and New Pomerania. The French were now taking a share in the work of discovery, and in 1768 Louis Antoine de Bougainville sailed by way of the central Paumotus, the Society Islands, Samoa, the northern New Hebrides, the south coast of New Guinea and the Louisiade and Bismarck Archipelagoes. The next voyages in chronological order are those of the celebrated Captain James Cook.

Within the limits of the area under notice, his first voyage (1769) included visits to Tahiti and the Society group generally, to New Zealand and to the east coast of Australia, his second voyage (1772–1774) to New Zealand, the Paumotu Archipelago, the Society Islands, Tonga and subsequently Easter Island, the Marquesas and the New Hebrides; and his third (1777–1778) to Tonga, the Cook or Norway group, and the Hawaiian Islands, of which, even if they were previously known to the Spaniards, he may be called the discoverer, and where he was subsequently killed. In 1786 Jean François Galoup de La Pérouse, in the course of the famous voyage from which he never returned, visited Easter Island, Samoa and Tonga. The still more famous voyage of William Bligh of the "Bounty" (1788) was followed by that of Captain Edwards of the "Pandora" (1791), who in the course of his search for Bligh discovered Rotumah and other islands. The Hawaiian Islands came within the purview of George Vancouver, following the course of Cook in 1791. In 1797 Joseph Antoine d'Entrecasteaux, searching for traces of La Pérouse, ranged the islands west of Tonga. In 1797 Captain J. Wilson of the missionary ship "Duft" visited the Society group, Fiji, Tonga and the Marquesas, and added to the knowledge of the Paumotu and Caroline Islands. Another power entered on the field of exploration when the Russians sent Adam Ivan Kruzenshtern to the Pacific (1803). He was followed by Otto von Kotzebue (1816) and Fabian Gottlieb von Bellingshausen (1819–1821). The work of these three was carried out principally in the easternmost part of Polynesia. In 1815–1819 the French navigator Louis Claude Desaules de Freycinet ranged from New Guinea through the Maritans to Hawaii. Two of his countrymen followed him in 1822–1826—Louis Isidore Dupuyer and Dumont d'Urville. Kotzebue made a second voyage, accompanied by scientists, in 1825–1826. In 1826–1828 Frederick William Beechey was at work in the middle parts of the ocean, and Fedor Petrovich Count Litke, the Russian circumnavigator, in the western Pacific. In 1834 Dr Duff Bennett made scientific researches in the Society Islands, returning in 1835 Captain Robert Fitzroy was accompanied by Charles Darwin, and in 1836 sqq., Abel Aubert du Petit-Thouars was carrying on the work of the French in the Pacific. During his voyage of 1837–1840, Dumont d'Urville was again in Polynesia, working westward from the Paumotu and Marquesas Islands by Fiji and the Solomon, Loyalty and Louisiade groups to New Guinea. In 1839 sqq. the first important American expedition was made under Charles Wilkes, who covered a great extent of the ocean from Hawaii to Tonga, Fiji and New Zealand. Among later British explorers may be mentioned Captain J. Elphinstone Erskine (1849) and Captain H. M. Denham, and several important voyages for scientific research were made in the second half of the 19th century, including one from Austria under Captain Wüllerstorff Urbair (1858), and one from Italy in the vessel "Magenta" (1850–1858), which was accompanied by the scientist Dr Enrico Giglioli. The celebrated voyage of H.M.S."Challenger" (1874–1875) and those of the American vessels "Tuscarora" (1833–1837) and "Albatross" (1888–1892) may complete the tale.

Whalers, sealers and traders followed in the wake of explorers, the traders dealing chiefly in copra, trepang, pearls, tortoise-shell, &c. The first actual settlers in the islands were largely men of bad character—deserting sailors, escapers from the penal settlements in Australia and others. It is not to be supposed that there were no orderly colonists, but that the natives suffered much at the hands of Europeans and Americans is only too clear. The class of traders who made a living by disreputable means and attempted to keep a monopoly of the island on which they settled, became notorious under the name of "beachcombers," and for each of the many dark chapters in Polynesian history there must have been many more unwritten. The kidnapping of natives for the South American and Australian labour markets was common. It cannot be denied that there has been actual deterioration of the native races, and elimination in their numbers, consequent upon contact with Europeans and Americans (see further, Polynesia). The romantic character of Polynesian history has perhaps, however, tended to emphasize its dark side, and it is well to turn from it to recognize the work of the missionaries, who found in the Pacific one of their most extensive and important fields of labour, and have exercised not only a moral, but also a profound political influence in the islands since the London Missionary Society first established its agents in Tahiti in 1797. Many of them, moreover, have added greatly to the scientific knowledge of the islands and their inhabitants. The imposition of strict rules of life upon the natives was in some instances carried too far; in others their conversion to Christianity was little more than nominal, but cases of this sort are overshadowed by the fine work of William Ellis and John Williams (c. 1818) and many of their successors.

The discovery of sandalwood in Fiji in 1804, and the establishment of a trade therein, made that group a centre of interest
in the early modern history of the Pacific islands. Moreover the London Missionary Society, having worked westward from its headquarters in Tahiti to Tonga as early as 1797, founded a settlement in Fiji in 1835. Meanwhile the white traders in Fiji had played an intimate part in the internal political affairs of the group, and in 1838 King Thakombau, being threatened with rape by the American consul on account of certain losses of property which he had sustained, asked for British protection, but did not obtain it. The British, however, were paramount among the white population, and as by 1870 not only American, but also German influence was extending through the islands (the first German government vessel visited Fiji in 1872), annexation was urged on Great Britain by Australia and New Zealand. Meanwhile the labour traffic, which had been initiated, so far as the Pacific islands were concerned, by an unsuccessful attempt in 1847 to employ New Hebridean labourers on a settlement near the present township of Eden in New South Wales, had attained considerable proportions, and was improperly exploited and, as already indicated, had led the natives to retaliation, sometimes without discernment, a notorious example of this (as was generally considered) being the murder of Bishop Patteson in 1871. In 1872 an act was passed by the British government to regulate the labour traffic; Fiji was annexed in 1874, and in 1875 another act established the protectorate over the islands.

In 1840 the French had formally annexed the Marquesas Islands; and subsequently extended their sphere, as shown in the table at the outset of this article, both in the east of Polynesia and in the south of Melanesia. In some of the island-groups independent native states were recognised for some time by the powers, as in the case of Hawaii, which, after the deposition of the king in 1832 and the proclamation of a republic in 1842, was annexed to the United States of America only in 1898, or, again, in the case of Tonga, which provided a curious example of the subdivision of a native organisation to unauthorized foreign influence. The partition of Polynesia was completed in 1899, when Samoa was divided between Germany and the United States. In Micronesia, since the discoveries of the early Spanish navigators, the Carolines, Mariana and Pelew Islands had been recognised as Spanish territory until 1897, when Germany began to establish itself in the first-named group. Spain had never occupied this group, but protested against the German action, and Pope Leo XIII. as arbitrator awarded the Carolines to her. Theretofore Spain's attempts at occupation, about which little was heard, have been native-ensued, and in 1899 the islands were sold to Germany, which thus becomes the predominating power in Micronesia. When Germany acquired the Bismarck Archipelago in Melanesia the introduction of German names (New Pomerania, New Pommer, New Neukleven for New Ireland; New Langenburg for the Duke of York Group, &c,) met with no little protest as contrary to precedent and international etiquette. The provision for the joint influence of Great Britain and France over the New Hebrides (1906) brought these islands into some prominence owing to the hostile criticism directed against the British government both in Australia and at home. The partition of the Pacific islands never led to any serious friction between the powers, though the acquisition of Hawaii was attempted by Britain, France and Japan before the United States annexed the group, and the negotiations as to Samoa threatened trouble for a while. There were occasional native risings, as in Samoa (where, however, the fighting was rather in the nature of civil warfare), the French possessions in eastern Polynesia, and the New Hebrides, apart from attacks on individual settlers or visitors, which have occurred here and there from the earliest period of exploration.

Administration.—Of the British possessions among the islands of the Pacific, Fiji is a colony, and its government is also high commissi-on for the western Pacific. In this capacity, assisted by deputies and resident commissioners, he exercises jurisdiction over all the islands except Fiji and those islands which are attached to New Zealand and New South Wales. Some of the islands (e.g. Tonga) are native states under British protection. Pitcairn, in accordance with its peculiar conditions of settlement, has a peculiar system of local government. The New Hebrides are under a mixed British and French commission. The Hawaiian Islands form a territory of the United States of America and are administered as such; Guam is a United States territory, as are also the Marshall Islands, the Caroline Islands, the Mariana Islands, the western Carolines and the eastern Carolines, and the western Carolines and Marianas. The Marshall Islands form a district (Bezirk) within the same administrative area. The German Samoan government is also under British control.

 Races.—In the oceanic islands of the Pacific three different peoples occur, who have been known as Melanesians, Polynesians and Micronesians. These form themselves naturally into two broad but very different groups—the dark and brown races; the first division being represented by the Melanesians, and the Polynesians and Micronesians together forming the second. The Melanesians, sometimes called Papuans (q.v.), the Malay name for the natives of New Guinea, the headquarters of the race), are physically negroid in type and have very high cheek bones, black hair and black lips. In all essentials they agree with the African type: such variations as there are, for example, the more developed eyebrow ridges, narrower, often prominent nose, and somewhat higher narrower forehead, which is a type of Polynesian, etc., are due to the Polynesian races. The oceanic black peoples must thus be regarded as having a connexion more or less remote with the African negroes. Whether the two families have a common ancestor in the Malay Peninsula or the Far East, or whether, as is now certain, the Papuan and Negro are alike branches of an African black race, is a problem yet to be solved. If their origin is unknown, there is little doubt that the Melanesians were the earliest occupants of Polynesia. The first of them, who are probably a Papuan stock, undoubtedly constitute the oldest ethnic stock sometimes modified on the spot by crossings with migratory peoples (Malays, Polynesians); sometimes, as in the eastern Pacific, giving way entirely before the Polynesians. The Melanesians have had nothing to do with the Polynesians. The islanders of Micronesia refer to a black indigenous race which occupied their islands when their ancestors arrived, and the black woolly-haired Papuan type is not only found to-day in Melanesia proper, but traces of it occur throughout Polynesia and Micronesia. That the oceanic black peoples have the same origin as the Papuan stock, however, is evidenced by evidence of the immensely remote date at which their dispersion began that they have a multitude of languages often unintelligible except locally, and an extraordinary variety of insular customs: differentiation has long been accepted as an ethnological fact, and it is evident that the Rev. H. R. Codrington (Melanesian Languages) has added evidence to prove that Melanesia is the most primitive form of the oceanic stock-language, and that both Malays and Polynesians have been derived from it. Further, it is evident that theMicronesians, who migrated at a remote period possibly in Neolithic times from the Asiatic mainland travelling by way of the Melanesian Archipelago and gradually colonizing the eastern Pacific. The Polynesians, who, as representatives of a more advanced race, have been spread wherever they have gone, do not differ from the Micronesians in the physical equal of Europeans, are of a light brown colour, tall, well-proportioned, with regular and often beautiful features. Such an explanation of the Polynesian's origin does not preclude a relationship with the Malays. It is more probable that the ancestors of the Polynesians remain today, what they must have always been in remote times, a distinct race. Of their subdivision, the Micronesians, the same cannot be said. They are undoubtedly a very hybrid race, owing this characteristic to their geographical position in the area where the dominating races of the Pacific, Malays, Polynesians, Melanesians, Japanese

1 From these the three main divisions of the islands are named POLYNESIA, MELANESIA, MICRONESIA (q.v.).
and Chinese, may be said to converge. Careful investigations have supported the theory that Micronesia was peopled largely from the Philippines or some portion of the Malay Archipelago at a much later period than the Polynesian migration. The Micronesians then are probably of Malay stock much modified by those from Micronesia. The people of the Pacific islands an imaginary ethnological line has been drawn round it so as to include none but the branches of the two great divisions. But on the borders of the region, often without real boundary lines, are grouped other peoples, the so-called Chinese. Within, people who are classed by some as being of Polynesian stock and by others of Malay stock and to the westward and the Australians, who are generally admitted to be a distinct race. Of these races detailed information will be found under their several headings.

One of the most obscure questions with which the ethnologist has to deal is that of the prehistoric remains which occur in different and widely separated parts of the oceanic region. The most remarkable of these are the Easter Island, where immense platforms (built of dressed stones) without a mortal have been found, together with stone images. Similar remains have been found on Pitcairn Island. On the island of Tongatabu in the Tonga group, there is a monument of great stone blocks which must have been brought from the sea by sea, and again, there are extensive remains of stone buildings, and in the Marianas stone monuments occur. No native traditions assign origin to these remains, nor has any complete explanation of their meaning offered.

BIBLIOGRAPHY—For the results of the various voyages of explorers see their narratives, especially those of Captain Cook, and among the earlier Collections of voyages see especially Captain James Cook, and the following publications in the Pacific—earliest navigators to 1764—(London, 1803–1817). Of general works (which are few) see C. E. Meinicke, Die Inseln des Stillen Oceans (Leipzig, 1875); F. H. H. Guillermard, Australasia, vol. ii., revised by A. H. Keane, in Standard's Compendium of Geography and Travel (London, 1901); and W. E. Crook, Index to the Islands of the Pacific (Honolulu, 1900). PACK, OTTO VON (c. 1480–1537), German conspirator, studied at the university of Leipzig, and obtained a responsible position under George, duke of Saxony, which he lost owing to his dishonesty. In 1528 he revealed to Philip, landgrave of Hesse, the details of a scheme agreed upon in Breslau by the archduke Ferdinand, afterwards the emperor Ferdinand I. and other influential princes, to conquer Hungary for Ferdinand and then to attack the reformers in Germany. Pack was sent to Hungary to concert joint measures with John Zápolya, the opponent of Ferdinand in that country; but John, elector of Saxony, who had advised Ferdinand to send Pack, was asked to explain their conduct, and Pack's revelations were discovered to be false, the copy of the treaty which he had shown to Philip proving to be a forgery. For some time Pack lived the life of a fugitive, finally reaching the Netherlands, where he was seized at the request of Duke George. Examined under torture he admitted the forgery, and the government of the Netherlands passed sentence of death, which was carried out on the 8th of February 1537. This affair has given rise to an acute controversy as to whether Philip of Hesse was himself deceived by Pack, or was his assistant in concocting the plot. See W. Schomburgk, Die Pachskens Händel (Leipzig, 1882); H. Schwartz, Landgraf Philipp von Hessen und die Packskens Händel (Leipzig, 1881); E. Heiss, Geschichte der Pachskens Händel (Freiburg, 1881) and Landgraf Philipp von Hessen und Otto von Pack (Freiburg, 1886); and L. von Ranke, Deutsche Geschichte im Zeitalter der Reformation (Leipzig, 1882).

PACK (apparently from the root pak-, pdaq-, seen in Lat. pangere, to fasten; cf. "compact"), primarily a bundle or parcel of goods securely wrapped and fastened for transport. The word, in this sense, is of common occurrence, in peddlers, by peddlers. It was in use early, according to the New English Dictionary, in the wool trade, and may have been introduced from the Netherlands. As a measure of weight or quantity the term has been in use, chiefly locally, for various commodities, e.g. of wool, 240 lb. of gold-leaf 20 books of 25 leaves each. In a transferred sense, a "pack" is a collection or gathering of persons, animals or things; and the verb means generally to gather together in a compact body. "Pack-ice" is the floating ice which covers wide areas in the polar seas, broken into large pieces which are driven (packed) together by wind and current so as to form practically a continuous sheet. "Packet," a small parcel, a diminutive of "pack," was first confined in meaning to a parcel of despatches carried by a post, especially the state despatches or "mail"; and "packet" properly "packet-boat," was the name given to the vessels which carried these state despatches.

PACKER, ASA (1824–1879), American capitalist, was born in Mystic, Connecticut, on the 20th of December 1824. In 1828 he became a carpenter's apprentice at Brooklyn, Susquehanna county, Pennsylvania. He worked as a carpenter in New York City for a time and then in Springville, Pennsylvania, but in 1833 settled at Mauch Chunk, in the Lehigh Valley, where he became the owner of a canal-boat (carrying coal to Philadelphia), and then established the firm of A. & R. W. Packer, which built canal-boats and locks for the Lehigh Coal & Navigation Company, probably the first through shippers to New York. He urged upon the Coal & Navigation Company the advantage of a steam railway as coal carrier, but the project was not then considered feasible. In 1835 the majority of the stock of the Delaware, Lehigh, Schuykill & Susquehanna Railroad Company (incorporated in 1846), which became the Lehigh Valley Railroad Company in January 1853, came into his control, and between November 1852 and September 1855 a railway line was built for the company, largely by Packer's personal credit, from November 1849 to 1855 the company was controlled by Mr. Packer, or by others acting under Packer's authority, and between 1852 and 1855 the company, by which Packer was connected by a main line with coal-mines in Luzerne and Schuylkill counties; and he planned and built the extension (completed in 1868) of the line into the Susquehanna Valley and thence into New York state to connect at Waverly with the Erie railway. Packer also took an active part in politics. In 1841 and 1842 he was a member of the Pennsylvania House of Representatives; in 1843–1848 was county judge of Carbon county; in 1853–1857 was a Democratic member of the national House of Representatives; and in 1859 was the Democratic candidate for the governorship of Pennsylvania. In 1865 he gave $500,000 and 60 acres (afterwards increased to 115 acres) in South Bethlehem, Pennsylvania, for a technical school for the professions represented in the development of the Lehigh Valley; Lehigh University was chartered in 1866, and its main building, Packer Hall, was completed in 1869; he erected a library building in 1877 as a
memorial to his daughter, Mrs Lucy Packer Linderman; and his will bequeathed $1,500,000 as an endowment for the university and $500,000 to the university library, and gave the university an interest (nearly one third) in his estate when finally distributed. He died in Philadelphia on the 17th of May 1879. The Packer Memorial Church (Protestant Episcopal) on the Lehigh University campus, given by his daughter, Mrs Mary Packer Cummings, was dedicated on the 13th of October 1887.

PACORUS, a Parthian name, borne by two Parthian princes.

1. PACORUS, son of Orodus I., was, after the battle of Carrhae, sent by his father into Syria at the head of an army in 52 B.C. The prince was still very young, and the real leader was Osaces. He was defeated and killed by C. Cassius, and soon after Pacorus was recalled by his father, because one of the satraps had rebelled and proclaimed him king (Dio Cass. xii. 28 sqq.; Justini. xiiii. 4; cf. Cicero, ad Fam. xv. 1; ad Att. vi. i. 14). Father and son were reconciled, but the war against the Romans was always deferred. In the autumn of 45 Pacorus and the Arabic chieftain Alchadonius came to the help of Q. Caecilius Bassus, who had rebelled against Caesar in Syria; but Pacorus soon returned, as his troops were unable to operate in the winter (Cic. ad Att. xiv. 9; 3; Dio Cass. xlvii. 27). At last in 40 B.C. the Roman fugitive Titus Labienus induced Orodus to send a great army under the command of Pacorus against the Roman provinces. Pacorus was in contact with whole of Syria and Phoenicia, with the exception of Tyre, and invaded Palestine, where he plundered Jerusalem, deposed Hyrcanus, and made his nephew Antigonus king (Dio Cass. xlviii. 24 sqq.; Joseph. Ant. xiv. 13; Tac. Hist. v. 9). Meanwhile Labienus occupied Cilicia and the southern parts of Asia Minor down to the Cariian coast (Dio Cass. xlviii. 26; Strabo xiv. 660). But in 39 P. Ventidius Bassus, the general of Mark Antony, drove him back into Cilicia, where he was killed, defeated the Parthians in Syria (Dio Cass. xlviii. 39 sqq.) and at last beat Pacorus at Gindarus (in northern Syria), on the 9th of June 38, the anniversary of the battle of Carrhae. Pacorus himself was slain in the battle, which effectively stopped the Parthian conquests west of the Euphrates (Dio Cass. xlix. 19 sqq.; Justin xiiii. iv.; Plut. Anton. 24; Strabo xvi. 751; Velleius ii. 78; cf. Horace, Od. iii. 6, 9).

2. PACORUS, Parthian king, only mentioned by Dio Cass. 177; Arrian, ap. Suid. s.v. apoqrh, according to whom he sold the kingdom of Osroene to Abgar VII.; and Ammianus Marcellinus xxiii. 6, 23, who mentions that he enlarged Ctesiphon and built its walls. Dio Cass. xlviii. 18, 4, quotes a letter which Pacorus wrote to his grandson, to the effect that he was on the throne with interruptions, from a.D. 78-95. He always calls himself Arsaces Pacorus. This mention of his proper name, together with the royal name Arsaces, shows that his kingdom was disputed by rivals. Two of them we know from coins—Vologaeses II., who appears from 77-79 and again from 111-146, and Artabanus III. in 80 and 81. Pacorus may have died about 105; he was succeeded by his brother Osores. (Ed. M.)

PACUVIUS, MARCUS (c. 220-130 B.C.), Roman tragic poet, was the nephew and pupil of Ennius, by whom Roman tragedy was first raised to a position of influence and dignity. In the interval between the death of Ennius (169) and the advent of Accius, the youngest and most productive of the tragic poets, he alone maintained the continuity of the serious drama, and perpetuated the character first imparted to it by Ennius. Like Ennius he probably belonged to an Oscan stock, and was born at Brunundium, which had become a Roman colony in 244. Hence he never attained to that perfect idiomatic purity of style, which, with the special glory of the earliest stage of Naevius and Plautus, is such a distinguishing feature of Pacuvius. From his numerous dates, he is considered as a painter; and the elder Pliny (Nat. Hist. xxxv. 19) mentions a work of his in the temple of Hercules in the Forum Boarium. He was less productive as a poet than either Ennius or Accius; and we hear of only about twelve of his plays, founded on Greek subjects (among them the Antiope, Teucer, Armorum Judicium, Dulestes, Chryses, Niptra, &c., most of them on subjects connected with the Trojan cycle), and one praetexta (Paulus) written in connexion with the victory of Lucius Aemilius Paulus at Pydna (168), as the Clastidium of Naevius and the Ambracia of Ennius were written in commemoration of great military successes. He continued to write tragedies till the age of eighty, when he exhibited a play in the same year as Accius, who was then thirty years of age. He retired to Tarentum for the last years of his life, and a story is told by Gallius (xiii. 2) of his being visited there by Accius on his way to Asia, who read him Aresus to him. The story is probably, like that of the visit of the young Terence to the veteran Caecilius, due to the invention of later grammarians; but it is invented in accordance with the traditional criticism (Horace, Ep. ii. 1. 54-55) of the distinction between the two poets, the older being characterized rather by cultivated accomplishment (doctus), the younger by vigour and animation (altus). Pacuvius's epitaph, said to have been composed by himself, is quoted by Aulus Gallius (ii. 24), with a tribute of admiration to its "modesty, simplicity and fine serious spirit":

Adulescens, tam eam propeara, te hoc saxum rogat
Ut sese aspicias, deinde quod scriptum est legas.
Hic sunt poetae Pacuvii Marci sita.

Cicero, who frequently quotes from him with great admiration, appears (De optimo genere oratorum, i.) to rank him first among the Roman tragic poets, as Ennius among the epic, and Caecilius among the comic poets.

The fragments of Pacuvius quoted by Cicero in illustration or enforcement of his own ethical teaching, appeal, by the fortitude, dignity, and magnanimity of the sentiment expressed in them, to what was noblest in the Roman temperament. They are inspired also by a fervid and steadfast glow of spirit and reveal a gentleness and humanity of sentiment blended with the severe gravity of the original Roman character. So far too as the Romans were capable of taking interest in speculative questions, the tragic poets contributed to stimulate curiosity on such subjects, and they anticipated Lucretius in using the conclusions of speculative philosophy as well as of common sense to assuage some of the prevailing forms of superstition. Among the passages quoted from Pacuvius are several which indicate a taste both for physical and ethical speculation, and others which expose the pretensions of religious imposture. These poets aimed also in developing that capacity which the Roman language subsequently displayed of being an organ of oratory, history and moral disquisition. The literary language of Rome was in process of formation during the 2nd century B.C., and it was in the latter part of this century that the series of great Roman orators, with whose spirit Roman tragedy has a strong affinity, begins. But the new creative effort in language was accompanied by considerable crudeness of execution, and the novel word-formations and varieties of inflexion introduced by Pacuvius exposed him to the ridicule of the satirist Lucilius, and, long afterwards, to that of his imitator Persius. But, notwithstanding the attempt to introduce an alien element into the Roman language, which proved incompatible with its natural genius, and his own failure to attain the idiomatic purity of Naevius, Plautus or Terence, the fragments of his dramas are sufficient to prove the service which he rendered to the formation of the Roman literary language, as well as to the culture and character of his contemporaries.

Fragments in O. Ribbeck, Fragmenta scenaicae romanorum poesis (1897), vol. ii.; see also his Römische Tragödie (1875); L. Müller, De Pacuvii fabulis (1889); W. S. Teuffel, Caecilii Status, Pacuvius, Atius, Afranius (1858); and Mommsen, History of Rome, bk. iv. ch. 13.

PAD. (1) Probably from the same root as "pod," the husk or covered-covering in certain plants, a term used in various connections, the name being derived from that of a soft cushion, or cushion-like combination used either for protective purposes or as stuffing or stiffening. In zoology, it is particularly used of the fleshy elastic protuberances on the sole of the foot of many animals such as the cat and dog, the camel, &c., and of the similar cushion beneath the toes of a bird's foot or of the tarsal cushion of an insect. In sporting phraseology the whole paw of a fox or other beast of Chase is called the "pad." A special technical use, somewhat difficult to connect with the above meanings, is
for the socket of a brace or for the handle of such tools as a keyhole saw. (2) The canting word "pad," now surviving in such words as "footpad," "highway-robber," or "pad horse," a roadster riding horse with an easy action, is the same as "path," adapted directly from the Low Ger. form pad, a track or road. (3) There is an Old English dialect word for a frog (Scottish and North) or a toad, more familiar in the diminutive "paddock" (cf. Hamlet, iii. 4, 189; Macbeth, i. 1, g). This is found in many Teutonic languages, cf. Dan. paddle, Du. pad, &c. The diminutive is to be distinguished from "paddock," a small enclosed plot of pasture land, an altered form of "parrock," O. Eng. pærroc. (See Park.)

PADDING, the term in textile manufacture used for the stiffening of various garments. The most useful and flexible material for this purpose is hair cloth, but this is too expensive to be used for the padding of cheap clothing. Hence many kinds of fibrous material are employed for the same purpose. Hair, cotton, flax, tow, jute and paper are used, alone and in combination. The fabrics are first woven, and then starched to obtain the necessary degree of stiffness and flexibility.

PADDDINGTON, a municipality of Cumberland county, New South Wales, Australia, 3 m. S.E. of and suburban to Sydney. It is a busy industrial suburb, devoted to brewing, tanning, soap-boiling and various other manufactures. The town hall is one of the finest in the colony, and there is an excellent free library. Paddington returns one member to parliament. Pop. (1901), 22,034.

PADDDINGTON, a north-western metropolitan borough of London, England, bounded E. by Hampstead and Marylebone, S. by the city of Westminster, and W. by Kensingtont, and extending N. to the boundary of the county of London. Pop. (1901), 143,976. The best houses are found in the streets and squares of Bayswater, in the south-west, adjoining to Kensington Gardens (a small part of which is in the borough) and to Hyde Park, farther east, wherein seem to be a "north-east are broad-bladed" or "mansion house" of regimental flats on Harrow, the Harrow Road, skirts the park and gardens, forms part of the southern boundary of the borough; Edgware Road forms the eastern; from this Harrow Road branches north-west, Bishop's Road and Westbourne Grove form a thoroughfare westward, and Queen's Road, Bayswater, leads south from there to Bayswater Road. The name of Paddington finds no place in Domesday—it may have been included in the manor of Tyburn—and the land belonged to the Abbey of Westminster at an early date. It was granted to the see of London by Edward VI. In the 18th century the picturesque rural scenery attracted artists, and even in the middle of the 19th the open country was reached within the confines of the present borough, which now contains no traces of antiquity. Bayswater is said to take its name from Baynard, a Norman, who after the Conquest held land here and had a castle by the Thames not far above the Tower of London, whence a ward of the city is called Castle Baynard. Many springs flowed forth here; the stream called Westbourne was near at hand, and water was formerly supplied hence. In the borough are the Paddington and the Queen's Park technical institutes; St. Mary's Hospital, Praid Street, with medical school; and Paddington Green children's hospital. The terminus of the Great Western railway, facing Praid Street, is called Paddington Station. The parliamentary borough of Paddington has north and south divisions, each returning one member. The borough council consists of a mayor, 10 aldermen and 60 councillors. Area, 1356-1 acres.

PADDLE. (1) A verb, meaning to splash, dabble or play about in water with the feet or hands. (2) A species of oar, with a broad flat blade and short handle, used without a rowlock for propelling canoes or other lightly-built craft (see Canoe). (3) A small spade-like implement, apparently first used to clear a ploughshare from clods of earth. The verb seems to be a frequentative form of "pad," to walk, cognate with "path," or of "pat," to strike gently, an onomatopoeic word; it may have been influenced by the Fr. patrouiller, in much the same sense. The verb may have given rise to "paddle," an oar, an easy transition in sense; but the New English Dictionary identifies this with the word for a small spade, which occurs earlier than the verb, and seems to have no connexion in sense with it. The implement was known in the 17th and 18th centuries also as "spaddle," a diminutive of "spade," but "paddle" occurs in this sense as early as 1407. The term "paddle" has been applied to many objects and implements resembling the oar in its broad-bladed end: e.g. a shovel used in mixing materials in glass-making, in brick-making, &c., and also to the float-boards in the paddle-wheel of a steamboat or the wheel of a water-mill.

PADERBORN (Lat. Paderae Fontes, i.e. the springs of the Pader), a town and episcopal see of Germany, in the Prussian province of Westphalia, 63 m. N.E. from Dortmund on the railway to Berlin via Altenbeken. Pop. (1903), 26,498, of whom about 80% are Roman Catholics. It derives its name from the springs of the Pader, a small affluent of the Lippe, which rise in the town under the cathedral to the number of nearly 200, and with such force as to drive several mills within a few yards of their source. A large part of the town has been rebuilt since a great fire of 1875. The most prominent of half-a-dozen churches is the Roman Catholic cathedral, the western part of which dates from the 11th, the central part from the 12th, and the eastern part from the 13th century; it was restored in 1891-1893. Among other treasures it contains the silver coffin of St Liborius, a substitute for one which was coined into dollars in 1622 by Christian of Brunswick, the celebrated freebooter. The chapel of St Bartholomew, although externally insignificant, dates from the earlier part of the 11th century, and is counted among the most interesting buildings in Westphalia; it was restored in 1852. The Jesuit church and the Protestant Abdinghofkirche are also interesting. The town hall is a picturesque edifice of the 13th century; it was partly rebuilt in the 16th, and was restored in the 19th century. Paderborn formerly possessed a university in 1614, devoted to the study of jurisprudence and philosophy, but this was closed in 1819. The manufactures of the town include railway plant, glass, soap, tobacco and beer; and there is a trade in grain, cattle, fruit and wool. Paderborn owes its early development to Charlemagne, who held a diet here in 777 and made it the seat of a bishop a few years later. The Saxons also held diets in the city, which about the year 1000 was surrounded with walls. It joined the Hanseatic League, obtained many of the privileges of a free Imperial town, and endeavoured to assert its independence of the bishop. The citizens gladly accepted the reformed doctrines, but the supremacy of the older faith was restored in 1604 by Bishop Theodore von Fürstenberg, who forcibly took possession of the city. It underwent the same fate at the hands of Christian of Brunswick during the Thirty Years' War. The bishopric of Paderborn formed part of the arch-diocese of Mainz, and its bishop became a prince of the empire about 1100. Some of the bishoprics west of great activity, and the bishopric attained a certain measure of importance in North Germany, in spite of ravages during the Thirty Years' War and the Seven Years' War. It was secularized in 1803 and was given to Prussia, and after losing it for a few years that country regained it by the settlement of 1815. The last bishop was Franz Egon von Fürstenberg (d. 1835). The bishopric had an area of nearly 1000 sq. m. and a population of about 100,000. A new bishopric of Paderborn, with ecclesiastical authority only, was established in 1821.

See W. Richter, Geschichte der Stadt Paderborn (Paderborn, 1890-93); A. Hübinger, Die Verfassung der Stadt Paderborn im Mittelalter (Münster, 1899); and J. Freisen, Die Universität Paderborn (Paderborn, 1898). For the history of the bishopric see W. F. Giefers, Die Anfänge des Bistums Paderborn (Paderborn, 1860); L. A. T. Holscher, Die ältere Diöcese Paderborn (Paderborn, 1896); the Urinkunden des Bistums Paderborn, edited by R. Wilmans (Münster, 1876-1880), and W. Richter, Studien und Quellen zur Paderborner Geschichte (Paderborn, 1893).

PADEREWSKI, IGNACE JAN (1860— ), Polish pianist and composer, was born in Podolia, a province of Russian Poland. He studied music chiefly at Warsaw, Berli
Vienna, where he was a pupil of Theodor Leschetizky (b. 1830), the pianist and composer. He made his first public appearance in Vienna in 1887, in Paris in 1889, and in London in 1890, his brilliant playing created a furor which went to almost extravagant lengths of admiration; and his triumphs were repeated in America in 1891. His name at once became synonymous with the highest pitch of pianoforte playing, and society was at his feet. In 1890 he married Baroness de Rosen, and after 1900 he appeared but little in public; but he became better known as a composer, chiefly of pieces for his own instrument. In 1901 his opera *Manru* was performed at Dresden.

**PADIHAM**, an urban district in the Clitheroe parliamentary division of Lancashire, England, 3 m. W. of Burnley by the Lancashire and Yorkshire railway. Pop. (1901), 12,205. It lies in a wild and dreary district on the precipitous banks of the Calder. It possesses large cotton mills, and quarries and coal-mines are worked in the immediate neighbourhood. The church of St Leonard, founded before 1451, was frequently altered before it was rebuilt in 1866-1868 in the Perpendicular style. Padiham in 1551 was a manor in the possession of Edmund de Lacy.

**PADDILLA, JUAN LOPEZ DE**, insurrectionary leader in the "guerra de las comunidades" in which the commons of Castile made a futile stand against the arbitrary policy of Charles V. and his Flemish ministers, was the eldest son of the commendant of Castile, and was born in Toledo towards the close of the 15th century. After the cities, by their deputies assembled at Avila, had vainly demanded the king's return, due regard for the rights of the cortes, and economical administration, to be entrusted to the hands of Spaniards, it was resolved to resort to force, and the "holy junta" was formed, with Padilla at its head. An attempt was first made to establish a national government in the name of the imbecile Joanna, who was then reigning at Tordesillas; but this view they took possession of the person, seized the city, and after the latter's murder seized of the kingdom, and stripped Adrian of his regency. But the junta soon alienated the nobility by the boldness with which it asserted democracy and total abolition of privilege, while it courted defeat in the field by appointing to the supreme command of its forces not Padilla but Don Pedro de Giron, who had no recommendation but his high birth. After the army of the nobility had recaptured Tordesillas, Padilla did something to retrieve the loss by taking Torrelobatone and some other towns. But the junta, which was not fully in accord with its ablest leader, neutralized this advantage by granting an armistice; when hostilities were resumed the commons were completely defeated near Villalar (April 23, 1521), and Padilla, who had been taken prisoner, was publicly executed on the following day. His wife, Doña María Pacheco de Padilla, bravely defended Toledo against the royal troops for six months afterwards, but ultimately was compelled to take refuge in Portugal.

**PADISHAH**, the Turkish form of the Persian *padshah*, a title—equivalent to "lord king"—of the reigning sovereign. Though strictly applied in the East to the shahs of Persia, it was also used of the Great Moguls or Tatar emperors of Delhi, and hence it is now used by the natives of British India of the British sovereign as emperor of India. In Europe it is applied to the sultan of Turkey. The Persian *padshah* is from *paš*, lord, master, and *shah*, king. It is now generally considered to have no etymological connexion with "pasha" (**q.v.**).

**PADSTOW**, a small seaport and market town in the St Austell parliamentary division of Cornwall, England, on a branch of the London & South Western railway. Pop. of urban district (1901), 17,228. It lies near the north coast, on the west shore, and 1 m. from the mouth of the estuary of the river Camel, a picturesque inlet which from Padstow Bay penetrates 6 m. into the land. The church of St Petrock, with a massive roadstone in the churchyard, is mainly Perpendicular, with an Early English tower. Within are an ancient font, a canopied piscina, and a fine timber roof over the nave and aisles. Other interesting churches in the locality are those of St Petrock Minor, St Minver, St Michael, St Constantine, and, most remarkable of all, St Enodock's. This building, erected in the 15th century amid the barren dunes bordering the east shore of the estuary near its mouth, in place of a more ancient oratory, was long buried beneath drifts of sand. From a little distance only the weather-beaten spire can be seen. A Norman font remains from the older foundation. A monastery formerly stood on the high ground west of Padstow, and according to tradition was founded by St Petrock in the 6th and razed by the Danes in the 10th century. Its site is occupied by Prideaux Place, an Elizabethan mansion, which contains among other valuable pictures Van Dyck's portrait of Queen Henrietta Maria. Pentine Point shelters Padstow Bay on the north-east, but the approach to the estuary is dangerous during north-westerly gales. Padstow, nevertheless, is a valuable harbour of refuge, although the river channel is narrow and much silted. Drifting, however, is prosecuted, the sand being sent inland, being useful as a manure through the carbonate of lime with which it is impregnated. The Padstow Harbour Association (1829) is devoted to the rescue of ships in distress, making no claims for salvage beyond the sums necessary for its maintenance. Padstow has fisheries and shipyards and some agricultural trade.

Padstow (Aldestowe 1273, Patrikstowe 1326, Patrestowe 1346) and St Ives are the only two tolerably safe harbours on the north coast of Cornwall. To this circumstance they both owed their selection for early settlement. St Petrock, who has been called the patron saint of Cornwall, is said to have landed here and also to have died here in the 6th century. At the time of the Domesday survey Bodmin, which treasured the saint's remains, had become the chief centre of religious influence. Padstow is not mentioned in that record. It was included in the manor of Lostwithiel and was placed at a very early date under the see of Crediton upon its formation by Edward the Elder in 909. Padstow was plundered by the Danes in 981. Until then it is said to have possessed a monastery, which thereupon was transferred to Bodmin. Two manors of Padstow are mentioned later—the prior of Bodmin's manor, which included the rectory, and a manor which passed from the Bonvilles to the Greys, marquesses of Dorset, both of which were eventually acquired by the family of Prideaux. From the letters patent addressed to the bailiffs of Padstow demanding the survey and delivery of ships for foreign service, the appointment of a king's butler for the port, and the frequent recourse which was had to the king's courts for the settlement of disputes of shipping, Padstow appears to have been a port of considerable repute in the 14th century. Its affairs were entrusted to a reeve or bailiff acting in conjunction with the principal men of the town. In 1540 Leland, without sufficient reason, credits Athelstan with the donation of sum's privileges as it then enjoyed, and describes it as a parish full of fisherfolk and Irishmen. Forty years later Norden describes it as an incorporation and market town. Carew in 1602 states that it had lately purchased a corporation and derived great profit from its trade with Ireland. Some steps towards incorporation were doubtless taken, but it is remarkable that no traces of its municipal character are discoverable in any subsequent records. A prescriptive market is held on Saturdays; two fairs of like nature have disappeared.

**PADUA** (Lat. *Patavium*; Ital. *Padova*), a city of northern Italy, on the river Bacchiglione, 25 m. W. of Venice and 18 m. S.E. of Vicenza, with a population of 82,283. The city is picturesque, with arcaded streets, and many bridges crossing the various branches of the Bacchiglione, which once surrounded the ancient walls. The Palazzo della Ragione, with its great hall on the upper floor, is reputed to have the largest roof unsupported by columns in Europe; its length is nearly rectangular, its length 267 ft., its breadth 89 ft., and its height 78 ft.; the walls are covered with symbolic paintings in fresco; the building stands upon arches, and the upper storey is surrounded by an open loggia, not unlike that which surrounds the basilica of
Vicenza; the Palazzo was begun in 1372 and finished in 1380; in 1306, Fra Giovanni, an Augustinian friar, covered the whole with one roof; originally there were three roofs, spanning the three chambers into which the hall was at first divided; the internal partition walls remained till the fire of 1426, when the Venetian architects undertook the restoration. The building was thrown into one and forming the present great hall. In the Piazza dei Signori is the beautiful loggia called the Gran Guardia, begun in 1403 and finished in 1526, and close by is the Palazzo del Capitanio, the residence of the Venetian governors, with its great door, the work of Falconetto of Verona, 1532. The most famous of the Paduan churches is the basilica dedicated to Saint Anthony, commonly called Il Santo; the bones of the saint rest in a chapel richly ornamented with carved marbles, the work of various artists, among them of Sansovino and Falconetto; the basilica was begun about the year 1230 and completed in the following century; tradition says that the building was designed by Niccola Pisano; it is covered by seven cupolas, two of them pyramidal. On the piazza in front of the church is Donato's magnificent equestrian statue of Erasmo da Narni, the Venetian general (1438–1441). The Eremitani is an Augustinian church of the 13th century, distinguished as containing the tombs of Jacopo (1324) and Ubertino (1345) da Carrara, lords of Padua, and for the chapel of SS. James and Christopher, illustrated by Mantegna's frescoes. Close by the Eremitani is the small church of the Annunziata, known as the Madonna dell'Arena, whose inner walls are entirely covered with paintings by Giotto. Padua has long been famous for its university, founded by Frederick II. in 1238. Under the rule of Venice the university was governed by a board of three patricians, called the Riformatori dello Studio di Padova. The list of professors and alumni is long and illustrious, containing, among others, the names of Bezzo, Spione Spenos, Veselus, Acquapendente, Galileo, Pomponazzi, Pool, Scaliger, Tasso, and Sobieski. The place of Padua in the history of art is nearly equal to that of Florence; the presence of the university attracted many distinguished artists, as Giotto, Lippo Lippi and Donatello; and for native art there was the school of Squarcione (1394–1474), whence issued the great Mantegna (1431–1566). The industry of Padua has greatly developed in modern times. Corn and saw mills, distilleries, chemical factories, breweries, candle-works, ink-works, foundries, agricultural machine and automobile works, have been established and are flourishing. The trade of the district has grown to such an extent that Padua has become the central market for the whole of Venetia.

Padua claims to be the oldest city in north Italy; the inhabitants pretend to a fabulous descent from the Trojan Antenor, whose relics they recognized in a large stone sarcophagus exhumed in the year 1274. Their real origin is involved in that obscurity which conceals the ethnography of the earliest settlers in the Venetian plain. Padua early became a populous and thriving city, that to its excellent breed of horses and the wool of its sheep. Its men fought for the Romans at Cannae, and the city became so powerful that it was reported able to raise two hundred thousand fighting men. Abano in the neighbourhood was made illustrious by the birth of Livy, and Padua was the native place of Valerius Flaccus, Asconius Pedianus and Thrasea Paetus. Padua, in common with north-eastern Italy, suffered severely from the invasion of the Huns under Attila (452). It then passed under the Gothic kings Odoacer and Theodoric, but made submission to the Greeks in 490. The city was seized by the Goths under Totila, and again restored to the Eastern Empire by Narses in 588. Following the course of events common to most cities of north-eastern Italy, the history of Padua falls under eight heads: (1) the Lombard rule, (2) the Frankish rule, (3) the period of the bishops, (4) the emergence of the commune, (5) the period of the despot, (6) the period of Venetian supremacy, (7) the period of Austria, and finally (8) the period of united Italy. (1) Under the Lombards the city of Padua rose in revolt (691) against Agilulf, the Lombard king, and after suffering a long and bloody siege was stormed and burned by him. The city did not easily recover from this blow, and Padua was still weak when the Franks succeeded the Lombards as masters of north Italy. (2) At the Diet of Aix-la-Chapelle (828) the duchy of Friuli, in which Padua lay, was divided into four counties, one of which took its title from that city. (3) During the period of Episcopal supremacy Padua does not appear to have been either very important or very active. The general tendency of its policy throughout the war of investitures was Imperial and not Roman; and its bishops were, for the most part, Germans. (4) But under the surface two important movements were taking place. At the beginning of the 11th century the citizens established a constitution, composed of a general council or legislative assembly and a cedrenza or executive; and during the next century they were engaged in wars with Venice and Vicenza for the right of water-way on the Bacchiglione and the Brenta—so that, on the one hand, the city grew in power and self-reliance, while, on the other, the great families of Camposampiero, D'Este and Da Romano began to emerge and to divide the Paduan district between them. The citizens, in order to protect their liberties, were obliged to elect a podesta, and their choice fell first on one of the D'Este family (c. 1175). The temporary success of the Lombard league helped to strengthen the towns; but their ineradicable jealousy of another soon reduced them to weakness again, so that in 1236 Frederick II. found little difficulty in establishing his vicar Ezzelino da Romano in Padua and the neighbouring cities, where he practised frightful cruelties on the inhabitants. When Ezzelino met his death, in 1259, Padua enjoyed a brief period of rest and prosperity: the university flourished; the basilica of the saint was begun; the Paduans became masters of Vicenza. But this advance brought them into dangerous proximity to Can Grande della Scala, lord of Verona, to whom they yielded in 1311. (5) As a reward for freeing the city from the Scalas, Jacopo da Carrara was elected lord of Padua in 1318. From that date to 1355, when Gian Galeazzo Visconti held the town, nine members of the Carrara family succeeded one another as lords of the city. It was a long period of restlessness, for the Carrarese were constantly at war; they were finally extinguished between the growing power of the Visconti and of Venice. (6) Padua passed under Venetian rule in 1405, and so remained, with a brief interval during the wars of the League of Cambrai, till the fall of the republic in 1797. The city was governed by two Venetian nobles, a podesta for civil and a captain for military affairs; each of these was elected for sixteen months. Under these governors the great and small councils continued to discharge municipal business and to administer the Paduan law, contained in the statutes of 1276 and 1362. The treasury was managed by two chamberlains; and every five years the Paduans sent one of their nobles to reside as nuncio in Venice, and to watch the interests of his city (1412). (7) After the fall of the Venetian republic the history of Padua follows the history of Venice during the periods of French and Austrian supremacy. In 1866 the battle of Königgratz gave Italy the opportunity to shake off the last of the Austrian yoke, when Venetia, and with Venetia Padua, became part of the United Italian kingdom. Padua, a city and the county-seat of McCracken county, Kentucky, U.S.A., at the confluence of the Tennessee river with the Ohio, about 12 m. below the mouth of the Cumberland, and about 50 m. E. by N. of Cairo, Illinois. Pop. (1890), 12,792; (1900), 19,446, of whom 3814 were negroes and 516 were foreign born; (1010 census) 22,766. It is served by three branches of
the Illinois Central railroad by a branch of the Nashville Chattanooga & St Louis railway (of which it is the terminus), and by steamboat lines to Pittsburg, Louisville, St. Louis, New Orleans, Nashville, Chattanooga, and other river ports. Paducah is in a rich agricultural region, and its wholesale trade is probably greater than that of any other city of the state except Louisville. Its trade is largely in groceries, whisky, tobacco, hardware, grain and live stock, vegetables and lumber. It is a large loose-leaf tobacco market, and is a headquarters for tow boats carrying coal down the Mississippi. The Illinois Central and the Nashville, Chattanooga & St Louis railways have repair shops here; and there are numerous manufactures,—the value of the factory products increasing from $5,976,031 in 1900 to $4,443,232 in 1905, or 49.3%. Paducah (said to have been named in honour of an Indian chief who lived in the vicinity and of whom there is a statue in the city) was settled in 1821, was laid out in 1827, was incorporated as a town in 1830, and was chartered as a city in 1856. The city was occupied by General U. S. Grant the 5th of September 1861; on the 25th of March 1864 it entered by a Confederate force under General Nathan B. Forrest, who, however, was unable to capture the fortifications and immediately withdrew.

PAEAN (Gr. Παίαν, epic Παηαγών), in Homer (Il. v. 401, 890), the physician of the gods. In other writers the word is a mere epithet of Apollo (q.v.) in his capacity as a god of healing (cf. λαρνάμαρις οἴνοιος), but it is not known whether Paean was originally a separate deity or merely an aspect of Apollo. Homer leaves the question unanswered; Hesiod (cf. schol. Hom. Od. iv. 432) definitely separates the two, and in later poetry Paean is invoked independently as a health god. It is equally difficult to discover the relation between Paean or Paeon in the sense of "healer" and Paean in the sense of "song." Farnell refers to the ancient association between the healing craft and the singing of spells, and says that it is impossible to decide which is the original sense. At all events the meaning of "healer" gradually gave place to that of "hymn," from the phrase ἐκ Παίαιν, such songs were originally addressed to Apollo (cf. the Homeric Hymn to Apollo 277, and notes in ed. by Sikes and Allen), and afterwards to other gods, Dionysus, Helios, Asclepius. About the 4th century the paean became merely a formula of adulation; its object was either to implore protection against disease and misfortune, or to offer thanks after such protection had been rendered. Its connexion with Apollo as the slayer of the python led to its association with battle and victory; hence it became the custom for a paean to be sung by an army on the march and before entering into battle, when a fleet left the harbour, and also after a victory had been won. The most famous paeans are those of Bacchylides (q.v.) and Pindar (q.v.). Paean were sung at the festivals of Apollo (especially the Hyacinthia), at banquets, and later even at public funerals. In later times they were addressed not only to the gods, but to human beings. In this manner the Rhodians celebrated Polteme I. of Egypt, the Samians Lyssander of Sparta, the Athenians Demetrius, the Delphi, and the Macedons. The word "paean" is now used in the sense of any song of joy or triumph.

PAELIGNI, a people of ancient Italy, first mentioned as a member of a confederacy which included the Marsi, Marrucini and Vestini (qq.v.), with which the Romans came into conflict in the second Samnite War, 325 B.C. (Liv. viii. 29). On the submission of the Sammites they all came into alliance with Rome in 305-302 B.C. (Liv. iv. 45, x. 3, and Diod. xx. 101), the Paelignians having fought hard (Diod. xx. 90) against even this degree of subjection. Each of them was an independent unit, and in none was there any town or community politically separate from the tribe as a whole. Thus the Vestini issued coins in the 3rd century; each of them appears in the list of the allies in the Social War (Appian, B.C. i. 36, with J. Beloch, Der italische Bund unter römischer Hegemonie, p. 51). How purely Italian in sentiment these communities of the mountain country remained appears from the choice of the mountain fortress of Corinium as the rebel capital. It was renamed Vitellio, the Oscar form of the name which appears, written in Oscar alphabet, on the coins struck there in 30 B.C. (see R. S. Conway, The Italic Dialects, p. 216).

The inscriptions we possess are enough to show that the dialect spoken by these tribes was substantially the same from the northern boundary of the Frenani to some place in the upper Aternum valley not far from Amternum (mod. Aquila), and that this dialect closely resembled the Oscar of Lucania and Samnium, though presenting some peculiarities of its own, which warrant, perhaps, the use of the name North Oscar. The clearest of these is the use of postpositions, as in Vestine Poomune-n, "in templo Pomonalii"; prōtrim-e, i.e. in proximum, "on to what lies before you." Others are the sibilation of consonantal ð and the assimilation of -di- to some sound like that of English j (denoted by ð in the local variety of Latin alphabet), as in vidada, "vianda," i.e. "ad-viam"; Musæus=Lát. Massedua; and the loss of ð (in pronunciation) in the ablative, as in acta fratis fœtild (i.e. actae fratibus fœtild), where the contrast of the last with the other two forms shows that the ð was an archaism still occasionally used in writing. The last sentence of the interesting epigraph from which this phrase is taken may be quoted, as a specimen of the dialect; the stone was found in Pentima, the ancient Corinium, and the very perfect style of the Latin alphabet in which it is written shows that it cannot well be earlier than the last century B.C.: "Eīte uss prōtrime pacus, puus ecic lexé lifar," i.e. "ite vos porro pacati (cum bona pace), qui hoc scriptum (lisbar, 3rd decl. neut.) legistis." The form lese (2nd plur. perf. indic.) is closely parallel to the inflection of the same person in Sanskrit and of quite unique linguistic interest.

The name Paeligni may belong to the NO-class of Ethnica (see SABINII), but the difference that it has no vowel before the suffix suggests that it may rather be parallel with the suffix of Lat. prīgnīs. If it has any connexion with Lat. pāxes, "conquering," it is conceivable that it meant "half-breeds," and was a name coined in contempt by the conquering Sabines, who turned the tōnta Maronica into the community of the Marrucini (q.v.). But, when unsupported by direct evidence, even the most tempting etymology is an unsound guide. For the history of the Paeligni after 90 B.C. see the references given in C. I. L. ix. 290 (Salmo, esp. Ovid, e.g. Fasti, iv. 79, Amor. ii. 16; Florus ii. 9; Caes., B.C., i. 15) and 296 (Corinium, e.g. Diod. Sic. xxxvii. 2, 4, Caes., B.C., i. 15). None of the Latin inscriptions of the district need be older than Sulla, but some of them both in language and script show the style of his period (e.g. 3087, 3037); and, on the other hand, as several of the native inscriptions, which are all in the Latin alphabet, show the normal letters of the Ciceronian period, there is little doubt that, for religious and private purposes at least, the Paelignian dialect lasted down to the middle of the 1st century B.C.

Paelignian and this group of inscriptions generally form a most important link in the chain of the Italic dialects, as without them the transition from Oscar to Umbrian would be completely lost. The unique collection of inscriptions and antiquities of Pentima and the museum at Sulmona were both created by the late Professor Antonio de Nino, whose brilliant gifts and unsparking devotion to the antiquities of his native district rescued every single Paelignian monument that we possess.

For further details and the text of the inscriptions, the place-names, &c. see R. S. Conway, The Italic Dialects, pp. 325 sqq., and the earlier authorities there cited. (R. S. C.)

PAEONIA, in ancient geography, the land of the Paeontians, the boundaries of which, like the early history of its inhabitants, are very obscure. The Paontians are regarded as descendants of the Phrygians of Asia Minor, large numbers of whom in early times crossed over to Europe. According to the national legend (Herodotus v. 16), they were Teurician colonists from Troy, and Homer (Ulyss. ii. 848) speaks of Pacontians from the Arian fighting on the side of the Trojan kinsmen. Before the reign
of Darius Hystaspes, they had made their way as far east as Perinthus in Thrace on the Propontis. At one time all Mygdonia, together with Crestonicæ, was subject to them. When Xerxes crossed Chalcedıć on his way to Therisa (Thessalonica) he is said to have marched "through Paonian territory." They occupied the entire valley of the Axios (Vardar) as far inland as Stobi, the valleys to the east of it as far as the Strymon (Struma), and the country round Astibos and the river of the same name, with the water of which they anointed their kings. Emathia, the district between the Haliacmon (Bistrita) and Axios, was once called Paeonia, and Pitera and Pelagonia were inhabited by Paeonians. In consequence of the growth of Macedonian power, and under pressure from their Thracian neighbours, their territory was considerably diminished, and in historical times was limited to the N. of Macedonia from Illyria to the Strymon. The chief town and seat of the kings was Byalazora (Veles, Kuprolu on the Axios); in the Roman period, Stobi (Pustogradsko). The Paeonians included several independent tribes, all later united under the rule of a single king. Little is known of their manners and customs. They adopted the cult of Dionysus, known amongst them as Dyalus or Dryalus, and Herodotus (i. 33) mentions that the Thracian and Paeonian women offered sacrifice to Queen Artemis (probably Bendis). They worshipped the sun in the form of a small round disk fixed on the top of a pole. A passage in Athenaeus (i.x. p. 398) seems to indicate the affinity of their language with Mysian. They drank barley beer and various deccotions made from plants and herbs. The country was rich in gold and a bituminous kind of wood (or stone), which burst into a blaze when in contact with water called σωλο, (or σωλον). The women were famous for their industry. In this connexion Herodotus (v. 12) tells the story that Darius, having seen at Sardis a beautiful Paeonian woman carrying a pitcher on her head, leading a horse to drink, and spinning flax, all at the same time, inquired who she was. Having been informed that she was a Paeonian, he sent instructions to Megabyzus, commander in Thrace, to deport two tribes of the nation without delay to Asia. At the time of the Persian invasion, the Paeonians on the lower Strymon had lost, while those in the north maintained, their independence. They frequently rode inroads into Macedonian territory, until they were finally subdued by Philip, who permitted them to retain their government by kings. The daughter of Aureoneon, one of these kings, was the wife of Pyrrhus, king of Epirus, and Alexander the Great wished to bestow the hand of his sister Cynane upon Lagonas, who had shown himself loyal to Philip. An inscription, discovered in 1877 at Olympia on the base of a statue of a king, stated that it was set up by the community of the Paeonians in honour of their king and founder Driopon. Another king, whose name appears as Lyppeus on a fragment of an inscription found at Athens relating to a treaty of alliance is now no doubt identical with the Lyceus or Lyceus of Paeonian coins (see B. V. Head, Historia numorum, 1887, p. 207). In 280 the Gallic invaders under Brennus ravaged the land of the Paeonians, who, being further hard pressed by the Dardani, had no alternative but to join the Macedonians, whose downfall they shared. After the Roman conquest, Paeonia east and west of the Axios formed the second and third districts respectively of Macedonia (Livy xlv. 29). Under Diocletian Paonia and Pelagonia formed a province called Macedonia secunda or salutaris, belonging to the prefecture of Illyricum.

See W. Tomaseck, "Die alten Thraker," in Studienberichte der k. Akad. der Wissenschaften, xxviii. (Vienna, 1893); H. F. O. Abel, Mohadamoni vor König Philipp (Leipzig, 1847); C. O. Müller, Über die Wohnsitze, die Abstammung und die ältere Geschichte des macedonischen Paeonien (Münchener Beiträge zur Geschichte, 1883); T. Desch (period).""
an opera which obtained a wide popularity, and Le Monde (1844), based on the same story as Beethoven's Fidelio. In 1857 Napoleon while in Dresden took a fancy to him, and took him with him to Warsaw and Paris at a salary of 28,000 francs. In 1822 he succeeded Spontini as conductor of the Italian opera in Paris. This post he retained at the Restoration, receiving also the posts of director to the music and conductor of the private orchestra of the duke of Orleans. In 1823 he retired from the Italian opera in favour of Rossini. In 1831 he was elected a member of the Academy, and in 1832 was appointed director of his orchestra by King Louis Philippe. He died on the 3rd of May 1839.

Paër wrote in all 43 operas, in the Italian style of Paisello and Cimarosa. His other works, which include nine religious compositions, thirteen cantatas, and a short list of orchestral and chamber pieces, are of little importance; in any case the superficial quality of his compositions was such as to secure him popularity while he lived and after his death oblivion.

See R. Eitner, Quellen-Lexikon (Leipzig, 1902), viii, 277, sqq., where a list of his works is given.

PAESTUM (Gr. Παίστουμ; mod. Paesti, Ponto), an ancient Greek city in Lucania, near the sea, with a railway station 24 m. S.E. of Salerno. 5 m. S. of the river Saluce. It stands upon the site of a colony, a Tarantum; also (v. 448 BC) which was sacked by Sextus and Achaean colonists from the still older colony of Sybaris, on the Gulf of Tarentum; this probably happened not later than about 600 B.C.

Herodotus (i. 167) speaks of it as being already a flourishing city in about 540 B.C., when the neighbouring city of Velia was founded. For many years the city maintained its independence, though surrounded by the hostile native inhabitants of Lucania. Autonomous coins were struck, of which many specimens now exist (see NUMISMATICS). After long struggles the city fell into the hands of the Lucanians (who nevertheless did not expel the Greek colonists) and in 273 B.C. it became a Latin colony under the Roman rule, the name being changed to the Latin form Paestum. It successfully resisted the attacks of Hannibal, and it is noteworthy that it continued to strike copper coins even under Augustus and Tiberius. The neighbourhood was then healthy, highly cultivated, and celebrated for its flowers; the "twice blooming roses of Paestum" are mentioned by Virgil (Geor. iv. 118), Ovid (Met. x. 708), Martial (iv. 41, ro; vi. 80, 6), and other Latin poets. It is probable that the festival of the goddess of the flowers was probably owing to the silting up of the mouth of the Silarus, which has overflowed its bed, and converted the plain into unproductive marshy ground. Herds of buffaloes, and the few peasants who watch them, are now the only occupants of this once thickly populated and garden-like region. In 871 Paestum was sacked and partly destroyed by Saracen invaders; in the 11th century it was further dismantled by Robert Guiscard, and in the 16th century it was finally deserted.

The ruins of Posidonia are among the most interesting of the Hellenic world. The earliest temple in Paestum, the so-called Basilica, must in point of style be associated with the temples D and F at Selinus, and is therefore to be dated about 570-550 B.C. It is a building of unique plan, with nine columns in the front and eighteen at the sides, 43 ft. in diameter. A line of columns runs down the centre of the cella. The columns have marked entasis, and the fluting end in a semi-circle, above which is generally a torus (always present in the so-called temple of Ceres). The capitals are remarkable, inasmuch as the necking is immediately below the capital and not merely below the base. The columns are decorated with a band of leaves, the arrangement of which varies in different cases. The columns and the architraves upon them are well preserved, but there is nothing above the frieze existing, and the cella wall has entirely disappeared. Next in point of date comes the so-called temple of Ceres, a hexastyle peripteros, which may be dated about 540 B.C. The columns are all standing, and the west and part of the east pediment are still in situ; but of the cella, again, nothing is left. The capitals are like those of the Basilica, but the details are differently worked out. In front of this temple stood a sacrificial altar as long as the temple itself.

The most famous of the temples of Paestum, the so-called temple of Neptune, comes next in point of date (about 420 B.C.). It is a hexastyle peripteros with fourteen columns on each side, and is remarkably well-preserved, both pediments and the epistyle at the sides being still in situ. No traces of the decoration of the pediments and metopes have been preserved. The cella, the outer walls of which have to a great extent disappeared, has two internal rows of seven columns 4 1/2 ft. in diameter, upon which rests a simple epistyle, supporting a row of smaller columns, so that the interior of the cella was in two storeys.

The Temple of Peace is a building of the Roman period of the 2nd century B.C., with six Doric columns on the front, eight on the sides and none at the back; it was excavated in 1830 and is now entirely covered up. Traces of a Roman theatre and amphitheatre (?) have also been found. The circuit of the town walls, well built of squared blocks of travertine, and 16 ft. thick, of the Greek period, is almost entire; they are about 3 m. in circumference, enclosing an irregular, roughly rectangular area. There were four gates, on the east with a single arched opening being well-preserved. Outside the north gate is a street of tombs, in some of which were found arms, vases and fine mural paintings (now in the Naples Museum).

The following table gives the chief dimensions of the four temples described above in feet:—

(T. As.)

PAEZ, JOSÉ ANTONIO (1750-1873), Venezuelan president, was born of Indian parents near Carigua in the province of Barinas on the 13th of June 1790. He came to the front in the war of independence against Spain, and his military career, which began about 1810, was distinguished by the defeat of the Spanish forces at Mata de la Miel (1813), at Montecal and throughout the province of Apure (1816), and at Puerto Caballo (1823). In 1820 he furthered the secession of Venezuela from the republic of Colombia, and he became its first president (1826-1834). He was again president in 1835-1843, and dictator in 1846; but soon afterwards headed a revolution against his successor and was thrown into prison. In 1850 he was released and left the country, but in 1858 he returned, and in 1860 was made minister to the United States. A year after he again returned and made himself dictator, but in 1863 was overthrown and exiled. He died in New York on the 6th of May 1873.

His autobiography was published at New York in 1867-1869, and his son Ramon Paez wrote Public Life of J. A. Paez (1864). An Apotheosis by Guzman Blanco was published at Paris in 1889.

PAEZ, PEDRO (1564-1622), Jesuit missionary to Abyssinia, was born at Olmedo in Old Castile in 1564. Having entered the Society of Jesus, he was sent apart for foreign mission service, and sent to Goa in 1588. Within a year he and a fellow missionary were dispatched from that place to Abyssinia to act as spiritual director to the Portuguese residents. On his way thither, he fell into the hands of pirates at Dhofar and was sent to Sanaa, capital of the Yemen, where he was detailed
for seven years by the pasha as a slave. Having been redeemed by his order in 1596, he spent some years in mission work on the west coast of India, and it was not until 1603 that he again set out for Abyssinia, and landed at the port of Massawa. At the headquarters of his order, in Fremona, he soon acquired the two chief dialects of the country, translated a catechism, and set about the education of some Abyssinian children. He also established a reputation as a preacher, and having been summoned to court, succeeded in vanquishing the native priests and in converting Za-Denghel, the negus, who wrote to the pope and the king of Spain for more missionaries, an act of zeal which involved him in civil war with the Abyssinian priests (who dreaded the influence of Paez) and ultimately cost him his life (Oct. 1604). Paez, who is said to have been the first European to visit the source of the Blue Nile, died of fever in 1622.

PAGAN, a town and former capital, in Myingyan district, Upper Burma, 92 m. S.W. of Mandalay. It was founded by King Pyinbya in 847, and remained the capital until the extinction of the dynasty in 1298. Pagan itself is now a mere village, but hundreds of pagodas in various stages of decay meet the eye in every direction. The majority of them were built by King Anawrahta, who overcame the Peguan king, Manuha of Thaton. It was Anawrahta who introduced the Buddhist religion in Upper Burma, and who carried off nearly the whole Thaton population to build the pagodas at Pagan on the model of the Thaton originals. Many of these are of the highest architectural interest, besides being in themselves most imposing structures. Pagan is still a popular place of Buddhist pilgrimage, and a museum has been built for the exhibition of antiquities found in the neighbourhood. The population in 1901 was 6254.

PAGAN (Lat. paganus, of or belonging to a pagus, a canton, county, or district, village, commune), a heathen who worships a false god or false gods, or one who belongs to a race or nation which practices idolatrous rites and professes polytheism. In its early application paganus was applied by the Christian Church to those who refused to believe in the one true God, and still followed the Greek, Roman and other ancient faiths. It thus of course excluded Jews. In the middle ages, at the time of the crusades and later, "pagan" and "paganism" (O. Fr. paganisme, Lat. paganismus, heathenism or heathen lands) were particularly applied to Mahomedans, and sometimes to Jews. A special significance attaches to the word when applied to one who adopts an attitude of cultured indifference to, or negation of, the various heathen systems of religion which was taken by so many of the educated and aristocratic classes in the ancient Hellenic and Roman world.

It has long been accepted that the application of the name paganus, villager, to non-Christians was due to the fact that it was the common term among all old faiths limited. This explanation assumes that the use of paganus in this sense arose after the establishment of Christianity as the religion generally accepted in the urban as opposed to the rural districts, and it is usually stated that an edict of the emperor Valentinian of 368 dealing with the religio paganorum (Cod. Theod. xvi. 2) contains the first documentary use of the word in this secondary sense. It has now been shown that the use can be traced much earlier. Tertullian (c. 202; De corona militis, xi.), says "A pud hunc (Christum) tam miles est paganus fidelis quam paganus est miles infidelis." This gives the clue to the true explanation. In classical Latin paganus is frequently found in contradistinction to miles or armatus (cf. especially Tac. Hist. i. 53; ii. 14, 88; iii. 24, 43, 77), where the opposition is between a regular enrolled soldier and the raw half-armed rustics who sometimes formed a rude militia in Roman wars, or, more widely, between a soldier and a civilian. Thus the Christians who prided themselves on being "soldiers of Christ" (militia) could rightly term the non-Christians pagani. See also Gibbon, Decline and Fall of the Roman Empire (ed. Bury, 1866). ch. xxii. note ad fin.

PAGANINI, NICOLÒ (1782-1840), Italian virtuoso on the violin, was born at Genoa on the 18th of February 1782. His father Antonio, a clever amateur, who was in the shipping business, taught him the violin at a very early age, and he had further lessons from the maestro di cappella of the cathedral of San Lorenzo. He first appeared in public at Genoa in 1793, with triumphant success. In 1795 he visited Parma for the purpose of taking lessons from Alessandro Rolla, who, however, said that he had nothing to teach him. On returning home, he studied more diligently than ever, practising single passages for ten hours at a time, and publishing compositions so difficult that he alone could play them. His first professional tour, through the cities of Lombardy, was made with his father in 1797. For some years he led a chequered career; he gambled at cards, and had to pawn his violin; and between 1801 and 1804 he lived in retirement, in Tuscany, with a noble lady who was in love with him. In 1805 however he started on a tour through Europe, astonishing the world with his matchless performances, especially with his unaccompanied playing on the open string alone. The princess of Lucca and Piemno, Napoleon's sister, made him her musical director, and he became a prominent figure at the court where his caprices and audacities were a byword. He abandoned this in 1823, and visited Bologna, Milan, and other cities, gaining further fame by his extraordinary virtuosity. In Venice, in 1815, he began a liaison with Antonia Bianchi, a dancer, which lasted till 1828; and by her he had a son Achillino, born in 1826. Meanwhile the world rang with his praises. In 1827 the pope honoured him with the Order of the Golden Spur; and, in the following year, he extended his travels to Germany, beginning with Vienna, where he created a profound sensation. He first appeared in Paris in 1821, and on the 3rd of June in that year he played in London at the King's Theatre. His visit to England was preluded by the most romantic stories. He was described as a political victim who had been imprisoned for twenty years in a dungeon, where he played all day long an old broken violin with one string, and thus gained his wonderful mechanical dexterity. The result of this and other foolish reports was that he could not walk the streets without being mobbed. He charged what for that time were enormous fees; and his net profits in England alone, during his six years of absence from his own country, amounted to some £17,000. In 1832 he returned to Italy, and bought a villa near Parma. In 1833 he spent the winter in Paris, and in 1834 Berlioz composed for him his beautiful symphony, Harold in Itallie. He was that at the zenith of his fame; but his health, long since ruined by excessive study, declined rapidly. In 1838 he suffered serious losses in Paris through the failure of the "Casino Paganini," a gambling house which was refused a licence. The disasters of this year increased his malady—laryngeal phthisis—and, after much suffering, he died at Nice on the 17th of May 1840. He was debarred from the society of Achillino; and he bequeathed one of his violins, a fine Joseph Guarnerius, given him in early life by a kind French merchant, to the municipality of Genoa, who preserve it as one of their treasures. Paganini's style was impressive and passionate to the last degree. His cantabile passages moved his audience to tears, while his tours de force were so astonishing that a Viennese amateur publicly declared that he had seen the devil assisting him. His name stands in history as that of the most extraordinary executant ever known on the violin; and in spite of greater artists or no less remarkable later virtuosi, this reputation will remain with Paganini as the inaugurator of an epoch. He was the first to show what could be done by brilliance of technique, and his compositions were directed to that end. He was an undeniable genius, and it may be added that he behaved and looked like one, with his tall, emaciated figure and long black hair.

There are numerous lives of Paganini; see the article and bibliography in Grove's Dictionary of Music.
PAGE, THOMAS NELSON (1853– ), American author, was born at Oakland Plantation, Hanover county, Virginia, on the 23rd of April 1853, the great-grandson of Thomas Nelson (1725–1789) and of John Page (1744–1808), both governors of Virginia, the former being a signer of the Declaration of Independence. After a course at Washington and Lee University (1869–1872) he graduated in law at the University of Virginia (1874), and practised, chiefly in Richmond, until 1893, when he removed to Washington, D. C., and devoted himself to writing and lecturing. In 1884 he had published in the Century Magazine “Marse Chan,” a tale of life in Virginia during the Civil War, which immediately attracted attention. He wrote other stories of negro life and character (“Meh Lady,” “Unc’ Edmun’s Drowndin,” and “Ole ‘Strected”), which, with two others, were published in 1887 with the title In Ole Virginia, perhaps his most characteristic book. This was followed by Befo’ de War (1888), dialect poems, written with Armistead Churchill Gordon (b. 1853); On Newfound River (1895); The Old South (1891), social and political essays; Elisha and Other Stories (1892); The Burial of the Guns (1893); Postime Stories (1894); The Old Gentleman of the Black Stock (1895); Social Life in the South (1896); of the Red Rock (1898), a novel of the Reconstruction period; Gordon Keith (1901); The Negro: the Southerner’s Problem (1904); Bred in the Bone and Other Stories (1906); The Coast of Bohemia (1906), poems; The Old Dominion; Her Making and her Manners (1907), a collection of essays; Under the Crust (1907), stories; Robert E. Lee, the Southerner (1908); John Marshall, Assistant (1909), a novel; and various books for children. He is at his best in those short stories in which, through negro character and dialect, he pictures the life of the Virginia gentry, especially as it centred about the mutual devotion of master and servant.

PAGE, WILLIAM (1811–1885), American artist, was born at Albany, New York, on the 3rd of January 1811. He studied for the ministry at the Andover Theological Seminary in 1828–1830 and in later life became a Swedenborgian. He received his training in art from S. F. Morse and in the schools of the National Academy of Design, and in 1836 became a National Academician. From 1840 to 1860, he lived in Rome, where he painted portraits of his friends Robert and Elizabeth Bingham. The first collection of Lowell’s Poems (1843) was dedicated to Page, who was also a friend of W. W. Story. In 1871–1873 he was president of the National Academy of Design. He died at Tottenville, Staten Island, New York, on the 1st of October 1885. Besides numerous portraits he painted “Farragut at the Battle of Mobile,” belonging to the Tsar of Russia; a “Holy Family,” in the Boston Athenaeum; and “The Young Merchants,” at the Pennsylvania Academy of the Fine Arts, Philadelphia. He modelled and painted several portraits of Shakespeare, based on the Becker “death mask.” He wrote A New Geometrical Method of Measuring the Human Figure (1860).

PAGE. (1) A term used of a boy, lad or young male person in various capacities, positions or offices. The etymology is doubtful; the word is common to the Romance languages; cf. O. Fr. and Span. page, Port. pagem, Italg. paggio. The Med. Lat. pagis has been commonly referred to Gr. παγσ, diminutive of παῖς, boy, but the connexion is not so strongly deuced. Others refer the word to the παραπαγειογια, young slaves trained to become παγαγειο (Gr. παγεγογωγολ), or tutors to young boys attending school. Under the empire, numbers of such youths were attached to the imperial household for the purposes of ceremonial attendance on state occasions, thus occupying much the same position as that of the pages of a royal or noble household in medieval and modern times. In fact the term παραπαγειογια became equivalent to παραπαγειο, in palatio ministerio principis militabant (so Du Cange, Glossarium, s.v.). Littre refers pagios to pagensis, i.e. rustic, belonging to the country districts (pagus), and adduces from this the fact that the pagii were not necessarily boys or youths; and quotes from Claude Fauchet (1530–1601) the statement (Lib. I. Orig. militia. cap. i.) that up to the time of Charles VI. (1368–1429) and Charles VII. (1403–1461) “le mot de Page . . . sembloit être seulement donné à des viles personnes, comme à garsongs de pied.” Skeat (Ryym. Dict.) points out that the form of the word in Portuguese, pagem, indicates the derivation from pagensis. The word “page” was applied in English to a boy or youth who was employed as an assistant to an older servant, acting as it were as an apprentice and learning his duties. In present usage the chief applications are: (a) to a boy or lad, generally wearing livery, and sometimes styled a “buttons,” who is employed as a domestic servant; and (b) to a young boy who, dressed in fancy costume, forms part of the bridal procession at weddings. The word is also used (c) as the title of various officials of different rank in royal and other households; thus in the British royal household there are pages of honour, a page of the chambers, pages of the presence, and pages of the back stairs. These, no doubt, descend from the pueri paediogogiani of the Roman imperial household through the young persons of noble or gentle birth, who, during the middle and later ages, served in the household of royal and noble persons, and received a training to fit them for their future position in society. In the Church a “lady of the Holden” was one who served a knight and was trained to knighthood, and ranked next to a squire. (See KINNEIGHTH and VALET.)

(2) In the sense of one side of a leaf of printed or written matter, the word is derived through Fr. from Lat. pagina (pongere, to fasten).

PAGEANT, in its most general sense a show or spectacle; the more specific meanings are involved in the etymology of the word and its connexion with the history of the early mystery plays (see DRAMA). In its early forms, dating from the 14th century, the word was pagyn or pagen, the excrescent t or d, as in “tyrant,” “ancient,” not appearing till later. The Med. Lat. equivalent is pagina, and this, or at least the root from which it is formed, must be taken as the source. The senses, however, in which the word is used, viz. stage, platform, or scene played on a stage, are not those of the classical Lat. pagina, a page of a book, nor do they apparently occur in the medieval Latin of any language other than English. Further, it is not clear which meaning comes first, platform or scene. If the last, then “scene,” i.e. a division of the stage, is a later development of “page” of a book. If not, then pagina is a fresh formation from the root pag of ponegore, to fix or fasten, the word meaning a fastened framework of wood forming a stage or platform; cf. the classical use of compago, structure. Others take pagina as a translation of Gr. παγις, platform, stage, a word from the same root pag-. Du Cange (Glossarium) quotes a use in Med. Lat. of pega in this sense, Machiavelli in qua statuas collocabantur, and Cotgrave gives “Pegmae, a stage or frame whereon pageants be set or carried.”

As has been said, “pageant” is first found in the sense of a scene, a division or part of a play or of the platform on which such scene was played in the medieval drama. Thus we read of Queen Margaret in 1437 that at Coventry she saw “alle the pagentes pledye save domesday which myght be not playyd for lack of day,” and in the accounts of the Smiths’ geld at Coventry for 1450, five pence is paid “to bring the pagent into godfayr.” A clear idea of what these stages were like when the mystery plays became processional (procesus) that is, were acted on separate platforms moving along a street is seen in Archdeacon Roger’s contemporary account of the Chester plays about the end of the 16th century. “The make of these players were, every company had his pageant, or parte which pageants weare a high scaloide with 2 rowmes, a higher and a lower, upon 4 wheele” (T. Sharp, Dissertation on the Pageants or Mysteries at Coventry, 1825, which contains most of the early references to the word). The movable platform, filled with emblematic or allegorical figures, naturally played an important part in processional shows with no dialogue or dramatic action. An instance (1432) of the practice and the use of the word is found in the Monimentum gildhallae Londinensis (ed. Riley), “Parabant machina . . . in cujus medius stabat...”
PAGET, SIR JAMES

with one of his brothers a very careful Sketch of the Natural History of Yarmouth and its Neighbourhood. In October 1834 he entered as a student at St Bartholomew’s Hospital. Medical students in those days were left very much to themselves; there was no close supervision of their work, but it is probable that Paget gained rather than lost by having to fight his own way. He swept the board of prizes in 1835, and again in 1836; and in his first winter session he detected the presence of the Trichina spiralis, a minute parasite that infests the muscles of the human body.1 In May 1836 he passed his examination at the Royal College of Surgeons, and became qualified to practise. The next seven years (1836–1843) were spent in London lodgings, and were a time of poverty, for he made only £15 a year by practice, and his father, having failed in business, could not give him any help. He managed to keep himself by writing for the medical journals, and preparing the catalogues of the hospital museum and of the pathological museum of the Royal College of Surgeons. In 1836 he had been made curator of the hospital museum, and in 1838 demonstrator of morbid anatomy at the hospital; but his advancement there was hindered by the privileges of the hospital apprentices, and by the fact that he had been too poor to afford a house-surgeon, or even a dressership. In 1841 he was made surgeon to the Finsbury Dispensary; but this appointment did not give him any experience in the graver operations of surgery. In 1843 he was appointed lecturer on the gross and microscopic anatomy and physiology at the hospital, and warden of the hospital college that he founded.

For the next eight years he lived within the walls of the hospital, in charge of about thirty students resident in the little college. Besides his lectures and his superintendence of the resident students, he had to enter all new students, to advise them how to work, and to manage the finances and the general affairs of the school. Thus he was constantly occupied with the business of the school, and often passed a week, or more, without going outside the hospital gates. In 1844 he married Lydia, youngest daughter of the Rev. Henry North. In 1847 he was appointed an assistant-surgeon to the hospital, and Arris and Gale professor at the College of Surgeons. He held this professorship for six years and each year gave six lectures in surgical pathology. (The first edition of these lectures, which were the chief scientific work of his life, was published in 1853 as Lectures on Surgical Pathology.) In 1851 he was elected a Fellow of the Royal Society. In October 1851 he resigned the wardenship of the hospital. He had now become known as a great physiologist and pathologist: he had done for pathology in England what R. Virchow had done in Germany; but he had hardly begun to get into practice, and he had kept himself poor that he might pay his share of his father’s debts—a task that it took him fourteen years to fulfil.

It is probable that no famous surgeon, not even John Hunter, ever founded his practice deeper in science than Paget did, or waited longer for his work to come back to him. In physiology he had mastered the chief English, French, German, Dutch and Italian literature of the subject, and by incessant study and microscope work had put himself level with the most advanced knowledge of his time; so that it was said of him by R. Owen, in 1851, that he had his choice, either to be the first physiologist in Europe, or to have the first surgical practice in London, with a baronetcy. His physiological lectures at St Bartholomew’s Hospital were the chief cause of the rise in the fortunes of its school, which in 1843 had gone down to a low point. In pathology his work was even more important. He fills the place in pathology that had been left empty by Hunter’s death in 1793—the time of transition from Hunter’s teaching.

This discovery is usually credited to R. Owen (q.v.). The facts appear to have been as follows: the boy, who was a first-year student, and, by means of a pocket lens, found in the dissecting-room that the specks in the infected muscles were parasitic worms and not, as previously thought, spicules of bone. Thomas Wormald, the senior demonstrator, who was a distinguished surgeon, sent a piece of the same muscle to Owen, who authoritatively pronounced the specks to be parasites and gave them their scientific name. It is probable that Owen did not realize that Paget had already made the discovery, and it was naturally associated with the name of the professor.
which for all its greatness was hindered by want of the modern microscope, to the pathology and bacteriology of the present day. It is Paget's greatest achievement that he made pathology dependent, in everything, on the use of the microscope—especially the pathology of tumours. He and Virchow may truly be called the founders of modern pathology; they stand together, Paget's Lectures on Surgical Pathology and Virchow's Cellular-Pathologie. When Paget, in 1851, began practice near Cavendish Square, he had still to wait a few years more for success in professional life. The "turn of the tide" came about 1854 or 1855; and in 1858 he was appointed surgeon extraordinary to Queen Victoria, and in 1864 surgeon in ordinary to the prince of Wales. He had for many years the largest and most arduous surgical practice in London. His day's work was seldom less than sixteen or seventeen hours. Cases sent to him for final judgment, with special frequency, were those of tumours, and of all kinds of disease of the bones and joints, and all "neurotic" cases having symptoms of surgical disease. His supremacy lay rather in the science than in the art of surgery, but his name is associated also with certain great practical advances. He discovered the disease of the breast and the disease of the bones (eicne neoplasms) which are called after his name; and he was the first at the hospital to urge enucleation of the tumour, instead of amputation of the limb, in cases of myeloid sarcoma.

In 1871 he nearly died from infection at a post mortem examination, and, to lighten the weight of his work, was obliged to resign his surgery to the hospital. In this same year he received the honour of a baronetcy. In 1875 he was president of the Royal College of Surgeons, and in 1877 Hunterian orator. In 1878 he gave up operating, but for eight or ten years longer he still had a very heavy consulting practice. In 1881 he was president of the International Medical Congress held in London; in 1880 he gave, at Cambridge, a memorable address on "Elementary Pathology," setting forth the likeness of certain diseases of plants and trees to those of the human body. Besides shorter writings he also published Clinical Lectures and Essays (1st ed. 1875) and Studies of Old Case-books (1891). In 1883, on the death of Sir George Jessel, he was appointed vice-chancellor of the university of London. In 1889 he was appointed a member of the royal commission on vaccination. He died in London on the 30th of December 1890, in his eighty-fifth year. Sir James Paget had the gift of eloquence, and was one of the most careful and most delightful speakers of his time. He had a natural and unaffected pleasure in society, and he loved music. He possessed the rare gift of ability to turn swiftly from work to play; enjoying his holidays like a schoolboy, easily moved to laughter, keen to get the maximum of happiness out of very ordinary amusements, emotional in spite of incessant self-restraint, vigorous in spite of constant overwork. In him a certain light-hearted enjoyment was combined with the utmost reserve, unfailing religious faith, and the most scrupulous honour. He was all his life profoundly indifferent toward politics, both national and medical; his ideal was the unity of science and practice in the professional life.

**PAGET OF BEAudesert—PAGODA**

PAGODA (Port. pagode), a word introduced in the 16th century by the early Portuguese adventurers in India, reproducing phonetically some native word, possibly Pers. but-kadah, a house for an idol, or some form of Sansk. bhagavat, divine, holy), an Eastern term for a temple, especially a building of a pyramid shape common in India and the Far East and devoted to sacred purposes; in Buddhist countries, notably China, the name of a many-sided tower in which are kept holy relics. More loosely "pagoda" is used in the East to signify any non-Christian or non-Musulman place of worship. Pagoda or
pagod was also the name given to a gold (occasionally also silver) coin, of about the value of seven shillings, at one time current in southern India. From this meaning is derived the expression "the pagoda tree," as synonymous with the "wealth of the Indies," whence the phrase to "shake the pagoda tree." There is a real tree, the Plumeria acuminata, bearing the name. It grows in India, and is of a small and graceful shape, and bears yellow and white flowers tinged with red.

PAHARI (properly Pahārī, the language of the mountains), a general name applied to the Indo-Aryan languages or dialects spoken in the lower ranges of the Himalaya from Nepal in the east, to Chamba of the Punjab in the west. These forms of speech fall into three groups—ancient, consisting of the various dialects of Khas-kūra, the language of Nepal; a central, spoken in the north of the United Provinces, in Kumaon and Garhwal; and a western, spoken in the country round Simla and in Chamba. In Nepal, Khas-kūra is the language only of the Aryan population, the mother tongue of most of the inhabitants being some form or other of Tibeto-Burman speech (see TIBETO-BURMAN LANGUAGES), not Indo-Aryan. As may be expected, Khas-kūra is mainly differentiated from Central Pahari through its being affected, both in grammar and vocabulary, by Tibeto-Burman idioms. The speakers of Central and Western Pahari have not been brought into close association with Tibeto-Burmans, and their language is therefore purely Aryan.

Khas-kūra, as its speakers themselves call it, passes under various names. The English generally call it Nēpāli or Naipāli (i.e. the language of Nepal), which is a misnomer, for it is not the principal form of speech used in that country. Moreover, the Nepalese employ a corruption of this very word to indicate what is really the language of the country, viz. the Tibeto-Burman Nēwāri. Khas-kūra is also called Gōrkālī, or the language of the Gurkhas, and Pahārī or Parbatīyā, the language of the mountains. The number of speakers is not known, a census never having been taken of Nepal; but in British India 1,13,721 were recorded in the census of 1901, most of whom were soldiers in, or others connected with, the British Gurkha regiments.

Central Pahari includes three dialects—Garhawlī, spoken mainly in Garhwal and the country round the hill station of Mussorie; Jaunsārī, spoken in the Jaunsar tract of Dehra Dun; and Kumauni, spoken in Kumaun, including the country round the hill station of Nainī Tal. In 1901 the number of speakers was 1,279,931.

Western Pahari includes a great number of dialects. In the Simla Hill states alone no less than twenty-two, of which the most important are Sirmāuri and Kenōthāli (the dialect of Simla itself), were recorded at the last census. To these may be added Chamblāli and Churāli of the state of Chamba, Mandāli of the state of Mandī, Gādi of Chamba and Kangra, Kuli of Kulu and others. In 1901 the total number of speakers was 1,710,929.

The southern face of the Himalaya has from time immemorial been occupied by two classes of people. In the first place there is an Indo-Chinese overflow from Tibet in the north. Most of these tribes speak Indo-Chinese languages of the Tibeto-Burman family, while a few have abandoned their ancestral speech and now employ broken half-Aryan dialects. The other class consists of the great tribe of Khásas or Khasyās, Aryan in origin, the Kāraus of the Greek geographers. Who these people originally were, and how they entered India, are questions which have been more than once discussed without arriving at any very definite conclusion. 1 They are frequently mentioned in Sanskrit literature, were a thorn in the side of the rulers of Kashmir, and have occupied the lower Himalayas for many centuries. Nothing positive is known about their language, which they have long abandoned. Judging from the relics of it which appear in modern Pahari, it is probable that it belonged to the same group as Kashmiri, Lahuda and Sindhi. They have slowly moved from west to east, and are traditionally said to have reached Nepal in the early part of the 12th century A.D.

In the central and western Pahari tracts local traditions assert that from very early times there was constant communication with Rajputana and with the great kingdom of Kanaūj in the Gangetic Doab. A succession of immigrants, the tide of which was materially increased at a later period by the pressure of the Mussulman invasion of India, entered the country, and founded several dynasties, some of which survive to the present day. These Rajputs intermarried with the Khasa inhabitants of their new home, and gave their rank to the descendants of these mixed unions. With the pride of birth these new-born Rajputs inherited the language of their fathers, and thus the tongue of the ruling class, and subsequently of the whole population of this portion of the Himalaya, became a form of Rajasthani, the language spoken in distant Rajputana.

The Rajput occupation of Nepal is of later date. In the early part of the 16th century a number of Rajputs of Udaipur, in Rajputana, being oppressed by the Mussulmans, fled north and settled in Garhwal, Kumaon, and western Nepal. In A.D. 1550 a party of these conquered the small state of Gurkha, which lay about 70 m. north-west of Katmandu, the present capital of Nepal. In 1768 Prithwi Narayan Shah, the then Rajput ruler of Gurkha, made himself master of the whole of Nepal and founded the present Gurkha dynasty of that country. His successors extended their rule westwards over Kumaon and Garhwal, and as far as the Simla Hill states. The inhabitants of Nepal included not only Aryan Khāsas, but also, as has been said, a number of Tibeto-Burman tribes. The Rajputs of Gurkha could not impose their language upon these as they did upon the Khāsas, but, owing to its being the tongue of the ruling race, it ultimately became generally understood and employed as the lingua franca of this polyglot country. Although the language of the Khāsas has disappeared, the one is still numerically the most important Aryan one in this part of the Himalaya, and it hence gave its name to its newly adopted speech, which is at the present day locally known as "Khas-kūra."

In the manner described above the Aryan language of the whole Pahari area is now a form of Rajasthani, exhibiting at the same time traces of the old Khāsa language which it superseded, and also in Nepal of the Tibeto-Burman forms of speech by which it is surrounded. (For information regarding Rajasthani the reader is referred to the articles INDO-ARYAN LANGUAGES; FRANKIT; and GUJARATI.)

Khas-kūra shows most traces of Tibeto-Burman influence. The gender of nouns is purely sexual, and, although there is an oblique case derived from Rajasthani, it is so often confounded with the nominative, that in the singular number either can be employed for the other. Both these are due to Tibeto-Burman influence, but the non-Aryan idiom is most prominent in the use of the verb. There is an indefinite tense referring to present, past or future time according to the context, formed by suffixing the verb substantive to the root of the main verb, exactly as in some of the neighbouring Tibeto-Burman languages. There is no imperative but the con- 
jugation which reminds one strongly of Tibetan, and, in colloquial speech, in that tongue, the subject of any tense of a transitive verb is put into the agent case.

In Eastern and Central Pahari the verb substantive is formed from the root ach, as in both Rajasthani and Kashmiri. In Rajas-

Here we have a relic of the old Khāsa language, which, as has been said, seems to have been related to Kashmiri. Other relics of Khāsa,
again agreeing with north-western India, are the tendency to shorten long vowels, the practice of eponthesis, or the modification of a vowel by the one which follows in the next syllable, and the frequent occurrence of dissipation. Thus, Khus sāna, Kumanjī sāna, but Hāl is sāna, and Pahlavl, pāhāl (Aramaic)

Regarding Western Pahlavi materials are not so complete. The speakers are not brought into contact with Tibeto-Burman languages, and hence we find no trace of this. But the signs of the influence of north-western languages are, as might be expected, seen in the form of the dialects used by the Farther East. Sometimes it is called the Sindi bāš (see SINDH). At other times it is jō, where is here a locative of the base of the Sindi genitive postposition jō. In all Indo-Aryan languages, the genitive postposition is by the locative of the genitive one. In vocabulary, Western Pahlavi often employs, for the more common ideas, words which can most readily be connected with the north-western and Pāścāka.

(See INDO-ARYAN LANGUAGES.)

LITERATURE—Khaš-kura has a small literature which has grown up in recent years. We may mention the Būrsikka, an anonymous collection of folk-tales, and a Rāmāyana by Bānu Bhatta. There are also several translations from Sanskrit. Of late years local sek was not only the earliest and the most important of the Pahari literature. Especially is it owing to the work of the late A. D. B. Dunlop that the study of Central Pahlavi. Special mention may be made of Ganga Dutt Upreti's Proverbs and Folklore of Kumanjī and Garwāli (Lodiana, 1894); the same author's Dialects of the Kumanjī Division (Almorā, 1897); the late Jwala Dutt's Daśa Bumāda Carita (Almorā, 1892). A local poet who lived about a century ago, Gumānī Kavi by name, was the author of verses written in a peculiar style, and now much admired. Every verse consists of four lines, the first three being in Sanskrit, and the fourth a Hindi or Kumanjī proverb. A collection of these, by Rewa Dutt Upreti, was published in the Indian Antiquary for 1909 (pp. 177 seq.) under the title Gumānī-nātī. Western Pahlavi has its distinct literature, and, like that of the Bible, the latter is not complete, but the Khaš-kura (under the name of "Pahla") Kumanjī, Garwāli, Jains, Chambiali.

AUTHORITIES.—S. H. Kellogg's Hindi Grammar (2d ed., London, 1887) includes both Central and Western Pahlavi in its survey. For Khaš see also A. Turnbull, Nepali, i.e. Gorkhā or Parbate Grammar (Darjeeling, 1904), and C. A. Grierdon, "A Specimen of the Khas or Naḍālī Language," in the Zeitschrift der deutschen morgenländischen Gesellschaft (1907), lix. 659 seq. There is no authority dealing with Western Pahlavi as a whole. A. H. Dick's work, The Kulu Dialect of Hindi (Lahore, 1896), may be consulted for Kullu. See also T. Graham Bailey's Languages of the Northern Himalayas (Royal Asiatic Society, London, 1908). Vol. i. pt. iv. of the Linguistic Survey of India contains full particulars of all the Pahari dialects in great detail.

PAHLAVI, or PEALEV, the name given by the followers of Zoroaster to the character in which are written the ancient translations of their sacred books and some other works which they preserve (see PERSIA: Language). The name can be traced back for many centuries; the great epic poet Firdousī (second half of the 10th Christian century) repeatedly spoke of Pahlavi books as the sources of his narratives, and he tells us among other things that in the time of the first Khorosan (Choirosī, A.D. 531–570) the Pahlavi character alone was used in Persia.1 The learned Ibn Moḳafā (7th century) calls Pahlavi one of the languages of Persia, and seems to imply that it was an official language of the realm. Among his works, and among works on the language, were called Pahlavi before the Arab period. It is suitable to confine the word, as it is now generally done, to designate a kind of writing—not only that of the Pahlavi books, but of all inscriptions on stone and metal which use similar characters and are written essentially on the same principles as these books.

At first sight the Pahlavi books present the strangest spectacle of mixture of speech. Purely Semitic (Aramaic) words—and these not only nouns and verbs, but numerals, particles, demonstrative and even personal pronouns—stand side by side with Persian vocables. Often, however, the Semitic words are compounded in a way quite unsemitic, or have Persian terminations. As read by the modern Zoroastrians, there are also many words which are neither Semitic nor Persian; but it is soon seen that this traditional pronunciation is untrustworthy. We know that the character is curvilinear and very ambiguous, so that, for example, there is but one sign for  sû, š, and š, and for  y, i, and w, this has led to mistakes in the received pronunciation, which for many words can be shown to have been at one time more correct than it is now. But apart from such blunders there remain phenomena which could never have appeared in a real language; and the hot strife which raged till recently as to whether Pahlavi is Semitic or Persian has been closed by the discovery that it is merely a way of writing Persian in which the Persian words are partly—represented—to the eye, not to the ear—by their Semitic equivalents. This view, the development of which began with Westergaard (Zendavesta, p. 20, note), is in full accordance with the true and ancient tradition. Thus Ibn Moḳafā, who translated many Pahlavi books into Arabic, tells us that the Persians had about one thousand words which they wrote otherwise than they were pronounced in Persian.2 For example, he says they wrote luṭim, i.e. the Aramaic laḥmā, but they pronounced ṅām, which is the common Persian word for bread. Similarly Bera, the Aramaic besārā, flesh, was pronounced as the Persian gābā. We still possess a glossary which actually gives the Pahlavi writing with its Persian pronunciation. This glossary, which besides Aramaic words contains also a variety of Persian words disguised in antique forms, or by errors due to the contracted style of writing, exists in various shapes, all of which, in spite of their corruptions, go back to the work which the statement of Ibn Moḳafā had in view.3 Thus the Persians did the same thing on a much larger scale, as when in English we write f (libra) and pronounce "pound" or & (et) and pronounce "and." No system was followed in the choice of Semitic forms. Sometimes a noun was written in its status absolutus, sometimes the emphatic d was added, and this was written as s sometimes as n. One verb was written in the perfect, another in the imperfect. Even various dative forms were laid under contribution. The Semitic signs by which Persian synonyms were distinguished are sometimes quite arbitrary. Thus in Persian ḥūnak and ḥūsh both mean "self;": the former is written nafū hak (nafū ḥak)f the latter ṅūsh with the preposition bē prefixed. Personal pronouns are expressed in the dative (i.e. with prepositional l prefixed), thus l haka (tā) for tu, thōu, lnt (lan) for amā, "we." Sometimes the same Semitic sign stands for two distinct Persian words that happen to agree in sound; thus because ḡānā is Aramaic for "this," hūna represents not only Persian ē, "this," but also the intersection ē, i.e. " O " as prefixed to a vocative. Sometimes for clearness a Persian termination is added to a Semitic word; thus, to distinguish between the two words for father, pīt and pīlar, the former is written ab and the latter arīb. The Persian form is, however, not seldom used, even where there is a quite well-known Semitic locution.

These difficulties of reading mostly disappear when the ideographic nature of the writing is recognized. We do not always know what Semitic word supplied some ambiguous group of letters (e.g. pun for pa, "to," or hē for aga, "if"); but we can always tell the Persian word—which is the one important thing—though not always the exact pronunciation of it in that older stage of the language which the extant Pahlavi works belong to. In Pahlavi, for example, the word for "female" is written mātak, an ancient form which afterwards passed through mādak into mādā. But it was a mistake of later ages to fancy that because this was so the sign T also meant D,4 Fīhrīsī, p. 14, line 13 seq., cf. line 4 seq. The former passage was first cited by Quatremère, Jour. As. (1835), i. 256, and discussed by Clermont-Ganneau, this, (1900), 3. 2. We are not always clear; perhaps the author of the Fīhrīsī has condensed somewhat.

1 We cannot assume, however, that the poet had a clear idea of what Pahlavi was.

2 The passage, in which useful facts are mixed up with strange notions, is given abridged in Fīhrīsī, p. 13, more fully by Yākētī, iii. 925, but most fully and accurately in the unprinted Mafāṣṣāt al-ṣawā'am.

3 For examples of various peculiarities see the notes to Nöldeke's translation of the story of Ariaḵhūrār Pādāḵān (Götttingen, 1879).
PAIGNTON

from the same source with the other Pahlavi alphabets (the old Aramaic), has quite different forms. This character is also found on some gems and seals. It has been called Chaldæo-Pahlavi, &c. Olshausen tries to make it probable that this was the writing of Media and the other that of Persia. The Persian dialect in both sets of inscriptions is identical or nearly so.6

The name Pahlavi means Parthian, Pahlav being the regular Persian transformation of the old Parthava.8 This fact points to the conclusion that the system of writing was developed in Parthian times, when the great nobles, the Pahlavans, ruled and Media was their main seat, “the Pahlav country.” Other linguistic, graphical and historical indications point the same way; but it is still far from clear how the system was developed. We know, indeed, that even under the Achaemenids Aramaic writing and speech were employed far beyond the Aramaic lands, even in official documents and on coins. The Iranians had no convenient character, and might borrow the Aramaic letters as naturally as they subsequently borrowed those of the Arabs. But this does not explain the strange practice of writing Semitic words in place of so many Persian words which were to be read as Persian. It cannot be the invention of an individual, for in that case the system would have been more consistently worked out, and the appearance of two or more kinds of Pahlavi side by side at the beginning of the Sassanian period would be inexplicable. But we may remember that the Aramaic character first came to the Iranians from the region of the lower Euphrates and Tigris, where the complicated cuneiform character arose, and where it held its ground long after better ways of writing were known. In later antiquity probably very few Persians could read and write. All kinds of strange things are conceivable in an Eastern character confined to a narrow circle. Of the facts at least there is no doubt.

The Pahlavi literature embraces the translations of the holy books of the Zoroastrians, dating probably from the 6th century, and certain other religious books, especially the Mīnūt-Khīrād and the Bundahīsh.7 The Bundahīsh dates from the Arab period. Zoroastrian priests continued to write the old language as a dead tongue and to use the old character long after the victory of a new empire, a new religion, a new form of the language (New Persian), and a new character. There was once a not quite inconsiderable profane literature, of which a good deal is preserved in Arabic or New Persian versions or reproductions, particularly in historical books about the time before Islam.8 Very little profane literature still exists in Pahlavi, the romance of Ardashir has been mentioned above.

Of glossaries, that of West (Bombay and London, 1874) is to be recommended; the same is true of that of the Abbé C. A. G. Ristori, and the English lexicon of Jamaspji Dastur Minocherji (Bombay and London, 1877-1882) is very full, but has numerous false or uncertain forms, and must be used with much caution.

PAILTON, a seaside resort in the Torquay parliamentary division of Devonshire, England, on Tor Bay, 21 m. S.W. of Torquay, on the Great Western railway. Pop. of urban district (1901), 8385. The church of St John is mainly Perpendicular,

5 What the Fährst (p. 13 seq.) has about various forms of Persian writing certainly refers in part at least to the species of Pahlavi. But this information is hardly all reliable, and in the lack of trustworthy specimens little can be made of them.

6 This was finally proved by Olshausen, following earlier scholars; see J. Olshausen, Parthana und Pahlav, Mādā und Māh (Berlin, 1874); and F. K. Geiger, Monatsb. der k. Akad. der Wiss. (Berlin, 1875). See also Olshausen’s Persian Texts, ed. by F. Spiegel (1860), the Bundahīsh by N. L. Westergaard (Copenhagen, 1851) and F. Justi (Leipzig, 1868); other Pahlavi books by Spiegel and Haug, by Hoshangji, and other Indian

6 One book other, the stories of Kalīlog and Dāmmag, in a Syriac version from the Pahlavi, the latter taken from the Sanskrit.

and so to write T for D in many cases, especially in foreign proper names. That a word is written in an older form than the present one is pronounced is a phenomenon common to many languages whose literature covers a long period. So in English we still write, though we do not pronounce, the gutturals in through, and write laugh when we pronounce left.

Much greater difficulties arise from the curious nature of the characters already alluded to. There are some groups which may theoretically be read in hundreds of ways; the same little sign may be ṳ, ṳ, ṳ, ṳ, ṳ, ṳ, and the n too may be either k or kh.

In older times there was still some little distinction between letters that are now quite identical in form, but even the Egyptian fragments of Pahlavi writing of the 7th century show on the whole the same type as our MSS. The practical inconveniences to those who knew the language were not so great as they may seem; the Arabs also long used an equally ambiguous character without availing themselves of the discrIitical points which had been devised long before.

Modern MSS., following Arabic models, introduce diacritical points from time to time, and often incorrectly. These give little help, however, in comparison with the so-called Pāzand or transcription of Pahlavi texts, as they are to be spoken, in the character in which the Avesta itself is written, and which is quite clear and has all vowels as well as consonants. The transcription is not philologically accurate; the language is often modernized, but not uniformly so. Pāzand MSS. present dialectical variations according to the taste or intelligence of authors and copyists, and all have many false readings. For us, however, they are of the greatest use. To get a conception of Pahlavi one cannot do better than read the Mīnūt-Khīrād in the Pahlavi with constant reference to the Pāzand.1 Critical labors is still required to give an approximate reproduction of the author’s own pronunciation of what he wrote.

The coins of the later Sassanian kings, of the princes of Tabaristan, and of some governors in the earlier Arab period, exhibit an alphabet very similar to Pahlavi MSS. On the older coins the several letters are more clearly distinguished, and in good specimens of well-stuck coins of the oldest Sassanians almost every letter can be recognized with certainty. The same holds good for the inscriptions on gems and other small monuments of the early Sassanian period; but the clearest of all are the rock inscriptions of the Sassanians in the 3rd and 4th centuries, though in the 4th century a tendency to cursive forms begins to appear. Only Ṱ and ṳ are always quite alike. The character of the language and the system of writing is essentially the same on coins, gems and rocks as in MSS. The Pahlavi, in part at least, was worked out in a Semitic garb. In details there are many differences between the Pahlavi of inscriptions and the books. Persian endings added to words written in Semitic form are much less common in the former, so that the person and number of a verb are often not to be made out. There are also orthographic variations; e.g. long ṳ in Persian forms is always expressed in book-Pahlavi, but not always in inscriptions. The unfamiliar contents of some of these inscriptions, their limited number, their bad preservation, and the imperfect way in which some of the most important of them have been published 4 leave many things still obscure in these monuments of Persian kings; but they have done much to clear up both great and small points in the history of Pahlavi.2

Some of the oldest Sassanian inscriptions are accompanied by a text belonging to the same system of writing, but with many variations in characters, and an alphabet which, though derived

1 The Book of the Moiwy-e-Khod in the Original Pahlavi, ed. by Fr. Ch. Andreas (Kiel, 1883); idem, The Pāzand and Sanskrit Texts, by E. W. West (Stuttgart and London, 1871).2 See especially the great work of F. Stolze, Peræopolis (2 vols., Berlin, 1870). It was De Sacy who began the decipherment of the inscriptions.

3 Thus we now know that the ligature in book-Pahlavi which means “in,” the original letters of which could not be made out, is ṳ ṳ, between. It is to be read antar.

4 Thus pās, “son,” is written ṳ ṳ instead of ṳ ṳ; pāsh, “before,” is written ṳ ṳ, but in the usual Pahlavi it is ṳ ṳ.

5 Thus the letters in this word are pronounced as mām, “man,” and in the “main” letter as mām, “man.”

6 One book other, the stories of Kalīlog and Dāmmag, in a Syriac version from the Pahlavi, the latter taken from the Sanskrit.
but has a late Norman doorway, and contains a carved and painted pulpit, and in the Kirkham chapel several interesting monuments of the Kirkham family, and a beautiful though damaged stone screen. Among other buildings and institutions are a novitiate of Marist Fathers, a science and art school, a pier with pavilion and concert rooms, and a yacht club. Little remains of an old palace of the bishops of Exeter apart from the 14th-century Bible Tower. Its last tenant was Bishop Miles Coverdale, who in 1535 published the first English translation of the whole Bible. The town owes its popularity to a firm expanse of good bathing facilities, and a temperate climate.

PAIL, a bucket, a vessel for carrying water, milk or other liquids, made of wood or metal or other material, varying in size, and usually of a circular shape and somewhat wider at the top than the bottom. The word is of somewhat obscure origin. The present form points to the O. Eng. *pael*, but the sense, that of a small wine-measure, a gill, is difficult to connect with the present one. The earlier forms of the word in Mid. Eng. spell the word *payle*, *paile*, and this rather points to a connexion with O. Fr. *pelle*, *payelle*, a small pan or flat dish, from Lat. *pelleta*, diminutive of *paella*, dish. The sense here also presents difficulties, "pail" in Eng. being a borrowing.

PAILLERON, ÉDOUARD JULES HENRI (1834–1899), French poet and dramatist, was born in Paris on the 17th of September 1834. He was educated for the bar, but after pleading a single case he entered the first dragoon regiment and served for two years. With the artist J. A. Beaucé he travelled for some time in northern Africa, and soon after his return to Paris in 1860 he produced a volume of satires, *Les Parasites*, and a one-act piece, *LeParasite*, which was represented at the Odéon. He married in 1862 the daughter of François Buloz, thus obtaining a share in the proprietorship of the *Revue des deux mondes*. In 1866 he produced at the Gymnase theatre *LesFaux ménages*, a four-act comedy depending for its interest on the pathetic devotion of the Magdalen of the story. *L'Étincelle* (1879), a brilliant one-act comedy, secured another success, and in 1881 with *LeMonde ab l'on s'ennuie* Pailleron produced one of the most strikingly successful pieces of the period. The play ridiculed contemporary academic society, and was filled with transparent allusions to well-known people. None of his subsequent efforts achieved so great a success. Pailleron was elected to the French Academy in 1882, and died on the 20th of April 1890.

PAIMPOL, a fishing port of western France, in the department of Côtes-du-Nord, 27¼ m. N.N.W. of St Brieuc by road. Pop. (1906), 2340. Paimpol is well known for its association with the Icelandic cod-fisheries, for which it annually equips a large fleet. Steam sawing and boat-building are carried on; grain, &c., is exported; imports include coal and timber. A tribunal of commerce and a school of navigation are among the public institutions.

PAIN (from Lat. *pæna*, Gr. *πάνιν*, penalty, which must be paid: O. Fr. *peine*), a term used loosely (1) for the psychological state, which may be generally described as "unpleasantness," arising, e.g. from the contemplation of a catastrophe or of moral turpitude; and (2) for physical (or psycho-physical) suffering, a specific sensation localized in a particular part of the body. The term is used in both senses as the opposite of "pleasure." Though it is doubtful whether the antithesis between physical and psychical pleasure can be equally well attested. The investigation of the pleasure-pain phenomena of consciousness has taken a prominent place in psychological and ethical speculation, the terms "hedonics" and "algeconomics" (μεγυνιακαν, pain of body or mind) being coined to express different aspects of the subject. So in aesthetics attempts have been made to assign to pain a specific psychological function as tending to increase pleasure by contrast (so Fechner): pain, e.g. is a necessary element in the tragic. Scientists have experimented elaborately with a view to the precise localization of pain-sensations, and "pain-maps" can be drawn showing the exact situation of what are known as "pain-spots." For such experiments instruments known as "esthesiometers" and "algeometers" have been devised. The great variety of painful sensations—throbbing, dull, acute, intermittent, stabbing—led to the conclusion among earlier investigators that pains differ in quality. It is, however, generally agreed that all pain is qualitatively the same, though subject to temporal and intensive modification. (See Psychology; Aesthetics; Nervous System; Sym pathetic System.)

PAIN, BARRY (1867– ), English humorous writer, was educated at Cambridge, and became a prominent contributor to *The Granta*. James Payn inserted his story, "The Hundred Gates," in the *Cornhill Magazine* in 1880, and shortly afterwards he became a contributor to *The Speaker*, and joined the staffs of the Daily Chronicle and *Black and White*. His works include: *In a Canadian Canoe* (1891); papers reprinted from *The Granta*; *Playthings and Parodies* (1892); *The Kindness of the Celestial* (1894); *The Octave of Claudius* (1897); *Eliza* (1900); *Another English Woman's Love Letters* (1901), &c. As a writer of parody and lightly humorous stories his name has become widely known.

PAINÉ, ROBERT TREAT (1731–1814), American politician, a signer of the Declaration of Independence, was born in Boston, Massachusetts, on the 11th of March 1731. He graduated at Harvard in 1749, and at the age of 22 entered the bar. In 1778 he was a delegate to the provincial convention which was called to meet in Boston, and conducted the prosecution of Captain Thomas Preston and his men for their share in the famous "Boston Massacre" of the 5th of March 1770. He served in the Massachusetts General Court in 1773–1774, in the Provincial Congress in 1774–1775, and in the Continental Congress in 1774–1778, and was speaker of the Massachusetts House of Representatives in 1777, a member of the executive council in 1779, a member of the committee which drafted the constitution of 1780, attorney-general of the state from 1777 to 1790, and a judge of the state supreme court from 1790 to 1804. He died in Boston on the 11th of May 1814.

His son, ROBERT TREAT PAINÉ (1773–1811), who was christened Thomas but in 1801 took the name of his father and of an elder brother who died with him in 1794, was a poet of some repute, but his verses have long been forgotten. His best known productions are *Adams and Liberty*, a once popular song written in 1798, *The Invention of Letters* (1795), and *The Ruling Passion*, the Harvard Phi Beta Kappa poem of 1797.

His *Works in Verse and Prose* (Boston, 1812) contains a biographical sketch.

PAINÉ, THOMAS (1737–1809), English author, was born at Thetford, Norfolk, on the 29th of January 1737, the son of a Quaker staymaker. After several years at sea and after trying various occupations on land, Paine took up his father's trade in London, where he supplemented his meagre grammar school education by attending science lectures. He succeeded in 1762 in gaining an appointment in the excise, but was discharged for neglect of duty in 1765. Three years later, however, he received another appointment, at Lewes in Sussex. He took a vigorous share in the debates of a local Whig club, and in 1772 he wrote a pamphlet embodying the grievances of excise men and supporting their demands for an increase of pay. In 1774 he was dismissed the service for absence without leave—in order to escape his creditors.

A meeting with Benjamin Franklin in London was the turning point in his life. Franklin provided him with letters to his son-in-law, Richard Bache, and many of the leaders in the colonies' resistance to the mother country, then at an acute stage. Paine sailed for America in 1774. Bache introduced him to Robert Aitkin, whose *Pennsylvania Magazine* he helped found and edited for eighteen months. On the 9th of January 1776 Paine published a pamphlet entitled *Common Sense*, a telling array of arguments for separation and for the establishment of a republic. His argument was that independence was the only consistent line to pursue, that "it must come to that some time or other," that it would only be more difficult the more it was delayed, and that independence was the surest road to union. Written
in simple convincing language, it was read everywhere, and the open movement to independence dates from its publication. Washington said that it "worked a powerful change in the minds of many men." Leaders in the New York Provincial Congress considered the advisability of answering it, but came to the conclusion that it was unanswerable. When war was declared, and fortune at first went against the colonists, Paine, who was then serving with General Greene as volunteer aide-de-camp, wrote the first of a series of influential tracts called The Crisis, of which the opening words, "These are the times that try men's souls," became a battle-cry. Paine's services were recognized by an appointment to be secretary of the commission sent by Congress to treat with the Indians, and a few months later to be secretary of the Congressional committee of foreign affairs. In 1779, however, he committed an indiscretion that brought him into trouble. He published information gained from his official position, and was compelled to resign. He was afterwards clerk of the Pennsylvania legislature, and accompanied John Laurens during his mission to France. His services were eventually recognized by the state of New York by a grant of an estate at New Rochelle, and from Pennsylvania, and, at Washington's suggestion, from Congress he received considerables of money.

In 1787 he sailed for Europe with the model of an iron bridge he had designed. This was publicly exhibited in Paris and London, and attracted great crowds. In England he determined to "open the eyes of the people to the madness and stupidity of the government." His first efforts in the Prospects on the Rubicon (1787) were directed against Pitt's war policy, and towards securing friendly relations with France. When Burke's Reflections on the Revolution in France appeared, in 1790, Paine at once wrote his answer, The Rights of Man. The first part appeared on the 13th of March 1791, and had an enormous circulation before the government took alarm and endeavoured to suppress it, thereby exciting intense curiosity to see it, even at the risk of heavy penalties. Those who know the book only by hearsay as the work of a furious incendiary will be surprised at the dignity, force and temperance of the style; it was the circumstances that made it inflammatory. Pitt "used to say," according to Lady Hester Stanhope, "that Tom Paine was quite in the right, but then he would add, 'What am I to do? As things are, if I were to encourage Tom Paine's opinions we should have a bloody revolution.'" Paine was indicted for treason in May 1792, but before the trial came off he was elected by the department of Calais to the French convention, and escaped into France, followed by a sentence of outlawry. The first years that he spent in France form a curious episode in his life. He was enthusiastically received, but as he knew little of the language translations of his speeches had to be read for him. He was bold enough to speak and vote for the "detention of Louis during the war and his perpetual banishment afterwards," and he pointed out that the execution of the king would alienate American sympathy. He incurred the suspicion of Robespierre, was thrown into prison, and escaped the guillotine by an accident. Before his arrest he had completed the first part of the Age of Reason, the publication of which made an instant change in his position on both sides of the Atlantic and removed the indignation in the United States from the general. The English Age of Reason can now be estimated calmly. It was written from the point of view of a Quaker who did not believe in revealed religion, but who held that "all religions are in their nature mild and benign" when not associated with political systems. Intermixed with the coarse unceremonious ridicule of what he considered superstition and bad faith are many passages of earnest and even lofty eloquence in favour of a pure morality founded on natural religion. The work in short—a second part, written during his ten months' imprisonment, was published after his release—represents the deism of the 18th century in the hands of a rough, ready, passionate controversialist.

At the downfall of Robespierre Paine was restored to his seat in the convention, and served until it adjourned in October 1795. In 1796 he published a long letter to Washington, attacking his military reputation and his presidential policy with inexcusable bitterness. In 1802 Paine sailed for America, but while his services in behalf of the colonies were gratefully remembered, his Age of Reason and his attack on Washington had alienated many of his friends. He died in New York on the 8th of June 1809, and was buried at New Rochelle, but his body was in 1819 removed to England by William Cobbett.

See the biography by Moncure D. Conway (1892).

PAINESVILLE, a city and the county-seat of Lake county, Ohio, U.S.A., on the Grand River, 3 m. S. of Lake Erie and about 30 m. N.E. of Cleveland. Pop. (1900) 5024, of whom 490 were foreign-born and 179 negroes; (1910) 5301. It is served by the Lake Shore & Michigan Southern, the New York, Chicago & St Louis and the Baltimore & Ohio railways, and by electric lines to Cleveland, Fairport and Ashtabula. It is the seat of Lake Erie College (non-sectarian, for women), the successor of Willoughby Seminary (1847), whose buildings at Willoughby, Ohio, were burned in 1856; the college was opened as the Lake Erie Female Seminary in 1859, and became Lake Erie College and Seminary in 1898 and Lake Erie College in 1908. Painesville is situated in a farming and fruit-growing country, and also has iron, coal, and limestone in the vicinity. On Lake Erie, is the village of Fairport (pop. in 1900, 2072), with a good harbour and coal and ore docks. The municipality owns and operates its waterworks and street-lighting plants. Painesville was founded in 1800-1802 by settlers from Connecticut and New York, conspicuous among whom was General Edward Paine (1746-1841), an officer from Connecticut in the War of Independence; it was incorporated as a village in 1832, and became a city in 1902 under the new Ohio municipal code.

PAINTER-WORK, in the building trade. When work is painted one or both of two distinct ends is achieved, namely the preservation and the coloration of the material painted. The compounds used for painting—taking the word as meaning a thin protective or decorative coat—are very numerous, including oil-paint of many kinds, distemper, whitewash, tar; but the word "paint" is usually confined to a mixture of oil and pigment, together with other materials which possess properties necessary to enable the paint to dry hard and opaque. Oil paints are made up of four parts—the base, the vehicle, the solvent and the driers. Pigment may be added to these to obtain a paint of any desired colour.

There are several bases for oil paint, those most commonly used for building work being white lead, red lead, zinc white and oxide of iron. White lead is by far the commonest of bases for paint. When pure it consists of about 75% carbonate of lead and about 25% of lead hydrate. It is mixed with 6 or 7% by weight of pure linseed oil, and in this form is supplied to the painter. Sulphate of baryta is the chief adulterant used in the manufacture of white lead. White lead has greater covering properties and is more durable than the other bases. It should therefore always be used in external painting. Paints having white lead for a base darken with age, and become discoloured when exposed to the fumes of sulphurated hydrogen, which exists to a greater or less extent in the air of all large towns. Zinc white, an oxide of zinc, is of a purer white colour than white lead. It is lighter, and does not possess the same durability or covering power. It is more useful in internal decoration, as it retains its colour well, even when subjected to the action of gases. Red lead is a lead oxide. It is used chiefly in the priming coat and as a base for some red paints. Like white lead, it is injuried if exposed to acids or impure air, which cause discoloration and decay. Oxide of iron is used chiefly as a base in paints used for covering iron-work, the theory being that no destructive galvanic action can be set up, as might be the case with lead paint when used on iron. A variety of red pigments are made from oxide of iron, varying in hue from a pale to a deep brownish-red. They are quite permanent, and may be used under any conditions.

The vehicle is a liquid in which the particles of the base are held in suspension, enabling a thin coat of paint to be formed, uniform in colour and consistency, and which on drying forms
PAINTER-WORK

a kind of skin over the surface to which it is applied. For oil paint the vehicles used are oils; for distemper water is employed.

The most used as vehicles are chiefly linseed oil, raw and boiled, and poppy-seed oil. Nut oils are occasionally used for inferior work because they are much cheaper. Linseed oil, the one most commonly used, is obtained from the seeds of the flax by warming it and squeezing out the oil under hydraulic pressure. The result, which is of a transparent amber colour, is known as "raw" oil. It is used principally in interiors for light, bright colours, drying somewhat slowly and giving a firm elastic coat. The oil improves by keeping, and is sometimes "reined" with acids or alkalies. "Boiled" oil is the raw oil heated with driers, such as litharge or red lead, to a temperature from 350° to 500° F., at which it is maintained for three or four hours. It is thick and much darker in colour than the raw oil, drying much more quickly, with a coat hard and glossy but less elastic than that produced by raw oil. Poppy-seed oil is expressed from the seeds of the poppy plant. It does not possess the tenacity and quick-drying powers of boiled linseed oil, but being of a very light colour it is used for delicate colours.

Turpentine is used as a solvent, diluent, or "thinner," to bring the paint to a proper consistency so as to allow it to be spread in a thin even coat. When a flat dull surface is desired, turpentine alone is used with the base and the oil is omitted. The best turpentine comes from the pine forests of America. French turpentine is inferior in quality. Russian turpentine is the cheapest, and has usually a strong and unpleasant odour that renders it objectionable to work with. In consequence of the high price of turpentine of good quality, and the increasing difficulty of obtaining it, substitutes are coming into general use.

"Driers" are substances usually added to paint to hasten the process of oxidation, i.e. the drying, of the oil. Some pigments possess this quality, as red lead and white lead. The most notable driers are litharge, sugar of lead, patent driers, sulphate of zinc and manganese dioxide. Liquid driers, such as terebene, are also in use. Litharge, an oxide of lead, is in most general use. Sugar of lead is used, ground in oil, for light tints. Sulphate of zinc and manganese driers are used for paints in which zinc white is the base, which would be injured by lead driers.

"Pigments" are preparations of metallic, earthy or animal origin mixed into paint to give it colour. For oil paint they are usually ground in oil; for distemper they are sold as a finely ground powder. The ordinary pigments are white lead, zinc white, umbers, siennas, ochres, chrome, Venetian red, Indian red, lamp black, bone black, vegetable black, ultramarine, Prussian blue, vermillion, red lead, oxide of iron, lakes and Vandyke brown.

The term "enamel paint" was first given to a compound of zinc white, petrol and resin, which possessed on drying a hard glossy surface. The name is now applied to any coloured paint of this nature. Quick-drying enamels are spirit varnishes ground with the desired pigment. For slow-drying enamels oil varnishes form the vehicle.

Woodwork is often treated with a thin transparent-coloured liquid which changes the colour of the work without hiding the grain of the wood, and if the latter is good a very fine result is obtained. Sometimes the stain is produced by the combination of two or more chemicals applied separately, or soluble pigments may be mixed with a transparent vehicle and applied in the usual way. The vehicles for the pigments vary considerably, and include water, methylated spirit, size, turpentine and clear raw linseed oil.

Varnish is made by dissolving certain gums in linseed oil, turpentine, spirit or water. They give a transparent protective coat to painted and stained surfaces or to wall-paper or plain woodwork. Varnishes usually dry with a very smooth, hard and shiny surface, but "flat" or "dead" surfaces which are without gloss may be obtained with special varnish.

The gums used for hard-wearing or carriage varnishes, such as those to be exposed to the weather and frequently cleaned and polished, are amber, copal and gum animal. Amber is a yellow transparent or clouded gum found on the coasts of the Baltic, and particularly in Prussia. It makes a hard, durable and slow-drying varnish which does not darken with age. Copal is brought from the West India Islands and also from the East Indies. It is the most durable varnish, and being tough and hard is generally used for exterior work. Gum animal, a variety of copal found in the sandy soil of the East Indies. It is hard, durable and quick-drying, but unless the varnish is carefully made it is liable to crack. Varnishes for inside work, or cabinet varnishes, are made with a variety of resins dissolved in linseed oil and turpentine. The resultant gives a hard, lustrous surface, somewhat less durable than that of carriage varnishes. Turpentine varnishes are made from soft gums, such as dammar, common resin and mastic; they are light in colour, cheap and not very durable. Lacquers or spirit varnishes are made from very soft gums, such as shellac and sandarach, dissolved in methylated spirit. They are used for interior work, drying quickly, and becoming hard and very brilliant. Surfaces formed with such varnishes are liable to chip easily and scale off. Oil paint is very much improved by the addition of some varnish; it causes it to dry harder and more quickly and with a fine lustrous surface.

The driers used for varnish are generally acetate of lead or litharge. An excess of driers makes the varnish less durable and causes cracking.

There are many kinds of French polishes, mixed in different ways, that are composed of shellac and sandarach dissolved in spirit. It is applied to the perfectly smooth surface of hard woods with a pad of flannel or wadding wrapped in linen, and well rubbed in with a circular motion.

A dull polish is procured by rubbing beeswax into the wood. It must be thoroughly rubbed in, a little turpentine being added as a lubricant when the rubber works stiffly.

If paint were applied over the bare knots of new wood it would be destroyed, or at least discoloured, by the exudation of the resin from the knots. For the purpose of obviating this the knots are covered with two coats of a preparation called "knotting," made by dissolving shellac in methylated spirit.

Putty is required for stopping nail-holes and small crevices and irregularities in woodwork. It is made ofpowdered whiting and linseed oil mixed together and kneaded into a stiff paste. For light work "hard stopping," made of white lead and whiting, should be employed.

The tools and appliances of the painter are mixing pots, paint kettles to hold the colour for the painter at work, strainer, palette knife, scraping knife, hacking, stopping and chisel knives, the hammer, sponge, pumice, blow-lamp for burning off, and a variety of brushes, such as the duster, the ground brush, the tool, the distemper brush, the fitch and camel-hair pencil for picking out small parts and lines, the sable and flogger for gilding, the stippler; for grained work several steel grazing combs with coarse and fine teeth, grazing brush of hogs' hair, pencil over-grainer, and other special shaped brushes used to obtain the peculiar characteristics of different woods. It is absolutely necessary for good work to use brushes of a fine quality, and although expensive at first cost, they are undoubtedly cheapest in wear.

Workmanship.—New woodwork requires to be knotted, primed, stopped, and in addition painted with three or four coats of oil colour. The priming coat is a thin coat of white lead, red lead and driers mixed with linseed oil and turpentine. Work should always be primed before the stopping is done. The second or "lead" coat is composed mainly of turpentine, linseed oil and white lead. The third coat is the ground for the finishing colour, and is made of white lead and linseed oil and turpentine, with enough pigment to bring it to a tint approaching the finishing colour. The remaining coat or coats is of similar composition. A "flattening" coat is made of white lead and turpentine with the desired pigment. One pound of colour will cover 4 sq. yds. in the first coat and 6 sq. yds. in the additional coat.

Grained finishing is understood among painters to be the imitating of the several different species of ornamental woods, as satinwood, rosewood, mahogany, oak and others. After
the necessary coats of paint have been put on to the wood a
ground is then laid of the required tint and left to dry. The
painter then prepares small quantities of the same colour with
a little brown, and boiled oil and turpentine, and, having mixed
this, spreads it over some small part of his work. The flap-
hog's hair being being dipped in the liquid and drawn down
the newly-laid colour, the shades and grainings are produced.
To obtain the mottled appearance the camels' hair pencils are
applied, and when completed the work is left to dry, and after-
wards covered by a coat or two of good copal varnish. Imitation
wainscots requires the use of combs of various degrees of fineness
to obtain the grain ( whence the process is called combing
by some persons), and the flower is got by wiping off the colour
with a piece of rag. When dry it is over-grained to obtain a more
complete representation of the natural wood, and then varnished.
If the work be done in water-colour and not in oil, beer grounds
to act as a drier are mixed with the colour; this sets it ready for
varnishing. A " patent graining machine," a sort of roller with
a pattern upon it, is often used.

Marbling.—Marbling is the imitation of real marbles and
granites, some of which are represented by splashing on the
carefully prepared ground, which should have been painted and
often rubbed and polished to obtain an even surface; others
have to be painted in colours, and then well varnished.

Painting on Plaster Work.—Plastering should never be painted
until it is thoroughly dry. Portland cement is best left for a
year or two before being painted. Plaster work not previously
painted will require four or five coats, Portland cement five or
six. If plastered work is required to be painted immediately,
it should be executed in Keene's or Parian cement (see PLASTER
Work). A great deal more paint is of course absorbed by
plaster than by wood, just as wood absorbs more than iron.

Painting on Iron.—Iron and steel work should receive a coat of
oxide paint at the manufacturer's works; additional coats are
added after erection. All rust should be previously removed by
means of wire brushes and paraffin or turpentine. The best
paints for external iron work are composed of oxide of iron and
red lead, mixed with linsed oil.
The following is an extract from the building by-laws of the
municipality of Johannesburg:

"All structural metal work shall be thoroughly cleaned from
scale and rust before painting. Paying surfaces in riveted work
shall be painted before putting them together. All surfaces of
steel or iron work inaccessible after erection shall be protected
as far as possible either by coating them with 'Smith's' or other
approved bituminous composition, or by filling the spaces which
they enclose with lime concrete."

Repainting Old Work.—Before beginning to repaint work
of any description it must be thoroughly cleaned. If the
surface is in good condition it will be sufficient to scrub down
with good soap and water and afterwards sponge and wipe
dry. If the work has become rough it will often be necessary
to use pumice stone to facilitate the operation of cleaning.
The pumice should be cut or rubbed to a flat
surface and vigorously applied with plenty of clean water. It
is essential that the work should be quite dry before any paint
is applied. If the old surface is much cracked and blistered no
amount of rubbing with pumice will enable the workman to
obtain a good ground for the new coats, and it will be necessary
to remove the old paint entirely. For this purpose painters most
frequently use a paint burner or torch which burns paraffin oil
under air pressure. This causes the paint to soften and blister
under the heat, in which state it is readily scraped off by a blunt
knife. The old-fashioned grate filled with charcoal held close
to the surface by means of a long handle is now not often used.
There has recently been a considerable increase in the use of
chemical paint removers in paste or liquid form; as a rule these
contain some alkali, such as lime or caustic soda. The prepara-
tion is brushed on to the paint required to be removed, and in
the course of from ten minutes to half an hour the paint becomes
so soft that it can readily be scraped off.

Blistering and Cracking.—The blistering of painted surfaces
may be caused in several ways. If on iron, it may be the result
of a particle of rust which, not having been removed in the pro-
duction, has raised the surface; if on clay, it has been cleaned
and loosened the paint. If on plaster, a particle of unattached
hogs' bristles may have been left, or a similar result. On wood,
blistering is usually caused by painting upon a wet surface or upon unseasoned wood.
Blisters may also be caused by the use of too much oil in paint
exposed to heat, or the application of one coat upon another
before the latter is properly dry. To prevent blistering a
method that has been tried with good results is to apply two
coats of water paint (washable distemper) and follow by two
coats of oil colour or varnish. Cracking is caused by the use of
too much oil in the under coats and too little in the top coats.

Distemper.—New plaster-work must be quite dry before dis-
temper is applied. The work should be stopped (that is, any
irregularities filled up with plaster of Paris mixed with whiting
and water to a paste) and then rubbed perfectly smooth with
glass paper. Clairecole, a solution of thin size and whiting,
is then applied to render the plaster non-absorbent, and this is
followed by distemper of the desired colour. Distemper is made
by soaking whiting in clean water to a creamy consistency.
To this is added size which has been previously warmed, and the
pigment required to colour the mixture; the whole is then well
stirred and strained to remove any lumps. Many patent wash-
able distempers under fancy names are now on the market in
the form of paste or powder, which simply require to be mixed
with water to be ready for use. If applied to woodwork distemper is
apt to flake off.
The "one-knot" brush for cornices and other mouldings and the
"two-knot" and "brass-bound" brushes for flat surfaces are
usually employed for distempering and whitewashing.

A granular surface is produced by stippling or dabbing the
surface with a stiff bristled brush specially made for this purpose.

Gilding, &c.—Very rich effects may be produced both in
external and internal decorations by the judicious use of overlays
of gold or silver. In their application, however, it must always
be borne in mind that they are metals, not paints, and they
should only be used in positions such as would be appropriate
for the actual metals. "Dutch metal" and other imitations
cost about one-third of the price of genuine gilding, and require
to be protected from oxidation by a coat of lacquer. Gold leaf
is affixed with gold size or other adhesive preparations.
The best and most durable work is oil gilding, which involves
less labour, and results in a richer appearance than other methods.
The work is usually primed first of all with a solution of boiled
linseed oil and white lead, and then covered with a fine glutinous
composition called gold size, on which, when it is nearly dry,
the gold leaf is laid in narrow strips with a fine brush, and pressed
well with a pad of cotton-wool held in the fingers. As the slips
must be made to overlap each other slightly to ensure the com-
plete covering of the whole surface, the loose edges will remain
unattached, to be afterwards stuck off with a large sable or
camel-hair brush. The joints, if the work be skillfully executed,
will be invisible. For burnished gilding the work must be
covered with various coats of gluten, plaster and bole, which last
is mixed with gold size to secure the adhesion of the leaf.

PAINTING, in art, the action of laying colour on a surface, or
the representing of objects by the laying of colour on a surface.
It is with painting in the last sense, considered as one of the fine
arts, that this article deals. In the first sense, in so far as
painting is a part of the builder's and decorator's trade it is
treated above under the heading PAINTER-Work. The verb
"to paint" is derived from Fr. peindre (peint, the past
participle, was possibly the earliest part adopted, as is suggested
in the New English Dictionary, from Lat. pingere, to paint. From the past participle pictus comes pictura, picture, and from the root pig, pigment. The ultimate meaning of the root is probably to color, adorn, and is seen in Gr. ποικίλος, many-colored, variegated.

In Part I. of this article, after a brief notice of the general character of the art and an account of its earliest manifestations, a sketch is given of the course of its development from the ancient Egyptian period to modern times. (An account, by countries, of recent schools of painting will be found as an appendix at the end of Part III.) The point of view chosen is that of the relation of painting to nature, and it is shown how the art, beginning with the delineation of contour, passes on through stages when the effort is to render the truth of solid form, to the final period when, in the 17th century, the presentment of space, or nature in all her extent and variety, becomes the subject of representation. Certain special forms of painting characteristic of modern times, such as portraiture, genre painting, landscape, still-life, &c., are briefly discussed.

Part II. consists in tables of names and dates intended to afford a convenient historical sketch of the principal schools of painting from the 12th century a.d. downwards.

Part III. is devoted to a comprehensive treatment of the different technical processes of painting in vogue in ancient and modern times.

 Authorities.—There is one elaborate general treatise on the whole art of painting in all its branches and connections. It is by Paillot de Montaubert, and was published in Paris (1825). It is in three substantial volumes, with an additional volume of plates. It begins with establishing the value of rules for the art, and giving a dictionary of terms, lists of artists and works of art, &c. Vols. ii. and iii. give the history of art in ancient, medieval and modern times. Vols. iv., v., vi. and vii. contain discussions on choice of subjects, design, composition, &c.; on proportions, anatomy, expression, drapery; on geometry, perspective, light and shade, and colour. In these volumes are also given a list of classical works with their dependence and various modifications. There are synopses of the art of different countries, with the different processes, pp. 285–503 take up the different kinds of painting, history, portrait, landscape, genre, &c.; and pp. 503–661 are devoted to materials and processes, which subject is continued in vol. ix. To encyclopaedic painting 125 pages are given, and too to painting in air. A long discussion on painting grounds and pigments follows, while other processes of painting, in tempera, water-colour, enamel, mosaic, &c., are more briefly treated in about 200 pages, while the work concludes with a chapter on various artistic impediments. Vol. i., it should be said, contains on 70 pages a complete synopsis of the contents of the successive volumes. The best general History of Painting is that by Wollman and Woermann (Eng. trans., London, 1880, &c.), but it does not go beyond the 16th century A.D. See also the following articles on China, Art, Japan (Art), Egypt (Art), Greek Art, Roman Art, &c.

For the Italian schools of painting may be consulted: Crowe and Cavalcaselle, History of Painting in Italy (2nd ed., London, 1902, &c.), and Cavalcaselle, Modern Italian Art (2nd ed., London, 1885); and under the titles History of Painting in Italy (3 vols., 1864–1866), and History of Painting in North Italy (2 vols., 1871), Venturi, Storia dell'arte italiana (Milan, 1901, &c.).

For the Dutch: Wurzbach: Bode, Studien zur Geschichte der Holländischen Malerei (Braunschweig, 1883) and Rembrandt und seine Zeitgenossen (Harlesheim, 1890, &c.); Havard, The Dutch School of Painting (trans., London, 1885).

PART I.—A Sketch of the Development of the Art

§1. Constituents and General Character.—If we trace back to the parent stock the various branches that support the luxuriant modern growth of the graphic art, we see that this parent stock is in its origin twofold. Painting begins on the one side in outline, and on the other in colouring; painting of a colour should show over a surface. In both cases the motive is at first utilitarian, or, at any rate, non-artistic. In the first the primary motive is to convey information. It has been noticed of certain savages that if one of them wants to convey to a companion the impression of a particular animal or object, he will draw with his finger in the air the outline of some characteristic feature by which it may be known, and if this do not avail he will sketch the same with a pointed stick upon the ground. It is but a step from this to delineation on some portable tablet that retains what is scratched or drawn upon it, and in this act a monument of the graphic art has come into being.

In the other case there are various motives of a non-aesthetic kind that lead to the covering of a surface with a coat of another substance. The human body, the first object of interest to man, is tender and is sensitive to cold. Wood, one of the earliest building materials and the one material for any sort of boat-building, is subject, especially when exposed to moisture, to decay. Again, the early vessel of clay, of non-aesthetic character, may imperfection be burned, is porous. Now the properties of certain substances suitable for adhesive coatings on anything that needed protection or reinforcement would soon be noticed. Nunctuous and oily substances like animal fat, mixed with ashes or some such material, are smeared by some savages on their bodies to keep them warm in cold regions and to defend them against insect bites in the tropics. Wax and resin and pitch, liquefied by the heat of the sun or by fire, would lend themselves readily for the coating of wood with a substance impervious to moisture. Vitreous glazes, first no doubt the result of accident, fused over the surface of the primitive clay vessel would give it the required impermeability. This is no more art than the mere delineation which is the other source of painting, but it begins to take on itself an aesthetic character when colour plays a part in it.

There are physiological reasons why the colour red exercises an exceptional influence, and strong colours generally, like glittering surfaces, make an aesthetic appeal. In prehistoric times the flesh was sometimes stripped from the skeleton of a corpse and the bones rubbed with red earth or ruddle; while the same easily procured colouring substance is used to decorate the person or the implement of the savage. In this sensibility to colour we find a second and distinct origin of the art of painting.

What a perspective does a glance back at the development of painting afford! Painting, an art that on a flat surface can suggest illusion the presence of solid forms with length, breadth and thickness; that on the area of a few square inches can convey the impression of the vast spaces of the universe, and carry the eye from reeding plane to plane till the person or objects that people them grow too minute for the eye to discern; painting that can deck the world in Elysian brightness or veil it in the gloom of the Crucifixion, that intoxicates the senses with its revelation of beauty, or magician-like withdraws the veil from the mysterious reality of nature; the art that can exhibit all this, and yet can suggest a hundredfold more, if it can show, and by a line, a shade, a touch, can stir within us “thoughts that do often lie too deep for tears”—this Painting, the most fascinating, because most illustrative in its nature, of all the arts of form, is in its first origin at one time a mere display to attract attention, as if one should cry out “See here!” and at another time a proaic answer to a prosaic question about some natural object, “What is it like?” The coat or streak or dab of colour, the informing outline, are not in themselves aesthetic products. The former becomes artistic when the element of arrangement or pattern is introduced. There is arrangement when the shape and size of the mark or marks have a studied relation to those of the surface on which they are displayed; there is pattern when they are combined among themselves so that while distinct and contrasted they yet present the appearance of a unity. Again, the delineation, serving at first a purpose of use, is not in itself artistic, and it is a difficult question in aesthetic whether any representation of nature that aims only at resemblance really
PAINTING

comes therefore that in this article the word “painting” means the spreading of thin films of colouring matter over surfaces to which they are made by different means to adhere, and it will only be taken in a wider sense in certain exceptional cases just indicated.

§ 3. Importance in the Art of the Representation of Nature.—If we regard painting as a whole, the imitation of nature may be established as its most distinctive characteristic and the guiding principle of its development. It must at the same time be understood that in the advanced criticism of painting, as it is formulated in modern times, no distinction is allowed among the different elements that go to make up a perfect production of the art. In such a production the idea, the form, the execution, the elements of representation and of beauty, and the individual expression of the artist in his handiwork, are essentially one, and none of them can be imagined as really existing without the others. It is not the case of a thought, envisaged pictorially, and deliberately clothed in an artistic dress, but of a thought that would have no existence save in so far as it is expressible in paint. This is the modern truth of the art, and the importance of the principle here involved will be illustrated in a later section, but it must be borne in mind that the painting to which this principle applies is a creation of comparatively modern times. As in music so in painting, it has been reserved for recent epochs to manifest the full capabilities of the art. Whereas the arts of architecture and sculpture, though they have found in the modern era new fields to conquer, yet grew to their full stature in ancient Hellas, those of music and painting remained almost in their infancy till the Renaissance. It was only in the 16th and 17th centuries that painters obtained such a mastery on the one hand over the forms of nature, and on the other over an adequate technique, that they were able to create works in which truth and beauty are one and the artistic speech exactly expresses the artistic idea. For this the painter had to command the whole resources of the science of perspective, linear and aerial, and all the technical capabilities of the many-sided processes of oil-paint. Till that stage in the development of the art was reached work was always on one side or another tentative and imperfect, but all through these long periods of endeavour there is one constant feature, and this is the effort of the artist to attain to truth in the representation of nature. No matter what was the character of his task or the material equipment of which he disposed, this ideal was for ever before his eyes, and hence it is that in the relation of the painter's work to nature we find that permanent feature which makes the development of the art from first to last a unity.

§ 4. General Scheme of the Development of the Art.—From this point of view, that of the relation of the work of the painter to nature, we may make a rough division of the whole history of the art into four main periods.

The first embraces the efforts of the older Oriental peoples, best represented by the painting of the Egyptians; the second includes the Graeco-Roman and the beginning of the 15th century; the third, the 15th and 16th centuries; and the fourth the time from the beginning of the 17th century onwards. In the first period the endeavours are after truth of contour, in the second and third after truth of form, in the fourth after truth of space.

The Egyptian artist was satisfied if he could render with accuracy, and with proper emphasis on what is characteristic, the silhouettes of things in nature regarded as little more than flat objects cut out against a light background. The Greek and the medieval artist realized that objects had three dimensions, and that it was possible on a flat surface to give an indication of the thickness of anything, that is of its depth away from the spectator, as well as its length and breadth, but they cannot be said to have fully succeeded in the difficult task they set themselves. For this there was needful an efficient knowledge of perspective, and this the 15th century brought with it. During the 15th century the painter fully succeeds in mastering the representation of the third dimension, and during the next he exercises the power thus acquired in perfect freedom, producing some of the most convincing and masterly presentations of solid
forms upon a flat surface that the art has to show. During this period, however, and to a more partial extent even in the earlier classical epoch, efforts were being made to widen the horizon of the art and to embrace within the scope of its representations not only solid objects in themselves, but such objects as a whole in space, in due relation to each other and to the system of things as a whole, and that the scope of their work was as extended as that of the Italian painter of the 16th century. The view taken in this article will presently be justified, but a word may be said here as to Greek painting in general and its relation to sculpture. The main arguments in favour of the more popular hypothesis of phases of sculpture, and partly by considering some of the general considerations, and partly on the existence of some examples which seem to show the artist grappling with the problems of space. The general argument, that because Greek sculptors achieved so much we must assume that the painters brought their art to the same level, is of no weight, because it has been already pointed out that painting and music are not in their development parallel to sculpture and architecture. Nothing, moreover, is really proved by the facts that painting was held by the ancients in higher estimation than its sister art, and that the painters gained great wealth and fame. Painting is a more attractive, more popular art than sculpture. It represents nature by a sort of trick or illusion, whereas sculpture with its three dimensions is more a matter of course. It is a puzzle how the object or scene, with its colours as well as its forms, can be made to appear on a few square inches of flat surface, and the artist who has the secret of the illusion is at once a man of mark. In Greece this was specially the case, because painting there made its appearance rather later than sculpture and so was from the first more conspicuous. Hence literary writers, when they refer to the arts generally, quote a painter rather than a sculptor. The people observed the painters, and these naturally made the most of themselves and of their art. The stories of the wealth and ostentation of some of these show that there was an atmosphere of réclame about the painters that must have affected the popular estimate, in an aesthetic sense, of their work. Then, too, popular criticism of painting has no standard. To the passer-by who watches the pavement artist, the result of his operations seems nature itself.

"Better than I saw not who saw the truth," writes Dante (Purg. xii. 68) of incised outlines on a pavement, that cannot go very far in the way of painting in the natural similitude. Vasari, though a trained artist, writes as if they "vied with nature" of certain works that, though excellent for their day, do not approach the modern type. We think ourselves that Raphael's babies are like nature till we see Correggio's, and that Venetian Venuses are "real flesh and blood" till that of Velasquez comes to prove them paint. The fact is that the impression "true to nature" is a relative one, and very little weight should be given to a merely popular or literary judgment on a question of the kind. Hence we must not assume that because ancient painting was extravagantly praised by those who knew no other, it therefore covered all the field of the art.

§ 6. The Earliest Representative Art.—Naturalistic design of a very effective kind appears at a very early stage of human development, and is practised among the most primitive races of the actual world, such as the Australians, the Bushmen of South Africa and the Eskimo. Of the existence of such art different explanations have been offered, some finding for the representations of natural objects motives of a religious or magical kind, while others are content to see in them the expression of a simple artistic delight in the imitation of objects of interest. The extraordinary merit, within certain limits, of this early naturalistic work can be accounted for on sociological lines. As Grosse has put it (The Beginnings of Art, p. 198), "Power of observation and skill with the hand are the qualities demanded for primitive naturalistic pictorial art, and the faculty of observation and handiness of execution are at the same time the two indispensable requisites for the primitive hunter life. Primitive pictorial art, with its peculiar characteristics, thus appears fully comprehensible to us as an aesthetic exercise of two faculties which the struggle for existence has developed and improved among the primitive peoples." So far as concerns the power of seizing and rendering the characteristics of natural objects, some of the earliest examples of representative art in the world are among the best. The objects are animals, because these were the only ones that interested the early hunter, but tens of thousands of years ago the Palaeolithic cave-dwellers of western France drew and carved the mammoth, the reindeer, the antelope, and the horse, with astonishing skill and spirit. Fig. 6, Plate III., shows the famous sketch of a mammoth made by a prehistoric hunter and artist of western France. The tusks, the trunk, the little eye, the forehead, and especially the shaggy fall of thick long-hairied elephant, and all effectually rendered. Figs. 1, 2 and 3, Plate I., show three of the astonishingly marvellous series of prehistoric carvings and incised drawings, from the caves of southern France, published by the late Édouard Piette. We note especially the remarkable effort to portray a stag turning its head, and the close observation displayed in the representation of the action of a running buck.

Even more striking are the Palaeolithic paintings discovered in the cave of Altamira at Santillane, near Santander in Spain. These are less ancient than the carvings and sketches mentioned above, but they date from a time when what is now Great Britain was not yet divided from the continent by the Channel, when the climate of southern Europe was still cold, and when animals now extinct—such as the European bison—were still common. These paintings, boldly sketched in three colours, may be reckoned as some 30,000 years old. They display the same power of correct observation and artistic skill as the earlier carvings. Notice in the remarkable examples given on Plate II. the patches on the bison's winter coat and the red colour of the hide where, with the progress of the spring, he has got rid of the long hair from the more prominent parts of his body by rubbing himself against the rocks. The impressionist character of some of these sketches is doubtless partly due to the action of time; but note how, in the case of the great boar, the artist has represented the action of the legs in running as well as standing in much the same way as might be done in a rapid sketch by a modern painter. The mystery of these astounding paintings is increased by the fact that they are found in a cave to which no daylight has ever penetrated, sometimes in places almost inaccessible to sight or reach, and that they are surrounded by symbols of which none can read the meaning (see the two lozenges in fig. 3, Plate I.).

Palaeolithic art is, however, a phenomenon remote and isolated, and in the history of painting its main interest is to show how ancient is the striving of man after the accurate and spirited representation of nature. Modern savages on about the same plane of civilization do the same work, though not with equal artistic deftness, and Grosse reproduces (loc. cit., ch. vii.) some characteristic designs of Australians and Bushmen. Some of these are of single figures, but there are also "large associated groups of men and animals with the landscapes around them." The pictures consist in outlines engraved or scratched on stone or wood or on previously blackened surfaces of hide, generally, though not always, giving profile views, and are sometimes filled in with flat tints of colour. There is no perspective, except to this extent, that objects intended to appear distant are sometimes made smaller than near ones. In the extended scenes the figures and objects are dispersed over the field, without any arrangement on planes or artistic composition, but each is delineated with spirit and in essential features with accuracy.

It is a remarkable fact, but one easily explained, that when man advances from the hunter stage to a more settled agricultural life

these spontaneous naturalistic drawings no longer appear. Neolithic man shows a marked advance on the capacity of his Palaeolithic predecessors in all the useful arts of life: his tools, his pottery, his weapons; but as an artist he was beyond comparison inferior. His attempts to draw men and beasts resulted in no more than conventional symbols, such as an intelligent child might scribble; of the Palaeolithic man’s taste for design, as shown in the carved work of the caves, or of his power of reproducing nature, there is not a sign. Keenness of observation and deftness of hand are no longer developed because no longer needed for the purposes of existence, and representational art almost dies out, to be, however, revived at a further stage of civilization. At this further stage the sociological motive of art is commemoration. It is in connexion with the tomb, the temple and the palace that in early but still fully organized communities art finds its field of operations. Such communities we find in ancient Egypt and Babylonia, while similar phenomena showed themselves in old Oriental lands, such as India and China.

§ 7. The Painting of Contour: Egypt and Babylonia.—In ancient Egypt we find this graphic delineation of natural objects, so spontaneous and free among the hunter tribes, reduced to a system and carried out with certain well-established conventions. The chief of these was the almost universal enigmase in profile of the subject to be represented. Only in the case of subsidiary figures might a front or a back view, or a three-quarter view be essayed. To bring the human figure into profile it was conventionalized, as fig. 7, Plate III., will show. The subject is an Egyptian of high rank, accompanied by his wife and son, in the marshes of the Delta. It is a part of a wall-painting from a tomb at Thebes dating about 1500 B.C. The head, it will be seen, is in profile, but the eye is drawn full-face. The shoulders are shown in front view, though by the outline of the breast, with its nipple, on the figure’s right, and by the position far to the right of the navel, an indication is given that the view here is three-quarters. At the hips the figure is again in profile, and this is the position also of the legs. It will be observed that the two feet have the big toe on the same side, a device to escape the necessity of drawing the four toes as seen in the outside view of a foot. As a rule the action of these figures is made as clear as possible, and they are grouped in such a way that each is clearly seen, so that a crowd is shown either by a number of parallel outlines each a little in advance of the other suggesting a row seen in slight obliquity, or else by parallel rows of figures on lines one above the other. Animals are treated in the same way in profile, save that oxen will show the two horns, asses the two ears, as in front view, and the legs are arranged so that all are seen.

When the naturalistic tendency in art was at its height the Egyptian artist achieved extraordinary success in the truthful rendering of nature as expressed in the contours of figures and objects. If the human form be always conventionalized to the required flatness, the draughtsman is keen to seize every chance of securing variety. He fastens on the distinctive traits of different races with the zeal of a modern ethnologist, and in the case of royal personages he achieves success in individual portraiture. Though he could not render varieties of facial expression, he made the action of the limbs express all it could. The traditional Egyptian gravity did not exclude humour, and some good caricatures have been preserved. Egyptian drawing of animals, especially birds (see fig. 7, Plate III.), has in its way never been surpassed, and the specific points of beasts are as keenly noted as the racial characteristics of human beings. Animals, domestic or wild, are given with their particular gait or pose or expression, and the accent is always laid on those features that give the suggestion of strength or swiftness or lithe-agility which marks the species. The precision of drawing is just as great in the case of lifeless objects, and any set of early, carefully-executed, hieroglyphic signs will give evidence of an eye and hand trained to perfection in the simplest tasks of the graphic art.

The representation of scenes, as distinct from single figures or groups, was not wholly beyond the Egyptian artist’s horizon. His most ambitious attempts are the great battle-scenes of the period of the New Empire, when a Seti or a Rameses is seen driving before him a host of routed foemen. The king in his chariot with the rearing horses is firmly rendered in the severe conventional style, but the crowd of fugitives, on a comparatively minute scale, are not arranged in the original clear fashion in parallel rows, but are tumbled about in extraordinary confusion all over the field, though always on the one flat plane. By another convention objects that cannot be given in profile are sometimes shown in ground plan. Thus a tank with trees round it will be drawn square in plan and the trees will be exhibited as if laid out flat on the ground, pointing on each side outwards from the tank.

In Babylonia and Assyria the mud-brick walls of palaces were coated with thin stucco, and this was in the interior sometimes painted, but few fragments of the work remain. On the exterior considerable use was made of decorative bands and panels of enamelled tiles, in which figure subjects were prominent, as we learn by the passage from Ezek. xxxiii., about “men portrayed upon the wall, the images of the Chaldæans portrayed with vermilion.” The best idea of Assyrian graphic design is gained from the slabs carved in very low relief, which contain annalistic records of the acts of the king and his people in war and peace. The human figure is treated here in a less conventional scheme, but at the same time with less variety and in a less spirited and interesting fashion than in Egypt. Of animals far fewer species are shown, but in the portraits of the nobler beasts, notably the horse, the lion and the mastiff, there is an element of true grandeur that we seldom find in Egyptian design. Furthermore, the carver of the reliefs had a better idea of giving the impression of a scene than his brother of the Nileland, and in his representations of armies marching and fighting he introduces rivers, hills, trees, groups of buildings and the like, all of course delineated without perspective, but in far truer and more telling fashion than is the case with the scenes from the campaigns of Egyptian conquerors.

§ 8. Painting in Pre-historic Greece.—A new chapter in the history of ancient painting was opened by the discovery of relics of the art in the palaces and tombs of the Mycæan period on the coasts and islands of the Aegean. The charming naturalistic representations of marine plants and animals on the painted vases are quite unlike anything which later Greek art has to offer, and exhibit a decorative taste that reminds us a little of the Japanese. What we are concerned with, however, are rather the examples of wall-painting in plaster found at Tiryns and Mycenæ and in Crete. Of the former the first to attract notice was the well-known bull from Tiryns, represented in profile and in action, and accompanied by a human figure; but of the newer tombs which were excavated later, there is a wide advance in the pictorial art, that certain wall-paintings discovered more recently by Dr Evans at Cnossos in Crete. The question is not of the single figures in the usual profile view, like the already celebrated “Cup-bearer,” however important these may be from the historical side, but of the so-called “miniature” wall-paintings that are now preserved in the museum at Candia, in which figures on a small scale are represented not singly but in crowds and in combination with buildings and landscape features that seem to carry us forward to far more advanced stages of the art of painting. To borrow a few sentences from Dr Arthur Evans’s account of them on their first discovery (Annual British School at Athens, vi. 46): “A special characteristic of these designs is the outline drawing in fine dark lines. This outline drawing is at the same time combined with a kind of artistic shorthand brought about by the simple process of introducing patches of reddish brown or of white on which groups belonging to one or other sex are thus delineated. In this way the respective flesh-tints of a series of men or women are given with a single sweep of the brush, their limbs and features being subsequently outlined on the background thus obtained.” There is here, it is true, no perspective, but there is a distinct effort to give the general effect of objects in a mass, which corresponds curiously with the modern development of the art of painting called “Impressionism.”

§ 9. The Painting of Form: Ancient Greece and Italy.—As
is well known, this early civilization in the Greek world of the second millennium B.C. was almost completely swept away, probably by the political cataclysm of about 1000 B.C. known as the Dorian Migration. Hellenic art proper, in its historical continuity, represents a new start altogether and the beginnings of it need not be sought earlier than about 800 to 700 B.C. The art of painting had then completely lost touch with the graceful naturalism and with the broad generalization of the "Aegean" period, and is represented by figure designs on the so-called "geometric" or "Dipylon" vases of the most primitive kind. For a long time Greek painting is chiefly represented by work on the vases, but that this may be regarded as in the strict sense painting is shown by the fact that tablets or panels (pinakes) that would certainly be called pictures were being painted at the same time by the same technical methods, and in some cases by the same craftsmen, as the vases. As Klein remarks (Euphronios, p. 232), "the most ancient material for Greek painting is clay in the form of the vase as well as of the pinax." Now we find in Pliny's account of the beginnings of Greek painting (Nat. Hist. xxxv. 15 seq.) certain stages indicated in the development of technique, and we are able to illustrate these stages from vases which correspond more or less in their chronological order with the succession of the stages in Pliny. The correspondence is not exact, and there are difficulties in the way of interpreting the statements from the monuments, but the two stages to be brought into connexion. According to Pliny the order of development seems to be (1) outlines; (2) [a] outlines filled in with flat tints, or [b] outlines with linear inner markings but no colour. Outline drawing is obviously always the first stage in the graphic art regarded as delineation, not decoration. The flat tints without inner markings are found on "Dipylon" vases of 800-700 B.C., and as for the inner markings, though there is a difficulty in the exact interpretation of Pliny's words, yet inner markings in the form of lines scratched on these silhouettes make their appearance very early. Two further stages are indicated by Pliny as the introduction of a red colour and the distinction between male and female figures by a painter named Eumarus of Athens. This would be by the use of white, which with red, an oxide of iron, appears on vases of about 600 B.C. Eumarus is also said to have "ventured to imitate all kinds of figures," and we cannot fail here to be reminded of the marvellous François vase at Florence (fig. 8, Plate III.) of the first half of the 6th century, which is of large size and is decorated with a wealth of figure designs from mythological sources that are among the most remarkable productions of the graphic art of the ancient world. Human figures and animals are shown in an extraordinary variety of poses and illustrating all kinds of scenes, and the execution shows a firmness of hand and patience in the rendering of details to which no praise can do justice. The inner markings are rendered by lines with the most scrupulous care and finish. Cimon of Cleonae is said to have followed Eumarus with certain improvements which are of the greatest importance for the future of the art in Greece. He is said to have introduced four innovations: (a) "Catagrapha," which Pliny explains as "profile figures" but which must mean something more than this, seeing that profiles had been in use from the first. "Foreshortenings" is a possible and an intelligible rendering which moreover corresponds with what is further ascribed to him; (b) the representation of "countenances in different positions, looking backwards or upwards or downwards." The other improvements, in giving (c) the details of anatomy and (d) "the wrinkles and folds of drapery," are not of so much importance as such advance is normal and necessary. The introduction of foreshortened views is the matter of real moment, for this is the point at which Greek painting parts company with the older oriental traditions, and enters on a course of its own which leads directly to all the modern developments of the art.

The words of Pliny explaining the term "catagrapha" can be aptly illustrated from the vase paintings connected with the name of Epictetus. Epictetus was the leading figure among a company of Athenian vase decorators of the last decades of the 6th century B.C. and the beginning of the 5th, who usher in the period of the most gifted and original masters of the craft. Their work is marked by efforts to give to the human figure a vigour and expressiveness it had never before attained, and to gain their end they essay all sorts of novel and difficult problems in drawing. In connexion with Pliny's words, Klein remarks (Euphronios, p. 47) that on their vases "the running figures look behind them; those that are jumping, revelling or fighting look up; the lifting or bending ones look down." Some of the best vases decorated by this set of artists, who are the first to use the so-called "red-figured" technique instead of painting as the older masters had done in black on red, are for qualities of strength, variety and animation unequalled by any of their successors of the later periods, yet it is significant of the whole character of this ancient painting that they are always conspicuously more successful with profiles and objects in an upright plane at right angles to the line of sight than with any forms which involve foreshortening or perspective. They are masters of contour but are still struggling for the full command over form, and it is noteworthy that the generation of these greatest of the vase-painters had passed away before these difficulties of foreshortening had been conquered.

We have now followed on the vases the development of Greek painting up to about the time of the Persian wars, and it must be noted that other forms, as on terra-cotta tablets or pinakes, on the flat edges of sarcophagi in the same material, and occasionally on marble slabs or stelae, the same technical characteristics are to be observed. Of painting on a monumental scale Greece proper has hitherto shown no trace, yet at this very juncture, in the decades immediately after the Persian wars, there suddenly makes his appearance one of the greatest representatives of monumental wall-painting known to the annals of the art. This is Polygnotus, who, with some worthy associates, displayed on the walls of public buildings at Athens and at Delphi a series of noble compositions on a large scale that won the admiration of the whole Hellenic community.

To find any remains of mural painting that may seem to lead up to Polygnotus and his school we have to pass beyond the bounds of Greece proper into Italy, where, alike in the Greek and Etruscan cities and also at Rome, painting in this form was practised from an early date. Pliny mentions paintings at Ardea older than the city of Rome, and some very ancient ones at Caere. Two sets of early paintings, not actually on walls but on terra-cotta slabs meant for the coating of walls, have come to light in recent times at Caere, of the ancient Caere some of which, in the British Museum, were dated by the late A. S. Murray at about 600 B.C. (Journal of Hellenic Studies, x. 243), while others in the Louvre may be about half a century later. True wall-paintings, of possibly a still earlier date and certainly of more primitive design, were found in the Campagna at Veii (Dennis, Etruria, ch. i.). The paintings from Caere are executed on a white or yellowish "slip" in a few simple colours, and exhibit single figures in a frieze-like arrangement with little attempt at action and none at grouping. The flesh of the women is left the colour of the white ground, that of the men is painted a ruddy hue. To the 6th, and first half of the 5th century, belong wall-paintings in Italian tombs, which, whether in Greek cities or in Etruscan, show distinct signs of Hellenic influence. Some of these wall-paintings (Antike Denkmäler, ii., Taf. 41-43) show considerable liveliness in colouring and in action, and a freedom and gaiety in female costume that remind us of what we read about the painting of Polygnotus (q.v.). The place of this great painter in the general history of the graphic art is given to him for his ethical greatness and the austere beauty of his single figures, which ancient writers extol. All we have to do here is fix his place in the development of painting by noting the stage at which he had arrived in the representation of nature.

The wall-paintings of Polygnotus and his school must have exhibited a large number of figures powerfully characterized in action and expression, not in a confused mass nor summarized as at Cnossus, nor grouped together as in a modern composition,

nor yet arranged in formal rows one above the other, but distributed at different levels on the one plane of the picture, the levels being distinguished by summary indications of a landscape setting. Parts of some of the figures were hidden by risings of the ground. The general effect is probably represented by the paintings on the vase in the Louvre shown in fig. 9, one side of which exhibits the destruction of the children of Niobe, and the other the Argonauts. Simplicity in design and ethical dignity in the single forms are here unmistakable.

It is probable that Polygnotus had not fully mastered the difficulties of foreshortening with which the early "red-figure" masters were struggling, but later designs both on vases and elsewhere do show that in the 4th century at any rate these had been overcome. The drawing on the so-called Ficoronian Cista, and on the best of the Greek mirror-backs, may be instances. The ancients recognized that in the latter part of the 5th century B.C., painting made a great technical advance, so that all that had gone before seemed archaic, while for the first time "the gates of art" were opened and the perfect masters entered in. The advance is in the direction of the representation not of form only but of space, and seems from literary notices to have implied a considerable acquaintance with perspective science. The locus classicus, one of great importance, is in Vitruvius. In the preface to his seventh book he writes of Agatharcus, a painter who flourished at Athens in the middle and third quarter of the 5th century, that he executed a scene-painting for Aeschylus, and wrote a treatise upon it which inspired the philosophers Democritus and Anaxagoras to take up the subject, and to show scientifically from the constitution of the eye and the direction of rays of light how it was possible in scenic paintings to give sure images of objects otherwise hard to fix correctly, so that when such objects were figured on an upright plane at right-angles to the line of sight some should appear to recede and others to come forwards.

It would not be easy to summarize more aptly the functions of perspective, and if philosophers of the eminence of those just mentioned worked out these rules and placed them at the disposal of the artists, the transition from ancient to modern painting should have been accomplished in the 5th century B.C., instead of just two thousand years afterwards! So far however as the existing evidence enables us to judge, this was not actually the case, and in spite of Agatharcus and the philosophers, painting pursued the even tenor of its way within the comparatively narrow limits set for it by the genius of ancient art (see Greek Art). It may be admitted that in many artistic qualities it was beyond praise. In beauty, in grace of line, in composition, we can imagine works of Apelles, of Zeuxis, of Protagoras, excelling even the efforts of the Italian painters, or only matched by the finest designs of a Raphael or a Leonardo. In the small encaustic pictures of a Pausias there may have been all the richness and force we admire in a Chardin or a Monticelli. We may even concede that the Greek artist tried at times to transcend the natural limits of his art, and to represent various planes of space in perspective, as in the landscape scenes from the Odyssey, or in figure compositions such as the "Alexander and Darius at Issus," preserved to us in a mosaic, or the "Battle-piece" by Aristides that contained a hundred combatants. The facts, however, remain, first that the Greek pictures about which we chiefly read were of single figures, or subjects of a very limited and compact order with little variety of planes; and second, that the existing remains of ancient painting are so full of mistakes in perspective that the representation of distance cannot have been a matter to which the artists had really set themselves. The monumental evidence available on the last point is sufficient to override arguments to the contrary that may be built up on literary notices. No competent artist, or even teacher of drawing, who examines what is left of ancient painting, can fail to see that the problem of representing correctly the third dimension of space, though it may have been attacked, had certainly not been solved. It is of no avail to urge that these remains are not from the hands of the great artists but of mere decorators. In modern times the mere decorator, if he had passed through a school of art, would be as far above such chimeras as a Royal Academician. We have only to consider dispassionately the photographic reproductions from ancient paintings (Herrmann, Denkmäler der Malerei des Altertums, Munich, 1906, &c.) to see that the perspective researches of the philosophers had not resulted in a general comprehension among the artists of the science of receding planes. For example, in the famous wall-painting of "Zeus and Hera on Mount Ida" in the House of the Tragic Poet at Pompeii, the feet of the standing figure of the goddess are nearer to the spectator than the seat of her lord, but the upper part of her form is away on the farther side of him (see fig. 10, Plate III.).

No one who could draw at all would be capable now of such a mistake. In interiors the perspective of the rafters of a roof, of a table, a stool, a throne, is in most cases faulty; and the scale of the figures seems often to be determined rather by their relative importance in the scene than by their position on the planes of the picture. In the Pompeian landscape-piece of "Paris on Mount Ida" (Herrmann, No. 8) there is no sense of the relative proportions of objects, and a cow in the foreground is much smaller than Paris, who is a long way back in the composition.

It is an additional confirmation of this view to find early Christian and early medieval painting confined to the representation of the few near objects, which the older Oriental artists had all along envisaged. If classical painters had really revolutionized design, as it was actually revolutionized in the 15th century of our era, and had followed out to their logical consequence the innovations of Agatharcus, we may be sure that the
influences of these innovations would not have been wholly lost even in the general decline of the art at the break-up of the Roman Empire of the West. In any case, the influence would have survived in Byzantine art, where there was no such cataclysm. Yet we fail to see in the numerous pictorial miniatures from the 5th century onwards, or in the mosaics or the wall-paintings of the same epoch, any more effective grasp of the facts of the third dimension of space than was possessed by the pre-classical Egyptian.

All through the middle ages, therefore, the facts concerning painting with which we are here concerned remain the same, and the art appears almost exclusively concerned with the few selected objects and the single plane. The representation is at most of form and not of space.

§ 10. Early Christian and Early Medieval Painting.—The extant remains of early Christian painting may be considered under three heads: (1) the wall-paintings in the catacombs; (2) the pictorial decorations in books; (3) the mosaic pictures on the walls of the churches. (1) The first are in themselves of little importance, but are of historical interest as a link of connexion between the wall-painting of classical times and the more distinctly Christian forms of the art. They are slightly executed and on a small scale, the earliest, as being more near to classical models, are artistically the best. (2) That form of painting devoted to the decoration and illustration of books belongs more to the art of ornament than to painting proper (see ILLUSTRATED MSS. AND ILLUSTRATION). (3) Early Christian mosaics are noble monuments of the graphic art, and are its best representatives during the centuries from the 5th to the 8th. A dignified simplicity in design suits their large scale and architectural setting, and the aim of the artist is to present in forms of epic grandeur the personages of the sacred narratives. They are shown as in repose or engaged in some typical but simple action; the backgrounds being as a rule plain blue or gold and the accessories of the simplest possible description. The finest Christian mosaic is also the earliest. It is in the apse of S. Pudentiana, Rome, and displays Christ enthroned as teacher with the Apostles seated on each side of Him. It may date from the 4th century. Next to this the best examples are at Ravenna, in the tomb of Galla Placidia, the Baptistry, S. Apollinare Nuovo and S. Vitale, dating from the 5th and 6th centuries. The picture in the baptistery of the "Baptism of Christ" is the most artistic piece of composition and pictorial effect, and next to this comes the "Good Shepherd" of the tomb of Galla Placidia. The finest single figures are those of the white-robed saints between the windows of the nave of S. Apollinare Nuovo, and the most popular representations are the two processions of male and female saints lower down on the same walls. The famous mosaics in S. Vitale depicting Justinian and Theodora with courtiers in attendance, though historically interesting, are designed in a wooden fashion, and later mosaics at Palermo, Venice, Rome and other places are as a rule rather decorative than pictorial. Where the costly material of glass mosaic was not available, the churches of this period would show mural paintings on plaster of much the same design and artistic character, though comparatively ineffective.

In monumental painting, the interval between the early Christian mosaics and mural pictures and the revival of the 13th century is filled by a series of wall and ceiling paintings of Carolingian, Romanesque and early Gothic date, in Italy, Germany and England. The earliest of which account need be taken are those in the recently excavated church of S. Maria Antiqua by the Forum at Rome (Rushworth, in Papers of the British School at Rome, vol. i., London, 1902), where there is a complete and, on the whole, well-preserved series consisting for the most part in single figures and simply composed scenes. Most of the work can be dated to the time of Pope John VII. at the beginning of the 8th century. Its style shows a mixture of Byzantine motives with elements that are native to Rome. It must be remembered that at the time Rome was strongly under Byzantine influence. Passing over some more fragmentary specimens, we may refer next to several series of mural paintings in and near the island of Reichenau at the western end of the lake of Constance, where a school of painting flourished in the latter part of the roth century. The work here is quite as good as anything Italy has to show, and represents a native German style, based on early Christian tradition, with very little dependence on Byzantine models. The most interesting piece is the "Last Judgment" in the church of St George at Oberzell on Reichenau, where, in a very simple but dignified and effective form, we find the earliest existing representation of this standard theme of later medieval monumental art (F. X. Kraus, Wandgemälde der St Georgskirche zu Oberzell auf der Insel Reichenau, Freiburg-i.-Br., 1884).

About a hundred years later, in the latter part of the 11th century, a mural painting of the same theme was executed in the church of S. Angelo in Formis near Capua in southern Italy, the style of which shows a mixture of Latin and Byzantine elements (F. X. Kraus, Die Wandgemälde von S. Angelo in Formis, Berlin, 1893).

To the middle of the 12th century belongs one of the most complete and interesting cycles of medieval wall-decoration, that of the mosaics and scenes illustrating the eleventh chapter of Hebrews, in the apse of the now secularized monastery of Brauweiler, near Cologne, in the Rhineland. Here the pictorial effect is simple, but the decorative treatment in regard to the filling of the spaces and the lines of composition is excellent. The design is Romanesque in its severity (E. Aus'm Werth, Wandmalereien des Mittelalters in den Rheinlanden, Leipzig 1879). Romanesque also, but exhibiting an increase in animation and expressiveness, is the painting of the flat ceiling of the nave of the fine church of St Michael at Hildeshim. In the general decorative effect, the distribution of the subjects in the spaces, the blending of figures and ornament, the work, the main subject of which is the Tree of Jesse, is a masterpiece. Two nude figures of Adam and Eve are for the period remarkable productions. The date is the close of the 12th century.

Succeeding examples show unmistakable signs of the approach of the Gothic period. In the wall-paintings of the nuns' choir of the church of Gurk in Carinthia, a certain grace and tenderness begin to make themselves felt, and the same impression we gain from the extensive cycle in the choir of the Abbey of Brunswick, from the first decades of the 13th century. The picture of Herod's birthday feast is typical of the style of German painting of the time; there is nothing about it in the least rude or tentative. It is neither childish nor barbarous, but very accomplished in a conventional style that is exactly suited from the decorative point of view to a mural painting. The story is told effectively but in quaint fashion, and several incidents of it are shown in the same composition. There is no attempt to represent the third dimension of space, nor to give the perspective setting of the scene, but the drawing is easy and true and expressive. The studied grace in the bend of certain figures and the lively expressions of the faces are traits which prefigure Gothic art (see fig. 11, Plate III.).

Distinctively Gothic in their feeling were the wall-paintings in the chapel at Ramersdorf, opposite Bonn, dating from the beginning of the 14th century. They are only preserved in copies, but these enable us to see with what grace and feeling the figures are designed, how near to Angelico's came the tender angels making music where the virgin is receiving her celestial crown (E. Aus'm Werth, loc. cit.). From the end of the 14th century, Castle Runkelstein, near Botzen in Tirol, has preserved an extensive cycle of secular wall-paintings, much repainted, but of unique interest as giving an idea how a medieval residence of the kind might be adorned. The style is of native growth and no influence from south of the Alps is to be discerned (Janitschek, Geschichte der deutschen Malerei, Berlin, 1890, 198 seq.). Technically speaking, all these mural paintings consist in little more than outlines filled in with flat tints, neither modelling of the forms nor perspective effect in the setting is attempted, but the work so far as it goes is wholly satisfactory. There is no coarseness of execution nor anything in the forms,

PAINTING

§ 11. Beginnings of the Picture: German and Early Flemish Panel Painting.—From the decorative panels introduced into wooden screen-work was developed in Germany and Flanders the picture proper, that is to say, panel painting passing out of use owing to the prevalence of the north of Gothic architecture, which does not admit of wall spaces for the display of pictures, but substitutes as a form of painting the stained-glass window. In Italy, where Gothic was treated as a plaything, the wall spaces were never sacrificed, and in the development of the art the mural picture took the lead, the painted panel remaining on the whole of secondary importance.

Priority in this development of the picture is claimed in Germany for the school of Prague, where a guild of painters was founded in 1348, but the first northern school of painting that influenced other schools and plays a part in the history of painting as a whole is the so-called学校of Cologne, where painters such as Meister Wilhelm and Hermann Wynnrich achieved reputation in the 14th century, and produced as their successor in the 15th Stephan Lochner, author of the so-called "Dombild" in the cathedral, and of the "Virgin of the Priests' Seminary." A little later than the earliest Cologne masters appears Hubert van Eyck, born near Maestricht at no great distance from the Rhineland capital, who with his younger brother, Jan, heads the Early Flemish school of painting. Hubert is one of the great names in the history of the art, and is chiefly responsible for the altar-piece of the "Adoration of the Lamb" at Ghent, the most important masterpiece of the northern schools before the 17th century, and the earliest monument of the then newly developed art of oil painting. Table No. I. in Part II. of this article gives the names of the chief successors of the Van Eycks, and the school ends with the life and work of Quintin Matsys of Antwerp; in the first quarter of the 16th century. The spirit of the early Cologne school, and in the main of that of Flanders, is idyllic and devotional, but the artists of the latter school achieve extraordinary force and precision in their representation of the facts of nature. They are, moreover, the first painters of landscape, for in their hands the gold background of the medieval panels yields place to a rendering of natural scenery and effect of distance, minute in details and fresh and delightful in feeling. The famous picture ascribed by some to Hubert van Eyck in the collection of Sir Francis Cook at Richmond is a good example. The subject is the "Three Mariæ at the Sepulchre," and the background is a wonderful view of a city intended for Jerusalem (see fig. 12, Plate IV.).

In Germany, on the other hand, the tendency of the 15th century was towards a rather crude realism in details, to which the higher artistic qualities of beauty and devotional sentiment were often sacrificed. This is a new phenomenon in the history of the art. In the earlier Oriental, and the medieval phases of painting, though there is a constant effort to portray the truth of nature, yet the decorative instinct in the artist, his feeling for pattern, was a controlling element in the work, and the representation was conventionalized into a form that satisfied the ideal of beauty current at the time. Jan van Eyck was matter-of-fact in his realism, but avoided ugliness, whereas in Germany in the 14th and 16th centuries we find action and expression exaggerated to contortion and grimace, and all artistic qualities sacrificed to a mistaken idea of force. German art was, however, saved by the appearance of some artists of great genius who more than made up for the national insensibility to beauty by their earnestness and truth. Martin Schongauer of Colmar learnt his art from the painters of the Flemish Netherlands, and imbibed something of the feeling for beauty which the successors of Hubert van Eyck had never wholly lost. After Schongauer German art culminates at Nuremberg in the person of Albrecht Dürer, and a little later in that of Hans Holbein the younger. Contemporary with Dürer, Mathias Grunewald of Colmar exhibits a dramatic power in his creations that compensates for their exaggerated realism, and Bartholomäus Bruyn, of Cologne, presages the future success of the northern schools in portraiture. In Germany, however, the wars of religion in the 16th century checked the further growth of a national art. Holbein's migration to England is a significant sign of this, and German art in this phase of it may be said to come to an end in the person of Adam Elsheimer of Frankfort, who introduced German painting at Rome about the year 1600.

In the Netherlands the early religious school ends, as we have seen, with Quintin Matsys, and the next generation of Flemish painters for the most part practise their art in Italy, and import Italian fashions into the painting of their own country. From the ranks of these so-called Italianizers in the Flanders of the 16th century proceeds a little later the commanding personality of Rubens.

§ 12. The Rise of Schools of Painting.—The expression "school of painting" has more than once been used; what is the meaning of it? The history of painting has hitherto been treated in the article as a development that proceeded according to a natural law of evolution in independence of individuals. In painting, however, as in all the higher operations of the arts, the initiative of the individual counts for much, and the action and reaction on each other of individuals, and those groups of individuals whom common aims and practice draw together into schools, make up for us a good part of the interest of the historical study of painting. At certain periods this particular
interest has been lacking. In ancient Egypt, for example, and among the older Oriental peoples generally, schools of painting and sculpture were lacking in the true modern sense did not exist, for the arts were carried on on traditional lines and owed little, so far as records tell, to individual initiative. In ancient Greece, on the contrary, we find ourselves at once in an atmosphere of names and achievements which give all the glamour of personal and biographical interest to the story of art. In the early Christian and early medieval periods, we return again to a time when the arts were practised in the same impersonal fashion as in the oldest days, but with the later medieval epoch we emerge once more into an era where the artist of genius, with his experiments and triumphs, his rivals and followers, is in the forefront of interest; when history is enlivened with anecdote, and takes light and shade from the changing fortunes of individuals.

There is a danger lest the human interest of such a period may lead us to forget the larger movements, impersonal and almost cosmic, which are all the time carrying these individuals and groups forward on their destined course. The history of painting cannot be understood if it be reduced to a notice, however full, of separate "schools" or of a series of biographies, facts which are more of the nature of individual artists. Hence it is of the utmost importance to give in what follows it is still the main course of the development of the art in its relation to nature that will be kept in view, while the information about names and dates and mutual relations of artists and schools, which is in its own way equally important, will be furnished in the tables constituting Part II. of this article.

What has just been said will prepare the reader for the fact that the first schools of painting here mentioned are those of Germany and Flanders, not those of Italy, though the latter are more important as well as actually prior in point of time.

§ 13. The Gothic Movement and the Proto-Renaissance, in Their Influence on Painting north and south of the Alps.—The revival of the arts of sculpture and painting in the Italy of the last part of the 13th century was an event of capital importance, not only for that country but for the west at large. Its importance has, however, been exaggerated, when it has been said to imply the rediscovery of the arts after a period in which they had suffered an entire eclipse. So far as Italy is concerned, both sculpture and painting had in the previous period sunk to a level so low that they could hardly be said to exist, but at the same epoch in lands north of the Alps they were producing works of considerable merit. Romanesque wall-painting of the 12th century, as represented in some Rhineland churches and cloisters, is immeasurably better than anything of the same period south of the Alps. In the arts of construction and ornament the lead remained for a long time with the northern peoples, and in every branch of decorative work with the exception of mosaic the craftsmanship of Germany and France surpassed anything that native Italian workmen could produce. By the middle of the 12th century the intellectual and social activity of the French people was accompanied by an artistic movement that created the most complex and beautiful architectural monuments that the world has seen. The adornment of the great French Gothic cathedral was as artistically perfect as its mass, and the design for the construction of the monument at which the painter aims, that of glowing and sumptuous colour, nothing can surpass the stained-glass windows of the Gothic churches, while the exteriors of the same buildings were enriched with hundreds of statues of monumental dignity endowed with a grace and expressiveness that reflect the spirit of the age.

The Gothic age in France was characterized by humanity, tenderness and the love of nature, and there are few epochs in human history the spirit of which is to us more congenial. The 12th century, which witnessed the growth of the various elements of culture that combined to give the age its ultimate character, saw also a movement of revival in another sphere. The reference is to what has been aptly termed a "Proto-Renaissance," the characteristic of which was a fresh interest in surviving remains of classical antiquity. In more than one region of the west, where these remains were specially in evidence, this interest manifested itself, and the earliest sign of it was in Provence, the highly Romanized part of southern Gaul known for excellence as the "Province." To this is due the remarkable development of decorative sculpture in the first decades of the 13th century, which gave to that region the storied portals of St Gilles, and of St Trophime at Arles. Somewhat later, in the early part of the 13th, those portions of southern Italy under the direct rule of the emperor Frederick II. presented a similar phenomenon that has been fully discussed by M. Bertaux in his L'Art dans l'Italie méridionale (Paris, 1904). There were other centres of this same movement, and a recent writer enumerates no fewer than seven. The Gothic movement proper depended in no degree on the study of the antique, and in art the ornamental forms which express its spirit are naturalistic, not classical, while the fine figure sculpture above referred to is quite independent of ancient models, which hardly existed in the central regions of France where the Gothic movement had its being. Still the proto-Renaissance can be associated with it as another phase of the same awakening of intellectual life that marked the 12th century. Provence took the lead in the literary revival of the time, and the artistic movement that followed on this was influenced by the idea of the existence in those regions of abundant remains of classical art.

The Gothic movement was essentially northern in its origin, and its influence radiated from the Ile de France. What has been described as the idyllic grace, the tenderness, that mark the works of the early Cologne school, and to some extent those of the early Flemings, were Gothic in their origin, while the feeling for nature in landscape that characterizes van Eyck, and the general tendency towards a realistic apprehension of the facts of things, may also be put down to the quickening of both thought and sympathy due to the Gothic movement. Hence it is that the northern schools of painting are noticed before the Italian because they were nearer to the source of the common inspiration. All the lands of the West, however, exhibit, each in its own special forms, the same stir of a new intellectual, religious and artistic life. In Italy we meet with the same phenomena as in France, a proto-Renaissance, first in southern Italy and then, as we shall presently see, at Rome and at Pisa, and a religious and intellectual movement on Gothic lines that was embodied in the attractive personality of St Francis of Assisi. Francis was as perfect an embodiment of the Gothic temper as St Louis himself, and in his romantic enthusiasm, his tenderness, his humanity is in spirit more French than Italian.

§ 14. The Rise of the Italian Schools of Painting.—The revival of the arts in Italy in the last part of the 13th century was the outcome of the two movements just noticed. The art of Niccola Pisano is now recognized as a phase of the proto-Renaissance of southern Italy, whence his family was derived. It represents a distinct advance on the revived classical sculpture of Provence or Campania because Niccola's artistic personality was a strong one, and he gives to his work the impress of the individual of genius. Throughout its history Italian art depends for its excellence on this personal element, and Niccola's achievement is epoch-making because of his personal vigour, not because he reinvented a lost art. Towards the end of the 13th century, there was at Rome a tendency towards the study of antique models, and here again the revival is connected with the names of gifted individuals. Among these the most noteworthy are the Roman Pietro Cavallini and Duccio di Buoninsegna of Siena. The condition of painting in Italy in late medieval days has already been indicated. Cavallini and Duccio now produce, in two standard forms of the art, the mural painting of the "Last Judgment" and the enthroned Madonna with angels—works characterized by good taste, by largeness and suavity of treatment, and by an execution which, if still somewhat primitive and laboured, at any rate aims at beauty of form and colour. The recently uncovered fresco of the Last Judgment by Cavallini, executed about 1293 on the western wall of S. Cecilia in Trastevere at Rome, is classical in feeling and represents an immense advance on the older rendering of the same subject in S. Angelo in Formis (see § 10).
enthroned Madonna in the Rucellai chapel of S. Maria Novella at Florence, ascribed by Vasari to Cimabue, is now assigned by many to Duccio of Siena, and presents similar attractive qualities. Cimabue, a Florentine contemporary of Cavallini and Duccio, is famed in story as the chief representative of the painting of this period, but we possess no certain works from his hand except his mosaic at Pisa. His style would probably correspond to that of the painters just mentioned. His chief importance for our purpose resides in the fact that he was the teacher of the Florentine Giotto.

If the artists just referred to represented a revived classicism rather than a fresh and independent study of nature, Giotto is essentially a creation of the Gothic movement and his close association with the Franciscan cycle of ideas brings this fact into clearer relief. Giotto is in no way dependent on the study of the antique, but relies on his own steady and penetrating outlook upon man and upon nature. He is Gothic in his humanity, in his sympathy, his love of truth, and he incorporates in his own person many of the most pleasing qualities of Gothic art as it had already manifested itself in France, while by the force of his own individual genius he raises these qualities to a higher level of artistic expression.

In the work of Giotto painting begins to enter on its modern era. The demonstrative element permanently takes the pre-eminence over the more decorative element we have called pattern-making. Though the pattern is always present, the elements of it become of increasing value in themselves as representations of nature, and the tendency henceforward for a couple of centuries is to exaggerate their importance so that the general decorative effect becomes subordinate. Giotto's greatness depends on the gift he possessed for holding the balance even among opposed artistic qualities. If he was interesting and convincing as a narrator, he had a fine eye at the same time for composition and balanced his masses with unerring tact. Neither he nor any of the Florentine frescoists had much sense of colour, and at this stage the monastery paintings are of a monotonous quality, and his paintings of light and shade were not thought of, but in line and mass he pleases the eye as much as he satisfies the mind by his clear statement of the meaning and intention of his figures and groups.

In putting these together he is careful above all things to make them tell their story, and primitive as he is in technique he is as accomplished in this art as Raphael himself. Moreover, he holds the balance between the tendency, always so strong among his countrymen as among the Germans, to over-emphasis of action and expression, and the grace and self-restraint which are among the most precious of artistic qualities. He never sacrifices beauty to force, nor on the other hand does he allow his sense of grace of line to weaken the telling effect of action or grouping. A good example of his style, and one interesting also from the comparative standpoint, is his fresco of "Herod's Birthday Feast" in S. Croce at Florence (fig. 15, Plate IV.). We contrast it with the earlier wall-painting of the same subject in the church at Brunswick (fig. 17, Plate III.). Giotto has reduced the number of actors to the minimum necessary for an effective presentation of the scene, but has carried each figure with meaning and presented the ensemble with a due regard for space as well as merely for form. The flatness of the older work has already been exchanged for an effective, if not yet fully correct, rendering of planes. The justice of the actions and expressions will at once strike the observer.

The Florentine school as a whole looks to Giotto as its head, because he embodies all the characteristics that made it great; but at the same time the artists that came after him in most cases failed by over-emphasis of the demonstrative element, and sacrificed beauty and sentiment to vigour and realism. The school as a whole is markedly intellectual, and as a result is at times prosaic, from which fault Giotto himself was saved by his Gothic tenderness and romance. His personality was so outstanding that it dominated the school for nearly a century. The "Giotteschi" is a name given to a number of Florentine painters whose labours cover the rest of the 14th century among whom only one, Andrea di Cione, called Orcagna, lifted himself to any real eminence.

At Siena the Gothic movement made itself felt in the next artistic generation after that of Duccio. Its chief representative was Simone Martini. With him Sienese art takes upon itself a character contrasting markedly with the Florentine. It is on the demonstrative side less intellectual, less vigorous, less secular; and a dreamy melancholy, a tenderness that is a little sentimental, take the place of the alertness and force with which the personages in Florentine frescoes are ended. On the other hand, in decorative feeling, especially in regard to colour, Sienese painting surpasses that of the Florentines. Simone was followed by a number of artists who answered to the Florentine "Giotteschi" and carry on the style through the century, but as Florence produces an Orcagna, so at Siena about the middle of the 14th century there appear in the brothers Lorenzetti two artists of exceptional vigour, who carry art into new fields. Ambrogio Lorenzetti, the younger of the brothers, is specially represented by some frescoes in the Public Palace at Siena of a symbolical and didactic kind, representing Good and Bad Government, from which is selected a figure representing Peace (fig. 14, Plate V.). Sienese sentiment is here very apparent. Simone Martini's masterpiece had been a great religious fresco of an edifying kind on the wall of the chapel, and now in the rooms devoted to the secular business of the city Lorenzetti covers the walls with four large compositions on the subject named.

The painters of the Sienese school were on the whole faithful to the style indicated, and later on in the century they extend the boundaries of their school by spreading its influence into the hill country of Umbria. In the cities of this region Taddeo di Bartoli, one of the best of the followers of Simone, worked about the end of the century, and early Umbrian art in consequence exhibits the same devotional character, the same dreaminess, the same grace and decorative charm, that are at home in Siena.

Elsewhere in Italy the art of the 14th century represents a general advance beyond the old medieval standard, but no outstanding personality made its appearance and there was nothing that can be strictly termed a revival. At Rome, where on the foundation of the noble design of Cavallini there might have been reared a promising artistic structure, the removal early in the 14th century of the papal court to Avignon in France led to a cessation of all effort.

§ 15. The Fifteenth Century, and its Influence on the Development of Painting at Florence.—We come now to what was indicated in § 4 as the third of the main periods into which the history of painting may be divided. It is that in which, by the aid of the new agency of perspective, truth of form was for the first time perfectly mastered, and an advance was made in the rendering of the truth of space.

The opening of the 15th century in Italy is the most important epoch in the whole history of painting, for it was the real beginning of the modern era. Here Florence, the first home of Renaissance culture, undeniably assumes the lead, and the new era is again opened by the agency of an individual of genius. The father of modern painting is the Florentine Masaccio. He not only advanced the art in those qualities in which Giotto had already made it great, but pointed the way towards the representation of the third dimension of objects and of space as a whole which had for so long been almost ignored. His short life course, for he died before he was thirty, only allowed him to execute one work of the first importance, the frescoes in the Brancacci chapel of the Carmine at Florence. There in the "Tribute Money" he told the story with all Giotto's force and directness, but with an added power in the creation of exalted types of human character, and in the presentation of solid shapes that seem to live before us. In the "Expulsion from Eden" he rose to greater heights. In the whole range of demonstrative art no more convincing, more moving, figures have ever been created than those of our first parents, Adam veiling his face in his hands, Eve throwing back her head and wailing aloud in agony, while in the foreshortened form of the angel that hovers above we
discern the whole future development of the art for a century to come (see fig. 15, Plate V.). Above all qualities in Masaccio's work we are impressed with the simplicity and the ease of the work. The youthful artist possessed a reserve of power that, had he lived, would have carried him at one bound to heights that he foreshadowed his actual successors in the school well nigh a century to climb.

The 15th century at Florence presents to us the picture of a progressive advance on the technical side of art, in the course of which various problems were attacked and one by one vanquished, till the form of painting in the style recognized in the school was finally perfected, and was then handed on to the great masters of expression, such as Raphael and Michelangelo, who used it as the obedient instrument of their wills. The efforts of the artists were inspired by a new intellectual and social movement of which this century was the scene. If the Gothic movement in the 14th century had inspired Giotto and Simone Martini, now it was the revived study of the antique, the true Renaissance, that was behind all the technical struggles of the artists. Painting was not, however, directly and immediately affected by the study of antique models. This was only one symptom of a general stir of intellectual life that is called by the apt term "humanism." In the early Gothic epoch the movement had been also in the direction of humanism, that is to say, of softness in manners and of the amenities and graces of life, but it was also a strictly religious movement. Now, in the 15th century, the inspiration of thought was rather pagan than Christian, and men were going back to the ideas and institutions of the antique world as a substitute for those which the Church had provided for thirty generations. The direct influence of these studies on art was chiefly felt in the case of architecture, which they practically transformed. Sculpture was influenced to a lesser degree, and painting least of all. It was not till the century was pretty far advanced that classical subjects of a mythological kind were adopted by artists like Botticelli and Piero di Cosimo, the first figures borrowed from the antique world being those of republican worthies displayed for purposes of public edification.

The elements which the humanistic movement contributed to Florentine art are the following: (1) The scientific study of perspective in all its branches, linear and aerial, including the science of shadows. (2) Anatomy, the study of the nude form both at rest and in action. (3) Truth of fact in details in animate and inanimate subjects. (4) The technique of oil painting. It must be observed that in this work the Florentines were joined by certain painters of Umbria, who were not satisfied with the Umbro-Sienese tradition already spoken of, but allied themselves with the leaders of the advance who were fighting under the banner of Masaccio.

Of the studies mentioned above by far the most important was that of perspective. Anatomy and realism in details only represented an advance along the lines painting had been already following. The new technique of oil painting, though of immense importance in connexion with the art as a whole, affected the Florentines comparatively little. Their favourite form of painting was the mural picture, not the self-contained panel or canvas for which the oil medium was specially designed, and for mural work fresco remained always supreme (see supra, § 35). The introduction of scientific perspective affected something like a transformation. The essence of the work from the decorative point of view had been its flatness. It was primarily pattern-making, and nature had been represented by contours which stood for objects without giving them their full dimensions. When the artist began to introduce varying planes of distance and to gain relief by light and shade, there was at once a change in the relation of the picture to the wall. It no longer agreed in its flatness with the facts of the surface on which it formed the enrichment, but opposed these by its suggestion of depth and distance. Hence while painting as a whole advanced enormously through this effort after the truth of space, yet decorative quality in this particular form of the art proportionately suffered.

The study of perspective owed much to the architect and scholar Brunellesco, one of the oldest as well as ablest of the men in whom the new movement of the 15th century was embodied. Brunellesco taught all he knew to Masaccio, for whose genius he felt true admiration; but the artist in whom the result of the new study is most obvious is Paolo Uccello. He had much power, who was born as early as 1397. Uccello, as extant works testify, sometimes composed pictures mainly with a view to the perspective effects for which they furnished the opportunity. See fig. 16, Plate V., where in a fresco of a cavalry skirmish he has drawn in foreshortened view the figure of a warrior prone on the ground, as well as various weapons and other objects under the feet of the horses. A fresco of "The Flood" at Florence is even more naïve in its parade of the painter's newly won skill in perspective science. The intarsists, or workers in inlaid woods, who were very numerous in Florence, also adopted perspective motives for their designs, and these testify to the fascination of the study during all the last part of the century and the beginning of the next.

The advance in anatomical studies may be illustrated in the person of Antonio Pollaiuolo. Masaccio had been as great in this department of the painter's craft as in any other; and in Adan and Eve of the "Expulsion," and the famous nude shown in the fresco of "Peter Baptizing," he had given the truth of action and expression as few have been able to render it; but in the matter of scientific accuracy in detail more anatomical study was needful, and to this men like Pollaiuolo now devoted themselves. Pollaiuolo's "Martyrdom of St Sebastian," in the London National Gallery, is a very notable illustration of the effects which a conscientious and able Florentine of the period would make to master these problems of the scientific side of art. (See fig. 17, Plate V.)

On the whole, however, of the men of this group it was not a Florentine but the Umbrian Piero de' Franceschi that represents the greatest achievement on the formal side of art. His theoretical studies were profound. He wrote a treatise on perspective, representing an advance on the previous treatment of the science by Alberti; and to this study of linear perspective Piero united those of aerial perspective and the science of shadows. A fresco of his at Arezzo entitled the "Dream of Constantine" is epoch-making in presenting a night effect into the midst of which a bolt of celestial radiance is hurled, the incidence of which on the objects of the various planes of the picture has been carefully observed and accurately reproduced. (See fig. 18, Plate V.)

Piero handed on his scientific accomplishments to a pupil, also an Umbrian of Florentine sympathies, Luca Signorelli of Cortona. He achieved still greater success than Pollaiuolo in the rendering of the nude form in action, but more conspicuously than any others of this group he sacrificed beauty to truth, and the nudes in his great series of frescoes on the Last Things at Orvieto are anatomized like écorchés, and are in colour and texture positively repellent. Luca's work is, however, of historical importance as leading on to that of Michelangelo.

A great power in the Florentine school of the 15th century was Andrea del Castagno, an artist with much of the vigour, the feeling for the monumental, of Masaccio, but without Masaccio's saving gift of suavity of treatment. He is best represented by several figures representing Florentine worthies, whom he has painted as if they were statues in niches. They formed part of the decoration of a villa, and are noteworthy as wholly secular in subject. There is a massiveness about the forms which shows how thoroughly the 15th century Florentines were mastering the representation of solid objects in all their three dimensions. Other painters attracted attention at the time for their realistic treatment of details. Vasari singles out Alessio Baldovinetti.

The importance for art of the Florentine school of the 15th century resides in these efforts for the perfecting of painting on the formal side, which its representatives were themselves making and were inspiring in others. The general historian of the art will dwell rather on this aspect of the work of the school than on the numerous attractive features it offers to the

superficial observer. The Fra Angelicos, the Filippo Lippi, the Benozzo Gozzoli, the Botticelli, the Filippino Lippi of the century express pleasantly in their work various phases of feeling, devotional, idyllic or pensive, and enjoy a proportionate popularity among the lovers of pictures. Exigencies of space preclude anything more than a mention of their names, but a sentence or two must be given to a painter of the last half of the century who represents better than any other the perfection of the monumental style in fresco painting. This painter is Ghirlandajo, to whom is ascribed a characteristic saying. When disturbed in hours of work about some domestic affair he exclaimed: “Trouble me not about these household matters; now that I begin to comprehend the method of this art I would fain they gave me to paint the whole circuit of the walls of Florence with stories.” Ghirlandajo was entering into the heritage of technical knowledge and skill that had been laboriously acquired by his countrymen and their Umbrian comrades since the beginning of the century, and he spread himself upon the plastered walls of Tuscan churches with easy copiousness, in works which give us a better idea than any others of the time of how much can be accomplished in a form of art of the kind by sound tradition and a businesslike approach. He had brought some of his best work to Padua in the earliest years of the 14th century, but his influence had not lasted. Florentine art, in the more advanced form it wore in the first half of the 15th century, was again brought to it by Donatello and Paolo Uccello, who were at work there shortly before 1450. At that time Andrea Mantegna was receiving his first education from a painter, or rather impresario, named Francesco Squarcione, who directed his attention to antique models. Mantegna learnt from Donatello a statuesque feeling for form, and from Uccello a scientific interest in perspective, while, acting on the stimulus of his first teacher, he devoted himself to personal study of the remains of antique sculpture which were common in the Roman cities of north Italy. Mantegna built up his art on a scientific basis, but he knew how to inspire the form with a soul. His own personality was one of the strongest that we meet with in the annals of Italian art, and he stamped this on all he accomplished. No figures stand more firmly than Mantegna’s; none have a more plastic fullness, in none are details of accoutrement or folds of drapery more clearly seen. The Florentines, on the contrary, remain supplied with a store of classical details that he uses with extraordinary accuracy and effectiveness in his representations of a Roman triumph, at Hampton Court. Ancient art invested, too, with a certain austere beauty his forms of women or children, and in classical nudes there is a firmness of modelling, a suppleness in movement, that we look for in vain among the Florentines. There, Plate VI, which shows a dance of the Muses with Venus and Vulcan, is typical. Mantegna was not only a great personality, but he exercised a powerful and wide-reaching influence upon all the art of northern Italy, including that of Venice. His perspective studies led him in the same direction as Melozzo da Forli, and in some decorative paintings in the Camera degli Sposi at Mantua he pointed out the way that was afterwards to be followed by Correggio.

Mantegna’s relations with the school of Venice introduce us to the most important and interesting of all the Italian schools save that of Florence. Venetian painting occupies a position by itself that corresponds with the place and history of the city that gave it birth. The connections of Venice were not with the rest of Italy, but rather with the East and with Germany. Commercially speaking, she was the emporium of trade with both. Into her markets streamed the wealth of the Orient, and from her markets this was transferred across the Alps to cities like Nuremberg. From Germany had come a certain Gothic element into Venetian architecture in the 14th century, and a little later an influence of the same kind began to affect Venetian painting. Up to that time Venice had depended for her painters on the East, and had imported Byzantine Madonna pictures, and called in Byzantine mosaic-workers to adorn the walls and roof of her metropolitan church. The first sign of native activity is to be found at Murano, where,
PAINTING

in the first half of the 15th century, a German, Justus of Allemagna, worked in partnership with a Murinese family. A little later a stranger from another quarter executes important commissions in the city of the lagoons. This was an Umbrian, Gentile da Fabriano, who possessed the suavity and tenderness of his school.

The natural tendency of Venetian taste, nourished for centuries on opulent Oriental stuffs, on gold and gems, ran in the direction of what was soft and pleasing to the sense. The northern Gothic and the Umbrian influences corresponded with this and flattered the natural tendency of the people. For the proper development of Venetian painting some element of Florentine strength and science was absolutely necessary, and this was imparted to the Venetian school by Mantegna through the medium of the Belli.

The Belli were a Venetian family of painters, of whom the father was originally an assistant to Gentile da Fabriano, but lived for a while at Padua, where his daughter Nicolosia became the wife of Mantegna. With the two Belli sons, Gentile and Giovanni, Mantegna became very intimate, and a mutual influence was exercised that was greatly to the benefit of all. Mantegna softened a little what has been termed his "iron style," through the assimilation of some of the suavity and feeling for beauty and luminosity and engraving. Art, as the son of the other hand Mantegna imparted some of his own sternness and his Florentine science to his brothers-in-law, of whom the younger, Giovanni, was the formative master of the later Venetian school.

§ 17. The Painting of the Sixteenth Century: The Mastery of Form.—If we examine a drawing of the human figure by Raphael, Michelangelo, or Correggio, and compare it with the finest examples of Greek figure design on the vases, we note at once that to the ancient artist the form presented itself as a silhouette, and he had to put constraint on himself to realize its depth; whereas the moderns, so to say, think in the third dimension of space and every touch of their pencil presupposes it. The lovely "Aphrodite riding on a Swan," on the large Greek kylix in the British Museum, is posed in an impossible position between the wing of the creature and its body, where there would be no space for her to sit. The lines of her figure are exquisite, but she is pure contour, not form. In a Raphael nude the strokes of the chalk come forward from the back, bringing with them into relief the rounded limb which grows into plastic fullness before our eyes. Whether the parts recede or advance from side to side, the impression on the eye is equally clear and convincing. The lines do not merely limit a surface but caress the shape and model it by their very direction and comparative force into relief. In other words, these 16th-century masters for the first time perfectly realize the aim which was before the eyes of the Greeks; and Raphael, who in grace and truth and composition may have been only the peer of Apelles, probably surpassed his great predecessor in this easy and instinctive rendering of objects in their solidity.

In so far as the work of these masters of the culminating period, in its relation to nature, is of character this need no further analysis, and attention should rather be directed to those elements in Italian design of the 16th-century which have a special interest for the after development of the art.

Not only was form mastered as a matter of drawing, but relief was indicated by a subtle treatment of light and shade. Foreshortening as a matter of drawing requires to be accompanied by correct modulation of tone and colour, for, as the form in question recedes from the eye, changes of the most delicate kind are experienced and due to these the impression is lost for record and reproduction. The artist who first achieved mastery in these refinements of chiaroscuro was Leonardo da Vinci, while Correggio as a colourist added to Leonardesque modelling an equally delicate rendering of the modulation of local colour in relation to the incidence of light, and the greater or lesser distance of each part from the eye. This represented a great advance in the rendering of natural truth, and prepared the way for the masters of the 17th century. It is not only by linear perspective, or the progressive diminution in size of objects as they recede, that the effect of space and distance can be compassed. This depends more on what artists know as "tone" or "values," that is, on the gradual degradation of the intensity of light and shadow, and the diminishing saturation of colours, or, as we may express it in a word that is not however quite adequate, aerial perspective. That which Leonardo and Correggio had accomplished in the modelling, lighting and tinting of the single form in space had to be applied by succeeding artists to space as a whole, and this was the work not of the 16th but of the 17th century, and not of Italians but of the masters of the Netherlands and of Spain.

§ 18. The Contribution of Venice.—Before we enter upon this fourth period of the development of the art, something must be said of an important contribution that painting owes to the masters of Venice.

The reference is not only to Venetian colouring. This was partly, as we have seen, the result of the temperament and circumstances of the people, and we may ascribe also to the peculiar position of the city another Venetian characteristic. There is at Venice a sense of openness and space, and the artists seem anxious on their canvases to convey the same impression of a large entourage. The landscape background, which we have hitherto considered as a finishing panel, becomes a feature of the pictures of the Venetians, here and there, the detail of the Flemings and treat their spaces in a broader and simpler fashion. An indispensable condition however for the rich and varied effects of colour shown on Venetian canvases was the possession by the painters of an adequate technique. In the third part of this article an account is given of the change in technical methods due, not so much to the introduction of the oil medium by the Van Eycks, as to the exploitation at Venice of the unsuspected resources which that medium could be made to afford. Giovanni Bellini, not Hubert van Eyck, is really the primal painter in oil, because he was the first to manipulate it with freedom, and to play off against each other, the various effects of opaque and transparent pigment. His noble picture at Murano, representing the Doge Barbarigo adoring the Madonna, represents his art at its best (see fig. 21, Plate VI.). Bellini rendered possible the painters of the culminating period of Venetian art, Giorgione, Titian, Tintoretto, with others hardly less great. Giorgione was the first who made the art, as an art of paint not merely of design, speak to the soul. His motive is the idea and the composition; he touches that wae the piece to life; his glowing human and the purely neutral, the repose and quality; the intimate appeal of his dreamy faces, his refined but voluptuous forms, and the large freedom of his spaces of sky and distance, all combine to impress us with a sense of the poetry and mystery of creation that we derive from the works of no other extant painter. The "Concert" of the Louvre, fig. 22, Plate VII. is typically Giorgionesque.

Tintoretto, more intellectually profound, more passionate, writes for us his message in his stormy brush-strokes, now shaking us with terror, now lifting our souls on the wings of his imagination; but with him as with the younger master it is always the painter who speaks, and always in the terms of colour and texture and handling. Lastly, between the two, unapproachable in his majestic calm, stands Titian. Combining the poetry of Giorgione with much of Tintoretto's depth and passion, he is the first, and still perhaps the greatest, of the supreme masters of the painter's art. His masterpiece is the great "Presentation" of the Venice Academy, fig. 23, Plate VII. Painting, it is true, has to advance in its development from the idea to the execution with the aid of the Flemish panel, but it loses on the ethical side more than on the technical side it wins, and without the Venetians the world would have never known the full possibilities of the art that began so simply and at so early a stage of human civilization.

§ 19. The Fourth Period: The Realization of the Truth of Space. Changed Relation of Painting to Nature.—By the 17th century the development of painting had passed through all its stages, and the picture was no longer a mere silhouette or a transcript
PAINTING

DEVELOPMENT]

of objects against a flat background, but rather an enchanted mirror of the world, in which might be reflected space beyond space, infinite vision. With this transformation of the picture there was connected a complete change in the relation of the artist to nature. Throughout all the earlier epochs of the art that painter had concerned himself not with nature as a whole, but with certain selected aspects of nature that furnished him with his recognized subjects. These subjects were selected on account of their intrinsic beauty or importance, and as representing intrinsic worth they claimed to be delineated in the clearest and most substantial fashion. In the 17th century, not only was the world as a whole brought within the artist's view, but it presented itself as worthy in every part of his most reverent attention. In other words the art of the 17th century, and of the modern epoch in general, is democratic, and refuses to acknowledge that difference in artistic value among the aspects of nature which was at the basis of the essentially aristocratic art of the Greeks and Italians. It does not follow that selection is of any less importance in modern painting than it was of old; the change is that the basis of selection is not now a fixed intrinsic gradation amongst objects, but rather a variable difference dependent not on the object itself but on certain accidents of its position and lighting. The artist still demands that nature shall inspire him with her beauty, but he has learned that this beauty is so widely diffused that he may find it anywhere. It was a profound saying of John Constable that there is nothing ugly in nature, for, as he explained it, let the actual form and character of an object be what it would, the angle at which it might be viewed, and the effect upon it of light and colour, could always make it beautiful. It is when objects and groups of objects have taken on themselves this pictorial beauty, which only the artistically trained eye can discern, that the modern painter finds himself in the presence of his "subject," and he knows that this magical play of beauty may appear in the most casual and unlikely places, the moon and squalid corners of ordinary objects of daily use. Sometimes it will be a heap of litter, sometimes a maiden's face, that will be touched with this pictorial charm. Things to the common eye most beautiful may be barren of it, while it may touch and glorify a clood.

The artist who was the first to demonstrate convincingly this principle of modern painting was Rembrandt. With Rembrandt the actual intrinsic character of the object before him was of small concern. Beauty was with him a matter of surface effect that depended on the combined influence of the actual local colour and superficial modelling of objects, with the passing condition of their lighting, and the greater or less clearness of the air through which they were seen. Behind the effect produced in this fortuitous fashion the object in itself vanished, so to say, from view. It was appearance that was important, not reality. Rembrandt's art was related essentially not to things as they were but as they seemed. The artist of modern times, the most careful delineation of objects gives them the title of the earliest realists, portrayed these objects in precise analytical fashion each for itself. More advanced painters regarded them not only in themselves but in their artistic relations as combining beauties of form and colour that together made up a pictorial effect. Rembrandt in his later work attended to the pictorial effect alone and practically annulled the objects, by reducing them to pure tone and colour. Things are not there at all, but only the semblance or effect or "impression" of things. Breadth is in this way combined with the most delicate variety, and a new form of painting, now called "impressionism," has come into being.

To give back nature just as she is seen, in a purely pictorial aspect, is the final achievement of the painter's craft, but as the differences of tone and colour on which pictorial beauty depends are extremely subtle, so it is only by a skill of touch that seems like the most accomplished sleight of hand that the required illusion can be produced, and in this way the actual handling of the brush assumes in modern painting an importance which in the old days it never possessed. The effect is produced not by definite statements of form and colour, but by what Sir Charles Eastlake termed "the judicious unfinished of a consummate workman," through which "the flat surface is transformed into space." Frans Hals of Haarlem, who was born in 1580, was perhaps the first to reveal the artistic possibilities of a free suggestive handling in oil paint, and Van Dyck is said to have marvelled how Hals was able to sketch in a portrait with single strokes of the brush, each in the right place, without altering them and without fusing them together. In the wonderful late Velasquez at Vienna, the portrait of the Infant Philipp Prosper as a child of two years old, the white drapery, the minute fingers, the delicate baby face from which look great eyes of darkest blue, are all indicated with touches so loosely thrown upon the canvas that seen near by they are all confusion—yet the life and truth are in them, and at the proper focal distance nature herself is before us. The touches combine to give the forms, the local colours, the depth, the solidity of nature, while at the same time the chief impression they convey is that of the opalescent play of changing tones and hues which, eluding the limitations of definite contours, make up to the painter's eye the chief beauty of the external world. Moreover it will be understood that this realization of the truth of space, which is the distinguishing quality of modern painting, does not mean that the artist is always to be rendering large views of sky and plain. The gift of setting objects in space, so that the atmosphere plays about them, and their relations of tone to their surroundings are absolutely correct and convincing, is shown just as well in a group of things close at hand as in a wide landscape. The backgrounds in the pictures by Velasquez of "The Surrender of Breda" and "Don Balthazar Carlos" at Madrid are magnificent in their limitless suggestion of the free spaces of earth and sky, but the artist's power in this respect is just as effectively shown in the creation of space in the interiors of "The Maids of Honour" and the "Spinners," and the skill with which he brings the most ordinary of common objects, the sitter from his white robe, in the "Innocent X." of the Doria Palace at Rome. The fact is that the scale on which the modern painter works, and the nature of his subjects, make no difference in the essential character of the result. A very few square feet of canvas were sufficient for Ruysdael to convey in his "Haarlem from the Dunes" the most sublime impression of infinity; and a Dutch interior by De Hooch gives us just as much feeling of air and distance as one of the vast panoramic landscapes of De Koning or Rubens.

§ 20. Impressionism.—The term "impressionism," much heard in artistic discussions of to-day, is said to date from a certain exhibition in Paris in 1871, in the catalogue of which the word was often used; a picture being called Impression de mon potine, or Impression d'un chat qui se promène, &c. An influential critic summed up these impressions, and dubbed the exhibition "Salon des Impressionistes" (Muther, Modern French Art, 1896, ii. 781). The most charitable hope to suppose that the style of painting denoted by this term is an invention of the day, for, in so far as it is practised and with adequate artistic powers, it is essentially the same style as that of some of the greatest 17th-century masters, such as Rembrandt and Velasquez. Modern investigation into the reasons of things has provided the system with a scientific basis and justification, and we can see that it really corresponds with the experimentally determined facts of human vision. The act of "seeing" may mean one or two different things. We may (1) allow our glance to travel leisurely over the field of vision, viewing the objects one by one, and forming a clear picture to ourselves of each in turn; or (2) we may try to take in the whole field of vision at a glance, ignoring the special objects and trying to frame before ourselves a sort of summary representation of the whole; or again, (3) we may choose a single point in the field of vision, and focus on that with our attention, allowing the surrounding objects to group themselves in an indistinct general mass. We can look at in any one of these three ways; each is as legitimate as the others; but since in most ordinary cases we look at things in order to gain information about them, our vision is usually of the first or
PAINTING

from the serious and beautiful art of Watteau (fig. 24, Plate VIII.) to the slighter productions of a Fragonard. Van Dyck, another Fleming of genius, is largely responsible for the British portraiture of the 18th century, which is affiliated to him through Kneller and Sir Peter Lely. There is something of the courtly elegance of Van Dyck in the beautiful Gainsborough at Edinburgh representing the Hon. Mrs Graham (fig. 25, Plate VIII.). On the whole, though the representative masters of these two schools are original, or at any rate personal, in technique, they are in their attitude towards nature largely dependent on the traditions established in the great Italian schools of figure-painting of the 16th century. The contrast when we turn from France and Flanders to Holland is extraordinary. This country produced at the close of the 16th century and in the first half of the 17th a body of painters who owed no direct debt at all to Italy, and, so far as appears, would have been what they were had Titian and Raphael and Michelangelo never existed. They took advantage, it is true, of the mastery over nature and over the material apparatus of painting which had been won for the world by the Italians of the 15th and 16th centuries, but there their debt to the peninsula ended, and in their outlook upon nature they were entirely original.

The Dutch school is indeed an epitome of the art in its modern phase, and all that has been said of this applies with special force to the work of the 17th century. Democratic in choice of subject, subtle in observation of tone and atmosphere, refined in colour, free and yet precise in execution, sensitive to every charm of texture and handling, the Dutch painter of the first half of the 17th century represents the most varied and the most finished accomplishment in paint that any school can show. Such work as he perfected could not fail to exercise a powerful effect on later art, and accordingly we find a current of influence flowing from Holland through the whole course of modern painting, side by side with the more copious tide that had its fountain-head in Italy. Hogarth and Chardin and Morland in the 18th century, the Norwich painters and Constable in the 19th, with the French Barbizon landscapists who look to the last as their head, all owe an incalculable debt to the sincere and simple but masterly art of the countrymen of Rembrandt.

§ 21. Painting in the Modern Schools.—The history of the art has been presented here as an evolution, the ultimate outcome of which was the impressionist painting of 17th-century masters such as Rembrandt and Velazquez. In this form of painting the artist is only concerned with those aspects of nature which give him the sense of pictorial beauty in tone and colour, and these aspects he reproduces on his canvas, not as a mere mirror would, but touched, pervaded, transfigured by his own artistic personality. It does not follow however that these particular ideals of the art have inspired modern painters as a body. No one who visits the picture exhibitions of the day, or even our galleries of older art, will fail to note that a good deal of modern painting since the 17th century has been academic and conventional, or prosaically natural, or merely popular in its appeal. With work of this kind we are not concerned, and the following pages (Vol. II) will take up these matters. In this article, the names with few exceptions are those of artists who embody the matureer pictorial aims that have been under discussion.

Of the schools of the 17th century that of Spain, owing much to the so-called Italian "naturalists," produced the incomparable Velazquez with one or two notable contemporaries, and later on in the 18th century the interesting figure of Goya; while the influence of Velazquez on Whistler and other painters of to-day is a more important fact connected with the school than the recent appearance in it of brilliant technical executants such asFortuny.

The schools of Flanders and of France are closely connected, and both owe much to Italian influence. The land of Italy, rather than any works of Italian painters, has been the inspiration of the so-called classical landscapists, among whom the Lorrain, Claude and the French Poussin take the rank of captains of a goodly band of followers. In figure painting the Venetians inspire Rubens, and Raphael stands at the head of the academic draughtsmen and composers of "historical" pieces who have been especially numerous in France. Rubens, Velasquez and Rembrandt together formed Le Brun in the days of Louis XIV., David and Delaroche in the two succeeding centuries, and the modern decorative figure painters, such as Baudry, whose works adorn the public buildings of France. Flemish influence is also strong in the French painting in a gallant vein of the 18th century.
PAINTING

The origin of Animal Painting is to be sought partly in figure-pieces, where, as in Egypt and Assyria, animals play a part in scenes of human life, and partly in landscapes, in which cattle, &c., are introduced to enliven the foreground. The Hunting Picture, combining a treatment of figures and animals in action with landscape of a picturesque character, gives an artist like Rubens a welcome opportunity, and the picture of Dead Game may be regarded as its offshoot. This brings us to the important class of Still-Life Painting, the relation of which to the figure-piece can be traced through the genre picture and the portrait. As a natural scene in the background, so on the nearer planes, a judiciously chosen group of accessory objects adds life and interest to the representation of a personage or scene from human life. Later on these objects, when regarded with the eyes of an artist fully opened to the beauty of the world, become in themselves fit for artistic, eye, even ideal, treatment; and a Vollen will by the magic of his art make the interior of a large and polished copper caldron look as grand as if it were the very vault of heaven itself.

§ 23. Portraiture.—Attention has already been called in § 7 to the skill of the Egyptian artist in marking differences of species and race in animals and men. In the case of personages of special distinction, notably kings, individual lineaments were portrayed with the same freshness, the same truth. These were portraits of their power among the artists of Assyria. The realism of Cretan and Mycenean art is so striking that we should expect to find portraiture represented among its remains, and this term may be fairly applied to the gold masks that covered the faces of bodies in the tombs opened by Dr Schliemann. In early (historical) Greek art some archaic vases show representations of named personages of the day, such as King Arkesilas of Cyrene, that may fall under the same heading, and portraiture was no doubt attempted in the early painted tomstones. The ideal character of Greek art however kept portraiture in the background till the later period after Alexander the Great, whose effigy limned by Apelles was one of the most famous pictures in antiquity. Our collections of works of classical art have been recently enriched by a series of actual painted portraits of men and women of the late classical period, executed on mummy cases in Egypt, and discovered in Graeco-Egyptian cemeteries. An attempt has been made by comparison with coins to identify some of the personages represented with members of the Ptolemaic house, including the famous Cleopatra, but it is safer to regard them, with Flinders Petrie, as portraits of ordinary men and women of the earliest centuries A.D. Technically they are of the highest order, as will be noticed in § 26. From the artistic point of view one notes their variety, their life-like character, and the pleasing impression of the human personality which some of them afford. There are specimens in the London National Gallery and British Museum.

During the early Christian and early medieval periods portraits always existed. The effigies of rulers appeared, for example, on their coins, and there are some credible attempts at portraiture on Anglo-Saxon pieces of money. In painting we find the most continuous series in the illuminated MSS. where they occur in the so-called dedicatory pictures, in MSS. intended for royal or distinguished persons, where the patron is shown seated in state and perhaps receiving the volume. The object here, as Woltmann says, "always appears to be to give a true portrait of the exalted personage himself" (Hist. of Painting, Eng. trans., i. 212). Julia Anicia, granddaughter of Valentinus III., in the 6th century; the Carolingian emperor, Lothair, in the 9th; the Byzantine emperors, Basili II. in the 10th, and Nikephoros Botanites in the 11th, &c., appear in this fashion. Some famous mosaic pictures in S. Vitale, Ravenna, contain effigies of Justinian, Theodora, and the Ravennese bishop, Maximin. In very many medieval works of art a small portrait of the donor or the artist makes its appearance as an accessory.

With the rise of schools of painting in the 14th and 15th centuries, especially in the north, the portrait begins to assume greater prominence. The living personage of the day not only figures as donor, but takes his place in the picture itself as one of the actors in the sacred or historical scene which is portrayed. A good deal of misplaced ingenuity has been expended in older and more modern days in identifying by guess-work historical figures in old pictures, but there is no doubt that such were often introduced. Dante and some of his famous contemporaries make their appearance in a fresco ascribed to Giotto in the chapel of the Bargello at Florence. One is willing to see the face and form of the great Masaccio in the St. Thomas with the red cloak, on the right of the group, in the fresco of the Tribute Money (see § 15). Dürer certainly paints himself as one of the Magi in his picture in the Uffizi. In Italy Ghirlandajio (see § 15) carried to an extreme this fashion, and thereby unduly secularized his biblical representations. The portrait proper, as an independent artistic creation, comes into vogue in the course of the 15th century north and south of the Alps, and Jan van Eyck, Memlinct, and Dürer are in this department in advance of the Florentines, for whereas the latter almost confine themselves to flat profiles, Van Eyck introduces the three-quarter face view, which represents an improvement in the rendering of form. Mantegna and Antonello da Messina portray with great firmness, and to Uccello is ascribed an interesting series of heads of his contemporaries. It is Gentile and Giovanni Bellini however who may be regarded as the fathers of modern portrait painting. Their work is always characterized by the warmth and restraint of the Italian, and Venetian portraits were abundant. Those by Gentile Bellini of the Sultan Mahomet II., and by Giovanni of the Doge Loreldano are especially famous. Vasari in his notice of the Bellini says that the Venetian palaces were full of family portraits going back sometimes to the fourth generation. Some of the finest portraits in the world are the work of the great Venetians of the 16th century, for they combine pictorial quality with an air of easy greatness which later painters find it hard to impart to their creations. Though greatly damaged, Titian's equestrian portrait of Charles V. at Madrid (fig. 26, Plate VIII.) is one of the very finest of existing works of the kind. It is somewhat remarkable that of the other Italian painters who executed portraits the most successful was the idealist Raphael, whose papal portraits of Julius II. and Leo X. are masterpieces of firm and accurate delineation. Leonardo's "Monna Lisa" is a study rather than a portrait proper.

The realistic vein, which, as we have seen, runs through northern painting, explains to some extent the extraordinary merit in portraiture of Holbein, who represents the culmination of the efforts in this direction of masters like Jan van Eyck and the Van Loo family. Holbein's portraits are models of delicacy, and one he never lived, and in many of his portraits he not only presents his sitter in life-like fashion, but he surrounds him with accessory objects, painted in an analytical spirit, but with a truthfulness that has seldom been equalled. The portrait of Georg Gysis at Berlin represents this side of Holbein's art at its best (fig. 27, Plate VIII.). Some fine portraits by Italianizing Flemings such as Antonio Moro (see Table I.) bring us to the notable masters in portraiture of the 17th century. All the schools of the period were great in this phase of the art, but it flourishcd more especially in Holland, where political events had developed in the people self-reliance and a strong sense of individuality. As a consequence the Dutch men and women of the period from about 1575 to 1675 were incessantly having their portraits painted, either singly or in groups. The so-called "corporation picture" was a feature of the times. This had for its subject some group of individuals associated as members of a company or board or military mess. Such works are almost incredibly numerous in Holland, and their artistic evolution is interesting to trace. The earlier ones of the 16th century are merely collections of single portraits each treated for itself, the link of connexion between the various members of the group being quite arbitrary. Later on efforts, that were ultimately successful, were made to group the portraits into a single composition so that the picture became an artistic whole. Frans Hals of Haarlem, one of the most brilliant painters of the impressionist school that he did much to found, achieved remarkable success in the artistic
grouping of a number of portraits, so that each should have the desired prominence while yet the effect of the whole was that of a unity. His masterpieces in this department in the town-hall of Haarlem have never been equalled.

As portraitists the other great 17th-century masters fall into two sets, Rembrandt and Velazquez contrasting with Rubens and his pupil Van Dyck. The portraits of the two former are individualized studies in which the sitter has been envisaged in an artistic aspect, retaining his personality though sublimated to a harmonious display of tone and colour. The Flemings are more conventional, and representing rather the type than the individual, are disposed to sacrifice the individuality of the sitter to their predetermined scheme of beauty. Both Velazquez and Rubens have left portraits of Isabel de Bourbon, first wife of Philip IV. of Spain, but whereas the Spanishier's version gives us an uncomely face but one full of character, that of the Flemings shows us merely the big-eyed buxom wench we are accustomed to meet on all his canvases. Rembrandt was much less careful than Velazquez or Holbein or Hals to preserve the individuality of the sitter. He did not however, like the Flemings, conventionalize the types, or insist on tint, tone, colour and texture, in the course of which he might deal somewhat cavalierly with the actual facts of the piece of nature before him. The result, though incomparable in its artistic strength, may sometimes, in comparison with a Velazquez, seem laboured, but there is one Rembrandt portrait, that of Jan Six at Amsterdam, that is painted as directly as a Hals, and with the subtlety of a Velazquez, while it possesses a richness of pictorial quality in which Rembrandt surpasses all his ancient or modern compeers (see fig. 28, Plate IX.).

In the 18th century, though France produced some good limners and Spain Goya, yet on the whole England was the home of the best portraiture. Van Dyck had been in the service of Charles I., and foreign representatives of his style carried on afterwards the tradition of his essentially courtly art, but there existed at the same time a line of native British portraitists of whom the latest and best was Hogarth. One special form of portraiture, the miniature (q.v.), has been characteristically English throughout. The greater English and Scottish portraitists of the latter part of the 18th century, headed by Reynolds, owed much to Van Dyck, and their work was of a pronounced pictorial character. Every portrait, that is to say, was before everything beautiful as a work of art. Detail, either of features or dress, was not insisted on; and the effort was rather to generalize than to accentuate characteristic points. In a word, while the artist recognized the claims of the facts before him to adequate portrayal, he endeavoured to fuse all the elements of the piece into one lovely artistic unity, and in so doing he secured in his work the predominant quality of breadth. This style, handed on to painters of less power, died out in the first half of the 19th century in attenuated productions, in which harmony became emptiness. To this has succeeded in Britain, still the home of the best European portraiture, a more modern style, the decadence into of an earlier study of truth and force. While the older school was seen at its best when dealing with the softer forms of the female sex, and of youth, these moderns excelled in the delineation of character in strongly-marked male heads, and some of them could hardly succeed with a woman's portrait. The fine appreciation of character in portraiture shown by Sir John Watson Gordon around the middle of the 19th century marked the beginning of this forcible style of the later Victorian period, a style suited to an age of keen intellectual activity, of science and of matter-of-fact. More recently still, with the rapid development in certain circles of a taste for the life of fashion and pleasure, the portrait of the showily-dressed lady has come again into vogue, and if any special influence is here to be discerned it may be traced to Paris.

§ 24. Genre Painting. The term "genre" is elliptical—it stands for genre bas, and means the "low style," or the style in which there is no grandeur of subject or scale. A genre piece is a picture of a scene of ordinary human life without any religious or historical significance, and though it makes its appearance earlier, it was in the Netherland schools of the first half of the 17th century that it was established as a canonical form of the art. In Egypt we have seen that the subjects from human life have almost always a quasi-religious character, and the earliest examples of genre may be certain designs on early black-figured vases of the 6th century B.C. in Greece. Genre painting proper was introduced at a later period in Greece, and attracted special attention because of its contrast to the general spirit of classical art. It had a special name about which there is some difficulty but which seems to denote the same as genre bas. In early Christian and early medieval painting genre can hardly be recognized, but it makes its appearance in some of the later illuminated MSS. and becomes more common, especially north of the Alps, in the 15th century. It really begins in the treatment in a secular spirit of scenes from the sacred story. These scenes, in Italy, but still more among the prosaic artists of the north, were made more life-like and interesting when they were furnished with personages and accessories drawn from the present world. Real people of the day were as we have just seen introduced as portraits of the grand events, and in the same way all the objects and accessories in the picture were portrayed from existing models. It was easy sometimes for the spectator to forget that he was looking at biblical characters and at saints and to take the scene from the standpoint of actuality. Rembrandt, one of whose chief titles to fame is derived from his religious pictures, often treats a Holy Family as if it were a mere domestic group of his own day. It was a change sure to come when the religious significance was abandoned, and the persons and objects reduced to the terms of ordinary life. This of course represented a break with a very long established tradition, and it was only by degrees, and in Germany and Flanders rather than in Italy, that the change was brought about. Thus for example, St. Elig, the patron of goldsmiths, might be portrayed as saint, but also as artificer with the impediments of the craft about him. The next stage, represented by a charming picture by Quintin Matsys at Paris, shows us a goldsmith, no longer a saint, but busy with the same picturesque accessories (fig. 29, Plate IX.). He has however his wife by his side and she is reading a missal which preserves to the piece a faint religious odour. Afterwards all religious suggestion is dropped, and we have the familiar goldsmith or money changer in his everyday surroundings, of which northern painting has furnished us with so many examples.

Genre painting, however, is something a little more special than is here implied. The term must not be made to cover all figure-pieces from ordinary life. There are pictures by the late Italian "naturalists" of this kind; Caravaggio's "Card Players" at Dresden is a familiar example. These are too large in scale to come under this heading, and the same applies to the bodeges or pictures of kitchens and shops full of pots and pans and eatables, which, largely influenced the Dutch school, and was not particularly popular in Spain in the early days of Velazquez. Nor again are the large and showy subject pictures, which constitute the popular items in the catalogues of Burlington House and the Salon, to be classed as "genre." The genre picture, as represented by its acknowledged masters, is small in scale, as suits the nature of its subject, but is studied in every part and finished with the most fastidious care. The particular incident or phase of life portrayed is as a rule of little intrinsic importance, and only serves to bring figures together with some variety of pose and expression and to motive their surroundings. It is rarely that the masters of genre charge their pictures with satiric or didactic purpose. Jan Steen in Holland and Hogarth in England are the exceptions that prove the rule. The interest is in the main an artistic one, and depends on the nice observance of relations of tone and colour, and a free and yet at the same time precise touch. All these qualities combine to lend to the typical genre picture an intimité, a sympathetic charm, that gives the masters of the style a firm hold on our affections. Probably the most

excellent painters of genre are Terborch, Metsu and Brouwer, the two first painters of the life of the upper classes, the last of peasant existence in some of its most unlovely aspects. The pictures of Brouwer are among the most instructive documents of modern painting. They are all small pictures and nearly all exhibit nothing but two or three boors drinking, fighting, or otherwise characteristically employed, but the artist’s feeling for colour and tone, and above all his inimitable touch, has raised each to the rank of a masterpiece. He is best represented in the Munich Pinacothek, from which has been selected fig. 30, Plate IX. Hardy less admirable are Teniers in Flanders; De Hooch, Ver Meer of Delft, Jan Steen, A. van Ostade, in Holland, while in more modern times Hogarth, Chardin, Sir David Wilkie, Meissonier, and a host of others carry the tradition of the work down to our own day (see Table VIII). Greuze may have the doubtful honour of having invented the sentimental figure-piece from ordinary life that delights the non-artistic spectator in our modern exhibitions.

§ 25. Landscape and Marine Painting. This is one of the most important and interesting of the forms of painting that belong especially to modern times. It is true that there is sufficient landscape in ancient art to furnish matter for a sub- 

stance (Woermann, Die Landschaft in der Malerei der alt. Völker, Munich, 1848, 1849), and that the reminiscences of Pompeian and Roman wall-painting contain a very fair proportion of works that may be brought under this heading. By far the most important examples are the half-dozen or so of pictures forming a series of illustrations of the Odyssey, that were found on the Esquiline at Rome in 1848, and are now in the Vatican library. As we shall see it to be the case with the landscapes of the late medieval period, these have all figure subjects on the nearer planes to which the landscape proper forms a background, but the latter is far more important than the figures. In some of these Odyssey landscapes there is a feeling after space and atmospheric effect, and in a few cases an almost modern treatment of light and shade, which give the works a prominent place among ancient productions which seem to prefigure the later developments of the art. In the rendering of landscape detail, especially in the matter of trees, nothing in antique art equals the pictures of a garden painted on the four walls of a room in the villa of Livia at Prima Porta near Rome. They are reproduced in Antike Denkmäler (Berlin, 1857, &c.). These may be the actual work of a painter of the Augustan age named Ludovico, who is supposed by Pliny and the romancers of Pompeian and Roman wall-painting to have introduced a style of wall-decoration in which “villas, harbours, landscape, gardens, sacred groves, woods, hills, fish-ponds, straits, streams and shores, any scene in short that took his fancy” were depicted in lively and facile fashion. Pompeian wall-paintings exhibit many pieces of the kind, and we find the same style illustrated in the low reliefs in modelled stucco, of which the specimens found near the Villa Farnesina, and now in the Terme Museum at Rome, are the best known.

In medieval painting landscape was practically reduced to a few typical objects, buildings, rocks, trees, clouds, &c., which stood for natural scenery. Occasionally however in the MSS. these objects are grouped in pictorial fashion, as in a Byzantine Psalter of the 10th century in the National Library at Paris. The beginning of the 15th century may be reckoned as the time when the modern development of landscape art had its origin, and Masaccio here, as in other walks of painting, takes the lead. Throughout the century the landscape background, always in strict subordination to the figure interest, is a common feature of Flemish and Italian pictures, but, in the latter especially, the forms of natural objects are very conventional, and the impression produced on the city-loving Tuscan or Venetian of the time by mountain scenery is shown by the fact that rocks are commonly shown not only as perpendicular but overhanging. Titian is the first painter who, as mountain-bred, depicts the soaring peaks with real knowledge and affection (see the distance in fig. 22, Plate VII.), and the Venetians are the first to paint landscape with some breadth and sense of spaciousness, while, as we have seen, the Flemings, from Hubert van EYCK downwards, distinguish themselves by their minute rendering of details, in which they were followed later on by Dürer, who was fond of landscape, and by Altdorfer. Of Dürer indeed it has been said that some of his landscape sketches in water-colour are the first examples in which a natural scene is painted for its own sake alone. Some of the northern artists of the “Italizing” school of the 16th century, such as Patinir, whom Dürer, about 1520, calls “Joachim the good landscape painter,” Paul Bril later in the century, and Adam Elsheimer, who worked at Rome about 1600, with several of their contemporaries, must not be omitted in any sketch of the history of the art. South of the Alps, the late Italian Salvator Rosa treats the wilder aspects of nature with some imaginative power, and his work, as well as the scenery of his native land, had an influence in the rapid development of landscape art in the 17th century, which was in part worked out in the peninsula. What is known as “classical landscape” was perfected in the 17th century, and its most notable masters were the Lorrain Claude Gheé and the French Poussin and Dughet, while the Italianizing Dutch painters Both and Berchem modify the style in accordance with the greater naturalism of their countrymen.

The landscapes of Claude are characteristic productions of the 17th century because they convey, as their primary impression, the space and atmosphere. The compositions in which a few motifs such as rounded masses of foliage are constantly repeated, are conventional; and there is little effort after naturalism or variety in detail; but the pictures are full of art, and reproduce in telling fashion some of the larger and grander aspects of the material creation. There are generally figures in the foreground, and these are often taken from classical fables or from scripture, but instead of the landscape, as in older Italian art, being a background to the figures, these last come in merely to enliven and give interest to the scenery. The style, in spite of a certain conventionality which offends some modern writers on art, has lived on, and was represented in our own country by Richard Wilson, the contemporary of Reynolds; and in some of his work, notably in the Liber Studiorum, by Turner. Even Corot, though so individual a painter, owes something to the tradition of classical landscape.

The prevailing tendency of modern landscape art, especially in more recent times, has been in the direction of naturalism. Here the masters of the Dutch school have produced the canonical works that exercise a perennial influence, and they were copied by certain northern masters such as Jan van Goyen and Breugel, whose “Autumn” at Vienna has true poetry; Savary, Roghman, and Hercules Seghers. Several of the Dutch masters, even before the time of Rembrandt, excelled in the truthful rendering of the scenes and objects of their own simple but eminently paintable country; but it was Rembrandt, with his pupil de Koningk and his rival in this department Jacob Ruysdael, who were the first to show how a perfectly natural and unconventional rendering of a stretch of country under a broad expanse of sky might be raised by poetry and ideal feeling to the rank of one of the world’s masterpieces of painting. Great as was Rembrandt in what Bode has called “the landscape of feeling,” the “Haarlem from the Dunes” of Ruysdael (fig. 31, Plate IX.) with some others of this artist’s acknowledged successes, surpass even his achievement.

Nearer our own time Constable caught the spirit of the best Dutch landscapists, and in robust naturalism, controlled by art and elevated to the ideal region by greatness of spirit, he became a worthy successor of the masters just named, while in the other hand he furnished inspiration to the French painters of the so-called Barbizon school, and through them to many of the present-day painters in Holland and in Scotland.

To fix the place of J. M. W. Turner in landscape art is not easy, for the range of his powers was so vast that he covered the whole field of nature and united in his own person the classical and naturalistic schools. The special merits of each of these phases of the art are united in this artist’s “Crossing the Brook” in the National Gallery, that is probably the most
perfect landscape in the world (fig. 32, Plate IX.). In a good deal of Turner's later work there was a certain theatrical strain, and at times even a garishness in colour, while his intense idealism led him to strive after effects beyond the reach of human art. We may however put out of view everything in Turner's awareness to which reasonable exception may on these grounds be taken, and there will still remain a body of work which for extent, variety, truth and artistic taste is like the British fleet among the navies of the world.

Among Turner's chief titles to honour is the fact that he portrayed the sea in all its moods with a knowledge and sympathy that give him a place alone among painters of marine. Marine painting began among the Greeks, who were fond of the sea, and the “Odyssey” and other classical landscapes are stronger on this side than the landscapes of the Tuscans or Umbrians, who cared as little for the ocean as for the mountains. The Venetians did less for the sea in their paintings than might have been expected, and in northern art not much was accomplished till the latter part of the 16th century, when the long line of the marine painters of Holland is opened by Hendrick Cornelius Vroom, who found a worthy theme for his art in the defeat of the Spanish Armada. Simon de Vlieger of Rotterdam, who was born about the beginning of the 17th century, was the master of W. Van de Velde the younger (1633-1707), who has never been equalled for his truthful representation of sea-fights. He painted innumerable pictures of the sea-fights of the time between the English and the Dutch, those representing the victories of the Dutch being in Holland, while at Hampton Court the English are triumphant. There are exquisite artistic qualities in the painting of Van de Velde, who is reckoned the canonical master in this branch of art; but the few sea-pieces by Ruysdael, especially the “Dykes” of the Louvre, and the “Stormy Sea” at Berlin, exhibit the element under far more imaginative aspects. Besides Turner there are many British artists of modern days who have won fame in this branch of art that is naturally attractive to islanders.

§ 26. Animal Painting.—In all early schools of representative art from the time of the cave-dwellers downwards, the artist has done better with animals than with the human figure, and there is no epoch of the art at which the portrayal of animals has not flourished. (On Egyptian and Assyrian animals see § 7.) In Greece the representations of animals on coins are so varied and so excellent that we may be sure that the praise given to the pictures of the same creatures by contemporary art of calm seas and shipbuilding. He painted innumerable pictures of the sea-fights of the time between the English and the Dutch, those representing the victories of the Dutch being in Holland, while at Hampton Court the English are triumphant. There are exquisite artistic qualities in the painting of Van de Velde, who is reckoned the canonical master in this branch of art; but the few sea-pieces by Ruysdael, especially the “Dykes” of the Louvre, and the “Stormy Sea” at Berlin, exhibit the element under far more imaginative aspects. Besides Turner there are many British artists of modern days who have won fame in this branch of art that is naturally attractive to islanders.

§ 27. Still-Life Painting.—Like portraiture and landscape, the painting of objects on near planes, or as it is called still-life painting, is gradually differentiated from the figure-piece which was supreme in the early, and has been the staple product in all, the schools. Just as is the case with the other subsidiary branches of painting, it appears, though only as a by-product, in the history of ancient classical painting, passes practically out of existence in medieval times, begins to come to a knowledge of itself in the 16th and 17th centuries, and attains canonicity in the Dutch school of the first half of the 17th century. Still-life may be called the characteristic form of painting of the present day, because the intrinsic worth of the objects represented is a matter of complete indifference when compared with their artistic treatment in tone, colour and texture. By virtue of this treatment it has been noted (§§ 19, 20) that a study of a group of ordinary objects, when seen and depicted by a Rembrandt, may have all the essential qualities of the highest manifestations of the art. There is no finer Rembrandt for pictorial quality than the picture in the Louvre representing the carcass of a flayed ox in a fisher's booth. As illustrating the principle of modern painting this form of the graphic art has a value and importance which in itself it could hardly claim. It is needless to repeat in this connexion what has been said on modern painting in general, and it will suffice here to indicate briefly the history of this particular phase of the art.

The way was prepared for it as has been noticed by the minute and forcible rendering of accessory objects in the figure-pieces and portraits of the early Flemish masters, of Dürer, and above all of Holbein. The painting of flower and fruit pieces without figure interest by Jan Breugel the younger, who was born in 1601, represents a stage onward, and contemporary with him were several other Dutch and Flemish specialists in this department, among whom was Willem van de Heem, born 1603, and the rather older Willem Klaasz Heda may be mentioned. Their subjects sometimes took the form of a lunch-box table with vessels, plate, fruit and other eatables; at other times of groups of costly vessels of gold, silver and glass, or of articles used in art or science, such as musical instruments and the like; and it is especially to be noted that the handling stops always short of any illusive reproduction of the actual textures of the objects, while at the same time the differing surfaces of stuffs and metal and glass, of smooth-rinded apples and gnarled lemons, are all most justly rendered. In some of these pieces we realize the beauty of what Sir Charles Eastlake has called the “combination of solidity of execution with vivacity and grace of handling, the elasticity of surface which depends on the due balance of sharpness and softness, the vigorous touch and the delicate marking—all subservient to the truth of modelling.” In this form of painting the French 18th-century artist Chardin, whose impasto was fuller, whose colouring more juicy than those of the Dutch, has achieved imperishable fame (see fig. 33, Plate X.); and the modern French, who understand better than others the technical business of painting, have carried on the fine tradition which has culminated in the work of Volland. The Germans have also painted still-life to good result, but the comparative weakness in technique of British painters has kept them in this department rather in the background.
PAINTING  

PART II. § 28.—Schools of Painting  

In the following Tables are included the main facts in the history of Painting since about A.D. 1000, with the artists of the first, second and third rank in their schools and periods. The relative importance of the artists is shown by the size of the capitals in which their names are printed. Facts and names of minor importance have in the interest of clearness been excluded. The names are given as commonly used, and where they differ from the headings of these separate biographical articles identification can be made by the index. Words indicating localities are in italics.

II.  
THE PROTO-RENAISSANCE AND THE REVIVAL OF ART IN ITALY.  

CONDITION OF THE ART OF PAINTING IN ITALY BEFORE THE REVIVAL.  

Wall Paintings of poor style, with hard black outlines, devoid of any feeling for beauty or truth to nature. Panel Paintings, chiefly in the form of Enthroned Madonnas of Byzantine type, heavy but dignified; and painted Crucifixes, repulsive in aspect, with exaggeration of physical suffering, black outlines, green shadows, hatched lights.  

[Best Italian Sculpture, e.g. by Antellami at Parma, c. 1200, greatly inferior to contemporary work in France.]

REVIVAL FIRST SEEN IN SCULPTURE.  

Nicola Pisano inspired by the Proto-Renaissance of Southern Italy; his pulpit at Pisa, 1260.  

REVIVAL OF PAINTING UNDER THE INFLUENCE OF THE PROTO-RENAISSANCE.  

At Rome, Pietro Cavallini "Last Judgment" at S. Cecilia, Rome, c. 1293; at Sienna, Duccio di Buoninsegnia, c. 1255-c. 1305, (probably) Luca della Madonna at Florence, and Madonna at Sienna; at Florence, Cimabue, teacher of Giotto.

PART III.—The Technique of Painting

§ 29. The Materials of Painting.—Painting begins, as we have seen, on the one side in outline delineation, on the other in the spreading of a coating of colour on a surface. For both these the material apparatus is ready at hand. Drawing may have begun merely with lines in the air, but lasting designs were soon produced either by indenting or marking any soft substance by a hard point, or by rubbing away a comparatively soft substance, such as a pointed piece of burnt wood, on a rough surface of harder grain. Almost all the materials in use for drawing are of primitive origin. Charcoal, coloured earths and soft stones are natural or easily procured. Our plumago was known to Pliny (xxxiv. 18) and to Cennino (ch. 34), but it was not in common use till modern times. The black-lead pencil is first described as a novelty in 1565 (Quellen schriften edition of Cennino, p. 143). A metal-point, of ordinary lead or tin was used in medieval MSS. for drawing lines on parchment, or on a wooden surface previously whitened with chalk (Theophilus, II. ch. xvii.). Silver-point drawing is only a refinement on this. The metal point is dragged over a surface of wood or parchment that has been ground with finely powdered bone- dust, or, as in modern times, with a wash of Chinese white (Cennino, ch. 6 seq.; Churner, 192d) and through the actual abrasion it leaves a dark line in its track. Pliny knows the technique (xxxii. 68). When a coloured fluid was at hand a pointed stick might be used to draw lines with it, but a primitive pen would soon be made from a split reed or the wing-feather of a bird.

The coating of one substance by another of which the colour is regarded from the aesthetic standpoint is the second source of the art of painting. To manipulate the coating substance so that it will lie evenly; to spread it by suitable mechanical means; and to secure its continued adherence when duly laid, are by no means difficult. Nature provides coloured juices of vegetable or of animal origin, and it has been suggested that the blood of the slain quarry or foeman smeared by the victor over his person was the first pigment. To imitate these by mixing powdered earths or other tinted substances in water is a very simple process. Certain reeds, the fibres of which spread out in water, were used as paint-brushes in ancient Egypt. A natural hare’s-foot is still employed in theatrical circles to lay on a certain kind of pigment, and no great ingenuity would be required on the part of the hunter for the manufacture of a brush from the hair or bristles of the slain beast. In the matter of securing the adhesion of the coating thus spread, nature would again be the guide. Many animals and vegetable products are sticky and ultimately dry hard, while heat or moisture thins them to convenient fluidity. Great heat makes mineral substances liquid that harden when cold. Hence binding materials offer themselves in considerable abundance, and they are of so great importance in the painter’s art that they form the basis of current classifications of the different kinds of painting.

§ 30. The Surfaces covered by the Painter.—Many important questions connected with the technique of painting depend on the nature of surfaces; for the covering coat—though from the present point of view only of interest aesthetically—may, as we have seen, originally serve a utilitarian purpose. The surface in question may be classed as follows: the human body; implements, vessels, weapons, articles of dress; objects of furniture, including books; boats and ships; walls and other parts of buildings; panels and other surfaces prepared especially or entirely to be painted on.

The differences among these from the present point of view are obvious. The body could not suitably be covered with a substance impervious to air and moisture; the coatings of a clay vessel and of a boat should on the other hand make them waterproof. The materials used in building often require protection from the weather. The painting on the prepared panel needs to resist time and any special influence due to location or climate. All such considerations are prior to the questions of colour, design, or aesthetic effect generally, in these coatings; and on them depend the binding materials, or media, with which the colouring substances are applied. The case of one particular surface much employed for pictorial display is exceptional. This is the wall-plaster so abundantly used for clothing an unsightly, rough, or perishable building material, like rubble or crude brick. This function it performs perfectly when left of its natural white or greyish hue, but its plain unbroken surface has seemed to demand some relief through colouring or a pattern, and the recognition of this led to one of the most important branches of the art, mural painting. Now lime-plaster, if painted on while it is still wet, retains upon its surface after it has dried the pigments used, although these have not been mixed with any binding material. On other surfaces the pigments are mixed with some binding material, and on the character of this the kind of painting depends. There is thus a primary distinction between the process just referred to and all others. In the former, pigments, mixed only with water, are laid on while the plaster is wet, and from this “freshness” of the ground the process is called by an Italian term, painting “a fresco” or “on the fresh,” though in ordinary parlance the word “fresco” has come to be used as a noun, as referring to the process of painting “fresco,” though “fresco” is the wall-painter’s process par excellence the word is unfortunately often employed inaccurately for any mural picture, though this may have been executed by quite a different process. In contradistinction to painting “a fresco” all other processes are properly described by the Italian term “a tempera,” meaning “with a mixture.” The word is used as a noun in the sense of a substance mixed with another; it is to be regarded as the imperative of the verb temperare, which both in Latin and Italian means “to divide or proportion duly,” “to qualify by mixing,” and generally “to regulate.” Tempera means strictly “mix,” just as “recipe,” also employed as a substantive, is an imperative meaning “take.” In ordinary parlance, however, the word tempera is confined to a certain class of binding materials to the exclusion of others, so that the more general term “media” is the best to employ in the present connexion. We go on, therefore, to consider these various media in relation to different surfaces and conditions.

§ 31. Binding Materials or Media.—The fundamental distinction among the soluble or non-soluble in water, though, as will be seen presently, some possess both these qualities. The non-soluble media are (1) of mineral, (2) of vegetable origin. (1) Of the former kind are all vitreous pastes or pottery glazes, with which imperishable coloured surfaces or designs are produced on glazed tiles used in the decoration of buildings, on ceramic products, and in all processes of enamelling. Silicate of potash, employed to fix pigments on to mural surfaces of plaster in the so-called “stereochrome” or “water-glass” processes of wall painting (see § 37), is another mineral medium, so too is paraffin wax. In the process called (unscientifically) “fresco secco,” in which the painting is on dry plaster, lime is used as a binding material for the colours. Its action here is a chemical one (see § 36). (2) Non-soluble vegetable media are drying oils, resins, waxes (including paraffin wax, which is really mineral). In ancient times wax, and to some small extent also resins, were used as a protection against moisture, as in shipbuilding and some forms of painting. Resins have always remained, but wax gradually went out of use in the earlier Christian centuries, and was replaced by the new medium, not used in classical times, of drying oil. In northern lands the desire to protect painted surfaces from the moisture of the air led to a more extensive use of oils and resins than in Italy; and it was in the Netherlands that in the 15th century oil media were for the first time adopted in the regular practice of painting, which they have dominated ever since.

The soluble media are of animal and vegetable origin. Egg, yolk or white, or both combined, is the chief of the former. Next in importance are size, gained by boiling down shreds of parchment, and fish glue. Egg is the chief medium in what is specially known as “tempera” painting, while for the painting
TECHNIQUE

PAINTING

483

commonly called distemper or “gouache,” of which scene-painting is typical, size is used. Milk, ox-gall, casein and other substances are also employed. Of soluble vegetable media, the most usual are gums of various kinds. These are common “temperas” or tempera media, and, with gum or honey, form the usual binding material in what is called “watercolour” painting. Wine, vinegar, the milk of fig-shoots, &c., also occur in old recipes.

Attention must be drawn to the fact that substances can be prepared for use in painting that unite soluble and insoluble media, but can be diluted with water. These substances are known as “emulsions.” A wax emulsion, which is also called “saponified wax,” can be made by boiling wax in a solution of potash [in the proportions 100 bleached wax, 10 potash, 250 distilled water (Bergé, Beiträge, 1. 100)] till the wax is melted. When the solution has cooled it can be diluted with cold water. An admixture of oil is also possible. This, according to Bergé, is what Pliny and Vitruvius (vii. 9, 3) call “Punic wax,” a material of importance in ancient painting.

An oil emulsion can be made by mixing drying oil with water through the intermediary of gum or yolk of egg. An intimate mechanical compound, not a chemical one, is thus effected, and it is a very fluid medium. It can certainly be used the result is a “lean” emulsion of a milky-white colour, if yolk of egg a “fat” emulsion of a yellowish tint. When these wax or oil emulsions are dry they have the waterproof character of their non-soluble constituents.

Lastly, it must be noticed that certain substances used in the graphic arts—some of which possess in themselves a certain incunabulousness—can be, as it were, rubbed into a suitably toughened, and at the same time yielding, ground, to which they will adhere, though loosely, without binding material. This is the case with charcoal, chalks and pencil. The same property is imparted by a little gum or starch to soft coloured chalks, with which is executed the kind of work called “pastel.” These are now also made up with an olaeaginous medium and are known as “oil pastels.” Pictures can be carried out in ordinary or in oil pastels, and the work should rank as a kind of painting. The coloured films, rubbed off from the sticks of soft chalk on a suitably rough and sometimes tinted paper, are artistic in their texture and capable of producing very beautiful effects of colour. Professor Church notes also that the colours laid on in this fashion seem peculiarly durable (Chemistry, p. 293).

§ 33. Historical Use of the Various Processes of Painting.—The extent and nature of the employment of these processes at different periods may have here a brief notice.

Tempera painting has had a far longer history and more extended use than any other. The Spaniard Pacheco, the father-in-law and teacher of Velazquez, remarks on the veneration due to tempera because it had its birthday with art itself, and was the process in which the famous ancient artists accomplished such marvels. In the matter of antiquity, painting with vitreous glazes is its only rival: glazed tiles formed, in fact, the chief polychrome decoration for the exteriors of the palaces of Mesopotamia, and were used also in Egypt; but all the wall-paintings in ancient Egypt and Babylonia and Mycenean Greece, all the mummy cases and papyrus rolls in the earliest periods, and in the East, and the same is true of the wall-paintings in Italian tombs. In Greece Proper paintings on terra-cotta fixed by fire were very common in the period before the Persian wars. When monumental wall-painting came to the front just after that event it was almost certainly in tempera rather than in fresco that Polygnotus and his companions executed their masterpieces. It has been doubted whether these artists painted directly on plaster or on wooden panels fixed to the wall, but the discovery in Greece of genuine mural paintings of the Mycenean period has set these doubts at rest. In Italy tomb-paintings actually on plaster exist from the 6th century B.C. The earlier panel painters of the 5th and 4th centuries B.C. also used tempera processes, though their exact media are not recorded. About the time of Alexander there seems to have been felt a demand for a style of painting in which could be obtained greater depth and brilliancy of colouring, with corresponding force in relief, than was possible in the traditional tempera; and this led to painting a wafer-thin film with which abundance of “body” could be secured. There are many puzzling questions connected with this ancient encaustic, but the discovery in recent years of actual specimens of the work, in the form of portraits on the late Egyptian mummy cases of the first centuries A.D. have assisted the study. Meanwhile a new technique to have been in process of evolution for use on walls, for the fresco process, in a complete or modified form, was certainly in use among the Romans.

The history of the fresco process, as will presently be seen, is somewhat puzzling. Vitruvius and Pliny knew it, and it is mentioned in the Mount Athos Handbook, which incorporates the technical traditions of the art of the Eastern Empire; it appears also to have been in use in the Christian catacombs, but was not practised by the wall painters who adorned the early medieval churches south and north of the Alps. The difficulties of the process, and another reason to be noticed directly, may have led to its partial disuse in the West, but we find it again coming into vogue in Italy in the 13th and 14th centuries. In the early Christian centuries its place was taken in the monumental decoration of walls by marble inlays, and especially by glass mosaic, which is in itself an important form of wall-painting and may have put painting on plaster, and with it the fresco process, into the shade; notice will however presently be taken of a theory that seeks to establish a close technical connexion between mosaic work and the fresco painting, which, on the decline in the later medieval period of mosaic, came forward again into prominence.

The tempera processes were accordingly in vogue in early medieval times for wall-paintings (except to some extent in the East), for portable panels, and on parchment for the decoration and illustration of manuscripts. Meanwhile the
use of drying oils as painting media was coming to be known, and both on plaster and on wood these were to some extent employed through the later medieval period, though without seriously challenging the supremacy of tempera. From the beginning of the 15th century, however, oil painting rose rapidly in estimation, and from the end of that century to our own time it has practically dominated the art. Wall-painting in fresco continued to be practised till the last part of the 15th century, and has been revived and supplemented by various other monumental processes in the 19th, but even for mural work the oil medium has proved itself a convenient substitute. Water-colour painting in its present form is essentially an art of the last hundred years. The old tempera processes have been partly revived in our own time for picture-painting, but the chief modern use of tempera is in scene-painting, where it is more commonly called "distemper."

§ 34. Painting with Coloured Vitreous Pastes.—There is no single work that deals with the whole subject of this material and its different uses in transparent or opaque form in the arts, but details will be found in the special articles where these uses are described. (See Ceramics; Mosaic; Enamel; Glass, Stained.) On the subject of the substances and processes employed in the colouring of the various vitreous pastes information is given in H. H. Cunynghame’s Art Enamelling and Vitreous Metals (2nd ed., London, 1906, ch. vi.); but the subject is a large and highly technical one.

Coloured vitreous pastes are among the most valuable materials at the command of the decorative artists, and are employed in numerous techniques, as for example for the glazes of ceramic products including wall or floor tiles; for painted glass windows; for glass mosaic, and for all kinds of work in enamels. The vitreous paste is tinged in the mass with various metallic oxides, one of the finest colours being a ruby red obtained from gold. Silver gives yellow, copper a blue green, cobalt blue, chromium green, nickel brown, manganose violet, and so on. Tin in any form has the curious property of making the vitreous paste opaque. It should be understood that though the vitreous substance and the metallic oxides are essentially the same in all these processes, yet the preparation of the coloured pastes has to be specially conditioned in accordance with the technical nature of the work in view. There are generally various ways of producing reds and blues and greens, &c., from oxides of different metals. The material is generally lead, and it admits of a number of varieties, some of which are highly saturated and beautiful. It is on the lustre and colour of the substance, rather than on the pictorial designs that can be produced by its aid, that its artistic value depends; but though this implies that it comes under the heading “Ornament” rather than “Painting,” yet in certain forms and at particular periods it has been the chief medium for the production of pictorial results, and must accordingly have here a brief notice.

The difference between opaque and transparent coloured glass is the basis of a division among the arts that employ the material. If it be kept transparent the finest possible effect is obtained in the stained-glass window, where the colours are seen by transmitted light. The stained-glass window came into general use in the early Gothic period, and was a substitute for the wall-paintings which had been common in the Romanesque churches of the 11th and 12th centuries. Hence it is a form, and a very sumptuous and beautiful form, of the art of mural painting, representing that art in the later medieval buildings north of the Alps. In Italy, where the practice of wall-painting continued without a break from early medieval to Renaissance times, the stained-glass window was not a national form of art.

The most effective use of opaque coloured vitreous pastes is in ceramics (pottery) and in glass mosaic. The terra-cotta plaque, or tile-painted with designs in glazes of the kind was, as we have seen (§ 7), one of the chief forms of exterior mural decoration in ancient Mesopotamia. The best existing examples were found not long ago on the site of the ancient Susa (“Shushan the palace” of Scripture) and are now in the Louvre. Human figures, animals, and ornaments, are represented not only in lively colours but also in relief; that is to say, each separate glaze brick had its surface, measuring about 12 in. by 9 in., modelled as well as painted for the exact place it had to occupy in the design. On these bricks there are formed small ridges in relief intended to keep the different liquid glazes apart before they were fixed by vitrification in the kiln. Chemical analysis has shown that the yellow colour is an antimoniate of lead, the white is oxide of tin, similar to the well-known opaque white glaze used by the Della Robbia in Italy, the blues and greens are probably oxides of copper, the red a sub-oxide of copper (Semper, Der Stil, i. 332). This same region of the world has remained through all time a great centre for the production of coloured glazed tiles, but the use of “Persian,” “Moresque,” and other decorated plaques has been more ornamental than pictorial.

Glazed pottery only comes occasionally within the survey of the historian of painting. It does so in ancient Greece, because the earlier stages of the development of Greek painting can only be followed in this material; it does so, too, in a sense, in Italian faiance and in some Oriental products, but these hardly fall within our view. The Greek vase was covered with a black glaze of extreme thinness and hardness, the composition of which is not known. Figure designs were painted in this on the surface, and executed in the 5th century (see fig. 3, Plate IV.), or it was used for a background, the design being done on the back of the clay. Other colours, especially a red (oxide of iron) and white, were also employed to diversify the design and emphasize details, and these were also fixed by firing. A special kind of Greek vase was the so-called “polychrome lekuthos,” a small upright vessel, the clay of which was covered with a white “slip” on which figure designs were painted in lively tints. The technique is not quite understood, but the colours were certainly fired. There is an article on “The Technical History of White Lecythi” in the American Journal of Archaeology for 1907; the processes are now, however, analysed.

In glass mosaic thin solid slabs of coloured vitreous pastes are broken up into little cubes of ½ in. to ⅛ in. in size and set in some suitable cement. The artist works from a coloured drawing and selects his cubes accordingly. Any number of shades of all hues can be obtained, and the modern mosaic workers of Italy boast that they dispose of some 25,000 different tints. As it is of the essence of the work to be simple and monumental in effect, a limited palette is all that is needed; and the mosaic processes are executed in the St. Paul’s (see fig. 3, Plate IV.), or it is made in such a way that the colours for a background, the design being done on the back of the clay. Other colours, especially a red (oxide of iron) and white, were also employed to diversify the design and emphasize details, and these were also fixed by firing. A special kind of Greek vase was the so-called “polychrome lekuthos,” a small upright vessel, the clay of which was covered with a white “slip” on which figure designs were painted in lively tints. The technique is not quite understood, but the colours were certainly fired. There is an article on “The Technical History of White Lecythi” in the American Journal of Archaeology for 1907; the processes are now, however, analysed.

The ancients used the art, and the finest existing ancient picture is in a mosaic, not indeed of glass pastes, but of coloured marbles. This is the famous “Battle of Issus” found at Pompeii. Glass mosaic came in the early Roman Empire, but its chief use was in early Christian times, when it was the chief material for mural decoration of a pictorial kind. Ravenna is the place where this form of painting is most instructively represented, and the 5th and 6th centuries A.D. are the times of its greatest glory. At Rome and Constantinople there is fine early work, while at Venice and Palermo is later. In the earliest and best examples the design is very simple, and a few monumental forms of epic dignity, against a flat background (commonly of dark blue, represents the persons and scenes of the sacred narratives. The effect of colour is always sumptuous. Gold, especially for the backgrounds, is in later work freely employed.

The subject of enamel work forms the theme of a separate article. Here it need only be said that pictures can be produced by painting on a ground, generally of metal, with coloured vitreous pastes that are afterwards fired by fusing. Limoges in France has been the great centre of the art, but enamelling loses in artistic value when a too exclusively pictorial result is aimed at.

§ 35. Fresco Painting.—Vitruvius (De Architectura, bk. vii. chs. 2, 3; age of Augustus), Mount Athos Handbook (Hermeneia, chs. 54 seq.; date uncertain but based on early tradition); Cennino

484 PAINTING
Cennini (Trattato della pittura, chs. 67 seq., ed. Milanesi, 1859; Eng. trans. by Christiana J. Herringham, Lond., 1899; Leo Battista Alberti (De re aedificatoria, bk. vi. ch. 38), early and middle 15th century; Vasari (Opere, ed. Milanesi, i. 181; middle of 16th century)—all refer in general terms to the fresco process, as one generally understood in their times. Armenian (Dei veri precetti della pittura; Ravenna, 1587), and Palomino (El Museo pictórico; Madrid, 1715-1724), give more detailed accounts of the actual technical procedure, of which they had preserved the tradition. Much information of the highest value and interest was collected at the time when, in the forties of the 19th century, the project for the decoration in fresco of the new English Houses of Parliament was under discussion. This is contained in various communications by Sir Charles Eastlake, Mr Charles Heath Wilson, and others, printed with the successive Reports of the Commissioners on the Fine Arts from 1842 onwards. The experience obtained in the revived modern work in fresco by Corneille, Hess, and other German artists encouraged by King Ludwig I. of Bavaria, which began at Rome in the second decade of the 19th century, was also drawn upon for the purpose of these Reports. A useful compendium was issued at the time by W. B. Sarsfield Taylor, A Manual of Fresco and Eucastic Painting (Lond., 1843). F. G. Cremer’s Vollständige Anleitung zur Fresco-Malerei (Düsseldorf, 1891), may also be mentioned as a recent manual. The chemistry of the process is well explained by Professor Church in his Chemistry of Paints and Paintings.

The fresco process is generally regarded as a method for the production of a picture. It is better to look upon it in the first place as a colour-finish to plaster-work. What it produces is a coloured surface of a certain quality of texture and a high degree of permanence, and it is a secondary matter that this coloured surface may be so diversified as to result in a pattern or a picture.

We do not know among what people the discovery was first made that a wash of liquid pigment over a freshly laid surface of lime plaster remained permanently incorporated with it when all was dry, and added to it a great beauty of colour and texture. The Egyptians, the Assyrians, the Phoenicians, the Mycenaean and later Greeks, the ancient Italians—all made extensive use of plaster as a coating to brickwork or masonry, but when they coloured it this was done after it was dry and with the use of some binding material or tempers.

The earliest notice of the fresco technique that we have in extant literature is contained in the third chapter of the seventh book of Vitruvius, and it is there treated as a familiar, well-understood procedure, the last stage in the construction and finish of a wall. Pliny also in several passages of his Natural History treats the technique as a matter of common knowledge. In Vitruvius the processes of plastering alba opera are first described (vii. 2, 3), and it is provided that after the rough cast, trullissatio, there are to follow three coats of plaster made of lime and sand, each one laid on when the one below is beginning to dry, and then three of plaster in which the place of the sand is taken by marble. After these are laid the surface plaster, the superfine, and in the supermost coat of all in finest powder. It might now be (1) finished with a plain base, but one brought up to such an exquisite surface that it would shine like a mirror (chs. 3, 9); or (2) with stamped ornaments in relief or figure designs modelled up by hand; or (3) it might be completed with a coat of colour, and this would be applied by the fresco process, for which Pliny uses the formula udo illinere, “to paint upon the wet.” The reason why the pigments mixed with water only, without any gum or binding material, adhere when dry to the plaster is a chemical one. It was first clearly formulated by Otto Donner von Richter in connexion with researches he made on the Pompeian wall-paintings and published in 1868 as an appendix to Helbig’s Campanische Wandgemälde. He demonstrated that when limestone is burnt into lime all the carbonic acid is driven out of it. When this lime is “slaked” by being drenched with water it drinks this in greedily and the resultant paste becomes saturated with an aqueous solution of hydrate of lime. When this paste is mixed with sand or marble dust and laid on to the wall in the form of plaster this hydrate of lime in solution rises to the surface, and when the wet pigment is applied to this the liquid hydrate of lime or lime water, to use Professor Church’s phrasing, “diffuses into the paint, soaks it through and through, and gradually takes up carbonic acid from the air, thus producing carbonate of lime, which acts as the binding material” (Church, p. 278). It is a mistake to speak of the pigment “sinking into the wet plaster.” It remains as a fact upon the surface, but it is fixed there in a sort of crystalline skin of carbonate of lime—the element originally banished when the lime was burned—that has now re-formed on the surface of the plaster. This crystalline skin gives a certain metallic lustre to the surface of a fresco painting, and is sufficient to protect the colours from the action of external moisture, though on the other hand there are many causes chemical and physical that may contribute to their decay. If, however, proper care has been taken throughout, and conditions remain favourable, the fresco painting is quite permanent, and as Vitruvius says (vii. 3, 7), “the colours, when they have been carefully laid upon the wet plaster, do not lose their lustre but remain as they are in perpetuity... so that a plaster surface that has been properly finished does not become rough through time, nor can the colours be rubbed off, that is unless they have been carelessly applied or on a surface that has lost its moisture.”

In the passage from which these words are taken Vitruvius gives useful hints as to the aesthetics of the fresco technique. Italian writers on the subject, such as Vasari, are generally so taken up with the pictorial design represented on the wall that the more essential characteristics of the process in itself are lost sight of. To Vitruvius the work is coloured plaster, not a picture on plaster, and he shows how important it is that the plasterer should be finished with a fine surface of gleaming white so as to light up the transparent film of colour that clothes it. It is the result of such care in classical times that a surface of Pompeian plastering, self-tinted “a fresco,” is beautiful without there being any question of pattern or design.

This beauty and polish of Pompeian, and generally of ancient Roman plaster, has recently been made the ground for calling in question the view accepted for a generation past that it was merely lime plaster painted on “a fresco,” and for substituting a totally different technical hypothesis. The reference is to the treatment of ancient wall-painting generally in the first part of Berger’s Beiträge (2nd ed., 1904, pp. 58 seq.). This writer denies that the well-known classical wall-paintings in question are frescoes, and evolves with great ingenuity a wholly new theory of this branch of ancient technique. It is his view that the plasterer was prepared by a special process in which wax largely figured and which corresponds to, and indeed survives in, the so-called “stucco-lustre” of the modern Italians.

The process in question is described by L. B. Alberti (De re aedificatoria, vi. 9), who says that when the plasterer wall surface has been carefully smoothed it must be adorned with a mixture of wax, resin and oil, which is to be driven in by heat, and then painted over with a fine, thin surface plaster. Alberti’s classical process referred to by Vitruvius under the name “gamosis,” as applied to the nude parts of marble statues, possibly to tone down the cold whiteness of the material. Now Vitruvius, and Pliny, who probably follows him, do as a fact prescribe this same process for use on plaster, but only in the one special case of a wall painted “a fresco” with vermilion, which was not supposed to resist the action of the light unless “locked up,” in this way with a coating of this “Punic” or saponified wax. Neither writer gives any hint that the process was applied to plaster surfaces generally, or that the lustre of these was dependent on a wax polish, and Vitruvius’s description is so clear that it wax had been in use he certainly would have said so.

Vitruvius prescribes so many successive coats of plaster, each one put on before the last was dry, and on the wet uppermost coat the colouring is laid. How can we with any reason substitute for this a method in which the plasterer has to be made quite dry and then treated with quite a different material and
process? Furthermore, Berger holds the astonishing theory that on the self-coloured surfaces of Pompeian and Roman frescoes walls the colour was not applied, as in the fresco process, to the surface of the final coat, but was mixed up with the actual material of the intonaco so that this was a coat of coloured plaster. This is of course a matter susceptible of ocular proof, but the actual fragments of ancient coloured stucco referred to by Berger afford a very slender support to the hypothesis, whereas everyone who, like the present writer, possesses such fragments can satisfy himself that in almost every case the colour coat is confined to the surface. The writer has a fragment of such stucco from Rome, coloured with vermillion, and here there is clear evidence that some substance has soaked into the plaster to the depth of an eighth of an inch, as would be the case if the "gansos" of Vitruvius. The part thus affected is yellowish and harder than the rest of the plaster. A careful chemical analysis, kindly made for the purpose of this article by Principal Laurie of Edinburgh shows that, although the small quantity of the material available makes it impossible to attain certainty, yet the substance may possibly be wax with the slight admixture of some greasy substance. On the other hand all the frescoed stucco fragments, which are not covered with colour, and hence appear as "a fresco." The evidence of the coloured plaster in the house of about the 2nd century B.C. on Delos is wholly against Berger's view.

The writer has many specimens of this, and they are all without exception coloured only on the surface. It is true that there are certain difficulties connected with Pompeian fresco practice, but the description of the process as a wet process in Vitruvius and Pliny is so absolutely unmistakable that Berger's theory must without hesitation be rejected.

The history of the fresco technique remains at the same time obscure. Here again Berger offers an interesting suggestion which cannot be passed over in silence. If the Pompeian technique, as he believes, be a wax process on dry plaster, followed by some form of tempera, how did the fresco technique, which is known both in East and West in the later medieval period, take its rise? The early medieval age was not a time when a difficult and monumental technique of the kind is likely to have been evolved, but Berger most ingeniously connects it with that of mosaic work. In mosaic the wall surface is at first rough plastered and a second and comparatively thin coat of cement is laid over it to receive and retain the cubes of coloured glass, only so much cement being laid each morning as the worker will cover with his tesserae before night. It was the practice sometimes to sketch in water-colours on the freshly laid patch of cement the design which was to be reproduced in mosaic, and Berger points to the incontestable fact if this sketch were allowed to remain without being covered with the cubes it would really be a painting in fresco. This is the way he thinks that the frescoe practice actually began, and the period would be that of the decline of mosaic work in the West as the middle ages advanced.

In spite of the attractiveness of these suggestions, we must reaffirm the view of this article that the testimony of Vitruvius is conclusive for the knowledge by the Romans of the early empire of the fresco technique. Why do we not find evidence of it far earlier cannot be determined, but it is worth noting that the success of the process depends on the plasterer running the moisture for a sufficient time and this it can only do if it be pretty thick. In ancient Egypt and Mesopotamia, for example, the plaster used as painting ground was very thin, and especially in those hot climates would never have lent itself to fresco treatment. On the other side, the decline, and perhaps temporary extinction, of the technique in the early middle ages may be reasonably explained by the general condition of the arts after the break-up of the Roman Empire of the West.

To turn now to the technical questions from which this historical digression took its rise, it will be easily seen that the process of painting in fresco must be a rapid one, for it must be completed before the plaster has had time to dry. Hence only a certain portion of the work in hand is undertaken at a time, and only so much of the final coat of plaster, called by the Italians intonaco, is laid by the plasterer as will correspond to the amount the artist has laid out for himself in the time allowed him by the condition of the plaster. At the end of this time the plaster not painted on is cut away round the outline of the work already finished, and when operations are recommenced a fresh patch is laid on and joined up as neatly as possible to the old. In the making of these joints the ancient plasterer seems to have been more expert than the Italians of the Renaissance, and the seams are often pretty apparent in frescoes of the 15th and 16th centuries, so that they can be discerned in a good photograph. When they can be followed, they furnish information which it is often interesting to possess as to the amount that has been executed in a single day's work. Judging by this test, Mr Heath Wilson, in his Life of Michelangelo, computed that on the vault of the Sistine Michelangelo could paint a nude figure considerably above life size in two working days, the workmanship being perfect in every part. The colossal nude figures of young men on the cornice of the vault at most occupied four days each. The "Adam" (fig 34, Plate X.), was painted in four or perhaps in three. A day was generally occupied by the head of such figures, an about 10 ft. Raphael, or rather his pupils, it is thought, calculated that del Borgo, containing about 350 sq. ft., in about forty days, the group of the young man carrying his father occupying three. The group of the Three Graces in the Villa Farnesina took five days at most. Luini, a most accomplished executant, could paint "more than an entire figure, the size of life, in one day" (Second Report, p. 37). It has been noticed as one of the difficulties about the Pompeian frescoes, that joints hardly occur, or at any rate that larger surfaces of plaster were covered by the painter at a single time than was the case among Renaissance artists, and a conjectural explanation has been offered based on the fact that the ancient plasterer laid, on in many successive coats while in each case the previous one was still humid, was thicker and would hold more moisture than the more modern intonaco, and would accordingly allow the artist longer time in which to carry out his work. Alberti, Armenini, and Palomino only contemplate one or two thin coats over the original rough cast, while Cornelius and his associates, who worked in the frescoes during the 15th century, speak of an intonaco over the rough cast only about a quarter of an inch thick. A piece of plaster ground from Raphael's Loggie in the Vatican was found to be quite thin, and Donner calculated that the ancient grounds were on an average 3 in. thick, the modern only a little over 1 in. On such grounds work had necessarily to be finished within the day, and Cennino expressly says (ch. 67): "Consider how much you can paint in a day; for whatever you cover with plaster you must finish the same day." Hence almost invariably in Italian fresco practice every join means a new day's work. At Pompéi the plaster, it is thought, might have remained damp over night. In the Mount Athos Handbook to was to be mixed with the plaster, undoubtedly to retard its drying.

This necessarily rapid execution gives to well-handled frescoes a simplicity and look of directness in technique that are of the essence of the aesthetic effect of this form of the art. Hence Vasari is right when he extols the process in the words, "of all the various forms in which painters work, wall-painting is the best and most masterly, since it consists in doing upon a single day that which in other methods may be accomplished in several by going over again what has been done.... There are many of our craft who do well enough in other kinds of work, as for example in oil or tempera, but fail in this, for this is in truth the most manly, the safest, and most solid of all ways of painting. Therefore let those who seek to work upon the wall, paint with a manly touch upon the fresh plaster, and avoid returning to it when it is dry." (Opere, ed. Milanesi, i. 181).

The process gives the artist another advantage in that his painting, being executed in the very material of the surface itself, seems essentially a part of the wall. It is lime painting on a lime ground, and fabric and enrichment are one. This
can be noted in the Sala del Consiglio in the Vatican at Rome, one of the stanza or suite of rooms decorated by Raphael and his associates. There are two figures here painted on the walls in oil, and though there is a certain depth and richness of effect secured in this medium, they are too obviously something added as an afterthought, while the figures in fresco seem an integral part of the wall.

Work of this kind, finished in each part at a sitting, is what the Italians call buon fresco or "true fresco," and it has always been, as it was with Vitruvius, the ideal of the art, but at many periods the painters have had to rely largely on retouches and reinforcements after the plaster was dry. Cennino devotes the 67th chapter of his Trattato to a description of the process, and expressly tells us that the method he recommends is the one traditional in the school of Giotto, of which he himself was a direct disciple. He is fully alive to the importance of doing as much as possible while the ground is wet, for "to paint on the fresh—that is, a fixed portion on each day—is the best and most permanent way of laying on the colour, and the pleasantest method of painting," but an ordinary artist of the early part of the 15th century had not sufficient skill to do all that was required at the one moment. Observations made on the works executed by various Italian masters from the 14th to the 16th century show great varieties in this matter of retouching, but the subject need not be dwelt on as it involves no principle. Every painter of worthy ambition, who had entered into the spirit of his craft, would desire to do all he could "on the fresh," and would be satisfied with, and indeed glory in, the conditions and limitations of the noble technique. Masaccio, even at the beginning of the 15th century, is remarkable for the amount of fine pictorial effect he secured without reliance on retouching. It was a second-rate artists, like Pinturicchio, who delighted to furnish up their mural pictures with stucco reliefs and glazing and to add touches of more brilliant pigments than could be used in the wet process. Giotto, Masaccio, Ghirlandajo, Michelangelo, Lusini, are among the frencost proper, who represent the true ideals of the craft.

The following notes upon the methods of the work are derived partly from observation of extant works and partly from the older treatises, but reference has also been made to modern practice in Germany and Italy, as information derived from this last source may be found to vary by those who are disposed to-day to make essays in the process.

To avoid loss of time it is essential that the necessary drawing should all be accomplished beforehand. Pozzo, a painter and writer upon painting, states that he was in the habit of making a draft whenever he began to paint. Before beginning to paint it is necessary to prepare a drawing and well-studied coloured sketch, both of which are to be kept at hand in painting the fresco, so as not to have any other thought than that of the effect to be gained. The method, as we shall see, is, in the first instance, to take advantage of this first impression, and to have the practice of square out the work full size from the sketch on the surface of the rough cast before the intonaco was laid. This at any rate enabled the artist to see how his work as a whole depended on the relation to the space provided for the actual intonaco had to be laid piece by piece over this general sketch and the drawing of each portion repeated on the new surface. In the palmy days of Italian painting, however, as well as in modern times, the manner of working was different. A sketch, which may be this cartoon, or a tracing from it, has been transferred piece by piece to the freshly laid intonaco on which the painting is about to be executed. The drawing may be nailed against the wall, and the cartoons, when they are at all thickly interspersed with other material, that by dint of the paper impressions on the yielded plaster a line sufficient to guide the painter in his work; or the outlines of the cartoon may be pricked and "pounced" with a little bag of red or black powder that will leave a dotted outline on the plaster.

The preparation of the intonaco itself is however a matter for much care. The lime should be prepared from a stone that is as far as possible pure carbonate of lime—the travertine of Tivoli, recommended by Vasari—preferable. If the lime is impure, it is best that the oxide of iron be washed out of it by soaking the air for a considerable time, according to different authorities from eight to twelve months, or even to several years. All experts, from Vitruvius downwards, are agreed on the necessity of this for, but the exact scientific reason therefor do not say. In any case the lime is in a condition at the space provided for of the keeping is that the lime hydrate may take up a certain amount of carbonic acid, though not too much, from the air. Church says that, "not more than one-third or at most two-fifths of the lime should be converted into the carbonate" (p. 19); but Faraday (Fifth Report, p. 25) was of opinion that through lapse of time the lime undergoes a slow reaction which renders it weak and impure. The particles more thoroughly and gave the lime a finer texture so as to mix better with the pigments. At any rate, when Cornelius and his associates started the modern fresco revival at Rome, in 1815, an intonaco was prepared, which had been brought to a proper state of condition. It was noticed that his intention was to keep the ground in a condition that made it possible to mix the pigments without losing the power to prepare them with their old method.

The techniques of the fresco painter is indeed a very restricted one, and this is another reason of the broad range of what can be done. The pigment in the Italian method of painting is an integral part of the painting. The pigment is mixed with a water, such as the ochres raw or burnt, can be used with safety; even the white has to be pure white linen (Italian, Bianco San-Giandomenico), since lead white used in oil painting (Italian, bianca) is too soft for the walls. Vegetable surface is in such a state that it will barely receive the impression of the finger, but not so wet as to be in danger of being stirred up by the brush.

The pigments are richer in little pots, on a tin palette, with a brush round the edge, or on a table, and in old Italian practice each colour was compounded in three shades—dark, middle and light. The water should be boiled or distilled, or should be rainwater; for spring-water often contains carbonate of lime that would be a fit for the pigment to absorb, and give a hazy effect of the earth colours, such as the ochres raw or burnt, can be used with safety; even the white has to be pure white linen (Italian, Bianco San-Giandomenico), since lead white used in oil painting (Italian, bianca) is too soft for the walls. Vegetable surface is in such a state that it will barely receive the impression of the finger, but not so wet as to be in danger of being stirred up by the brush.

Water may be then used in decided touches for the high lights, and the details of the eyes, mouth and other features put in without much searching for the oil of lump or pour. When this is said, it is not meant that the tints first applied sink in and look faint, so that it is necessary sometimes to go over the surface repeatedly with the same colour before the full effect is gained (First Report, p. 24), but it is well to wait a certain time before each step, and even to leave any spot a second time. For the hair the Italians would make three tints, the high lights again following with white. The draperies are broadly treated. After the whole has been laid in, and the surface is dry, the tints may be added one after another, or fused at will, and may be "loaded" in some parts and in others thinly spread, the one essential being that a fresh and crisp effect shall not be lost. The wetness of the ground will always secure a certain softness in all touches even those that give the strong high-lights, and so important is it that the plaster should not begin to dry, that it should be sprinkled if necessary with fresh water. The characteristic softness of the touches laid on "a fresco" is derived not from the manner of working but from the last two strokes of reinforcement which may be put on "a tempera," after which the wall is dry. Armenini says that the shadows may be finished and deepened by hatching, as in a drawing, with black and lake laid on with a dry brush with a medium of gum, size, or white and yolk of egg diluted with vinegar; or the lines may be retouched with a spatula, and thus "wiry," and are as much as possible to be avoided.

As examples of execution in fresco no works are better than those of Luini. He painted rapidly and thinly, securing thereby a transparency of effect that did not however preclude richness. Heath Wilson indeed says of his painting that "it may be
compared to that of Rubens; it is juicy, transparent, and clear; ... his execution is light and graceful." No sounder model could be taken for modern work. The high-water mark of achievement in fresco painting was however reached by a greater than Luini—by Michelangelo in his painting of the Sistine Chapel roof. Considering that since his boyhood he had had no practical experience of the fresco process, and refused the commission as long as he could because he was not a painter but a sculptor, Buonarroti's technical success in the manipulation of the difficult process is still more astounding than the aesthetic result of the work as a creation of imaginative genius. He had to paint for the most part lying on his back in a sort of cradle, and working with his arms above his head, and had no skilled assistants; yet there is no quality in the work that strikes us more than its freshness and air of easy mastery, as if the artist were playing with his task. The fusion of the lights and shadows through the most delicate half-tones is accomplished in that melting fashion for which the Italians used the term studato or "misty," while at the same time the touches are crisp and firm, the accent here and there decided; and the artist's incomparable mastery of form gives a massive solidity to the whole (see fig. 34, Plate X).

In our own times and in English-speaking circles the fresco process has been discredited owing to the comparative failure of the experiments connected with the Houses of Parliament. On the condition of the frescoes there, as well as on that of the pictures in various other media, a series of Memoranda were made by Professor Church, and a select committee of the House of Lords took evidence on the subject as late as December 1906. Most of the frescoes executed in the forties and fifties of the 19th century had got into a deplorable state; but Church's belief was that the main cause of the decay was the sulphurous acid with which, owing to the consumption of coal and gas, the air of London is so highly charged. The action of this acid—a million tons of which are said to be belched out into the London atmosphere in every year—turns the carbonate of lime which forms the surface of the fresco into a sulphate, and it ceases to retain its binding power over the pigments. "The chemical change," he reports, "is accompanied by a mechanical expansion which causes a disruption of the ground and is the main cause of the destruction of the painting." It is a remarkable fact, however, that one of the frescoes in question, Sir John Tenniel's "St Cecilia," completed in 1850, painted very thinly and on a smooth surface, lasted well, and opposed "a considerable measure of successful resistance for nearly half a century on the part of a pure fresco to the hostile influence of the London atmosphere" (Church, Memorandum, iv. 1866).

Abroad, experience was more favourable. The earliest frescoes of the modern revival—those by Cornelius and his associates from the Casa Baraboldy at Rome—are in a fairly good state in the National Gallery at Berlin. Such too is the condition of Cornelius's large fresco in the Ludwigskirche at Munich. The best modern frescoes, from the artistic point of view, in all Europe are those of about 1850 by Alfred Rethel in the town-hall at Aix-la-Chapelle, and they are well preserved. The frescoes executed on the Pickwick Mansion have on the other hand mostly perished; but the climate of that city is severe in winter, and nothing else was really to be expected. We must not expect carbonate of lime to resist atmospheric influences which affect to a greater or less degree all mineral substances.

The process called "fresco-secco" is a method of lime painting on a plaster surface that has been allowed to dry. It is described by Theophrilus in the Schedula of about A.D. 1100; and Mr Charles Heath Wilson in 1843 wrote of it as "extensively used in Italy at present and with great success." It is of course obvious that paintings must often be executed on walls the plastering of which is already dry, and on which the true fresco process is impractical. Some kind of painting in tempera is thus needful, and "fresco-secco" uses for this the lime that is the very constituent of the plaster. This process is too laborious to drench the dry surface of the plaster the night before, with water until a little lime or baryta water has been mixed, and to renew the wetting the next morning. The artist then fixes up his cartoon, pounces the outlines, and sets to work to paint with the same pigments as used in buon fresco mixed with lime or baryta water or with a little slaked lime. If the wall become too dry a syringe is used to wet it. The directions given by Theophrilus (i. 15) correspond with this modern practice. "When figures or representations of other things," he says, "are to be delineated on a dry wall, it must be forthwith moistened with water till it is thoroughly wet. On this wet ground all the colours must be laid that are required, and they must be all mixed with lime, and will dry with the wall so that they adhere to it." Mr C. H. Wilson praises the work for its convenience, economy, and ease of execution, and notes that "for ornament it is a better method than real fresco, as in the latter art it is quite impossible to make the joinings at outlines owing to the complicated forms of ornaments," but says that "it is in every important respect an inferior art to real fresco. Paintings executed by this mode are ever heavy and opaque, whereas fresco is light and transparent." He declares also for its durability, but Professor Church states what seems obvious, that "the fixation of the pigments ... is less complete" than in real fresco though depending on the same chemical conditions (Second Report, 1843, p. 40; Chemistry, p. 270).

Akin to "fresco-secco," in that a mineral agent is used to secure the adhesion of the colouring matter to the plaster, is the process known as stereochromy or water-glass painting. It is a traditional process, but an outcome of comparatively modern chemical research, and is not yet a century old. It is based on the properties of the substance called water-glass, a silicate of potassium or of soda, perfected by the German chemist Von Fuchs about 1825. A process of painting called "stereochromy" was soon after evolved, in which pigments of the same kind as those used in fresco, mixed only with distilled water and laid on a prepared plaster ground, were afterwards fixed and securely locked up by being drenched with this substance, which is equivalent to a soluble glass. Some of the mural paintings in the Houses of Parliament, notably those by Maclise, were executed in this process. Improvements were more recently effected in the process with which the names of Keim and Recknagel of Munich are connected, and in this form it has been used a good deal in Germany in the last quarter of the 19th century both in interiors and in the open air. For example, in 1887 Professor Schraudolph of Munich painted in this process the frescoes of the Hôtel Bellevue in that city. This improved water-glass painting was consecrated as a "painting in a paper bed" before the Society of Arts by the Rev. J. A. Rivington on the 13th of February 1884, and printed in the Journal of the society, No. 1630. A more recent description is contained in F. G. Cremer's Beitragre.

The recipe for the preparation of the actual medium is as follows: 15 parts powdered quartz sand, 10 parts refined potash, 1 part powdered borax, and 1 part powdered ammonium carbonate mixed together and fused in a crucible in a glass furnace. The resultant mass when cold is reduced to powder and boiled for 3 or 4 hours in an iron vessel with distilled water till it dissolves and yields a heavy syrupy liquor of strongly alkaline solution. This can be diluted with water, and in the process is applied hot.

The ground is very carefully prepared, and over a thoroughly sound and dry backing a thin coat of plaster is laid, composed of only 1 part lime to 5 or 8 parts selected sand and pounded marble with a slight admixture of infusorial earth. The object is to obtain a homogeneous porous ground that can be thoroughly permeated with the solution, and to help to secure this the intonaco when dry.
PAINTING

is sprayed with hydroxyl-silicic acid to dissolve away the crystalline skin of carbonate of lime formed on the surface and "open the pores" of the plaster. The surface of the painting ground, which is left with a decided "tooth" upon it, is then well soaked with the solution, and when dry will be found "hard but perfectly absorbent and ready for painting."

The pigments consist in the usual ochres and earths; chrome, reds, greens, and yellows; Naples yellow (antimoniate of lead); cobalt blue and green; and artificial ultramarine; terre verte, &c., with the metals.

It is important however to note, that the pigments (which can be supplied by Messrs Schirmer, late Faulstich, of Munich, and many other firms) are mixed with various substances according to the requirements of the artist, and this is an unusual feature of the invention. The ground solution and neutralize the action of its alkalies. The operations of painting, in which only distilled water is used with the colours, are easy and admit of considerable freedom. Every variety of treatment is possible, and the artist adjusts himself to the "spirit fresco." The work can be left and resumed at will. After the painting is dry there comes the all-important final process of fixing with the water-glass solution. This is sprayed on in a hot state by means of a special apparatus, and the process is repeated till the ground can absorb no more, the idea being that the substance will permeate right through to the wall, and when set will bind pigments, mastic and plastering medium into one firm mass of silica that will not be injured by damp or dry. The last paragraph of the official account of the Keim process issued in 1883 for the guidance of those contemplating mural work runs as follows: "The fixing of the picture is accomplished by means of a hot solution of potash water-glass, which is sprayed on upon them of the fixing solution and neutralize the action of all the materials; thus the moment the painter's brush touches the surface (already softened, if necessary, for the day's work) it unites with the paint, as in the ordinary process, and the evaporations of the spirit oil closes them in, and thus the work is done." The oil of spike lavender, it may be noticed, is an essential oil prepared from Lavandula spica.

§ 39. Oil Processes of Wall Painting. The use of the oil medium for painting on plaster in medieval days opened up a much debated subject on which a word will be said in connexion with oil painting in general. In the later Renaissance period in Italy it came into limited use, and Leonardo essayed it in an imperfect form and with disastrous result in his "Last Supper" at Milan. Other artists, notably Sebastiano del Piombo, were more successful, and Vasari, who experimented in the technique, gives his readers recipes for the preparation of the plaster ground. This with Cennino (ch. 90) had consisted in a coat of size or diluted egg-tempera mixed with milk of fig-shoots, but later on there was substituted for this several coats of hot boiled linseed oil. This was still in common use in the 16th century, but Vasari himself had evolved a better recipe which he gives us in the 8th chapter of his "Introduction to Painting. Over under-coatings of ordinary plaster he lays a stucco composed of equal parts of plaster of Paris, sized with linseed oil and tincture of white of egg and linseed oil. This is then ground with white oil toned down with a mixture of red and yellow easily drying pigments, and on this the painting is executed.

In Edinburgh and other places Mrs Traquair has recently carried out wall paintings on dry plaster with oil colours much thinned with turpentine. The ground is prepared with several coats of white oil paint, and the finished work is finally varnished with the best varnish for carriage.

In most cases oil painting intended for mural decoration has been executed on canvas, to be afterwards attached to the wall. This is the case more especially in France, and also in America at the public libraries and other places. The effort here is to get rid of the shiny effect of oil paintings, and to subject them as far as practicable the oil. As this however serves as the binding material of the pigments the procedure is a risky one. To suppress the oil and to secure a "matt" surface Mr E. A. Abbey employed at Boston and elsewhere, as a medium for painting with ordinary oil colours, wax dissolved in spike oil and turpentine. In France Puvic de Chavannes used some preparation to secure a matt effect in his fine decorative oil painting on canvas.

§ 40. Tempera Painting on Walls.—This is a very ancient and widely diffused technique, but the processes of it do not differ in principle from those of panel painting in the same method. It is accordingly dealt with under tempera painting in general (§ 43).

§ 41. Encaustic Painting on Walls.—(See Schultz-Naumburg, Die Bildkunst der Malerei, p. 122 seq.; Pallott de Montabert, Traité complet de la peinture, vol. 11.)

It has been already mentioned that wax is employed in modern mural painting in order to secure a matt surface. Many pictures have been carried out within the last century on walls in regular wax medium that may or may not represent an ancient process. Hippolyte Flandrin executed his series of mural pictures in St Vincent de Paul and St Germain des Prés in Paris in a process worked out by Pallott de Montabert. Wax dissolved in turpentine or oil of spike is the main constituent of the medium with which the wall is saturated and the colours ground. Heat is used to drive the wax into the plaster.

A German recipe prepared by Andreas Müller in Düsseldorf has been used for mural paintings in the National Gallery, Berlin.
PAINTING

In this one part virgin wax is dissolved in two parts turpentine with a few drops of boiled linseed oil. The pigments are ground in boiled linseed oil with the addition of this medium. The plaster, ground well, dried, is soaked with hot boiled linseed oil diluted with an equal quantity of turpentine. It is then ground with several coats of oil paint for a priming and smoothed with pumice stone. The painting can be executed in a thin water colour technique or with a full body, and dries lighter than when wet and with a dead surface.

Although in modern mural painting wax is employed to secure a matt surface, in ancient times it appears to have been valued rather from the depth and intensity it lent to colours when it was polished. It there represented an attempt to secure the same force and pictorial quality which in modern times are gained by the use of the oil medium. We are told of it by the ancients that it was a slow and troublesome process, and the name of it, meaning "burning in," shows that the inconvenience of a heating apparatus was inseparable from it; yet it seems at the same time to have been a generally accepted technique, and Greek writers from Anacreon to Procopius treat "wax" as the standard material for the painter. Nay more, hardly a day now passes without every one of us bearing testimony in the words he uses to the importance of the technique in antiquity. The Elymologicum majus of the 12th century makes the process stand for painting generally (ἐγκαυστικὸς ὑπογραφήματος), and the name "encaustic" came to be applied not only to painting but also to sumptuous calligraphy. Then it was applied to writing in general, and the name still survives in the Italian inciostro and our own familiar "ink" (Eastlake, Materials, i. 151).

The technique of ancient encaustic has given rise to much discussion which till recently was carried chiefly on a literary basis. Fresh material has been contributed by the discovery, in the eighties of the 19th century, in Egypt of a series of portraits or mummy cases, executed for the most part in a wax process, and dating probably from the first two or three centuries A.D. Previous to this discovery there was little material of a monumental kind, though what appears to be the painting apparatus of a Gallo-Roman artist in encaustic was found in 1847 at St Médard-des-Prés in La Vendée, and has been often figured. It should be stated at the outset that the modern process of dissolving wax in turpentine or an essential oil like oil of spike was not known to the ancients, who however knew how to mix resinous substances with it, as in the case of ship-painting (Pliny xi. 16; Dioscorides i. 98). They also saponified wax by boiling it with potash so as to form what was called "Punic wax" (Pliny xxii. 84 seq.), and this emulsion may be reduced with water, and at the same time combines with oil and with size, gum, egg and other temperas.

Wax, Pliny says, may be coloured and used for painting—ad edendos similitudines (loc. cit.)—but as the name "encaustic" implies, and as we gather from another of Pliny (xxxvii. 35), ceris pingère ac picturam insiiire (xxxv. 122), hence wax was an essential part of the process. Hence the material must have been employed as a rule in a more or less solid form and liquefied each time for use, and not in the form of a diluted solution or emulsion which could be made serviceable cold. It is true that Punic wax mixed with a little oil is prescribed by Vitruvius (vii. 9, 3) as a solution for covering and locking up from the air a coat of the changeable pigment vermilion laid on a wall (see § 35), but the solution is used hot and driven in by application of a heating apparatus.

The accounts of the technique furnished to us by Pliny can be brought into connexion with the actual remains, and Berger and others have succeeded fairly well in imitating these by processes evolved from the ancient notices. It is unfortunate that the most important passage of Pliny (xxxv. 149) appears corrupt. It runs in the received text as follows: "Encausto pingendi duo fuere antiquitatis genera, cera et in ebore cestro, id est periculo, donec classes pingi corpore. Hoc tertium accessit resoluit igni certa penicillo ueluti, quae pictura navilus nec sole nec sole cestre corrupiuit." Here three kinds of encaustic are mentioned; two old and one new (the comparative chronology of the processes need not come into question), and in the two last cases the distinction is that between two instruments of painting, the cestrum and the penicillus or brush. It is natural to suggest that instead of the word cera, which is the material common to all encaustic processes, need not have been introduced and on manuscript authority may be suspected, some word for a third instrument of painting should be restored. Berger, with some philological likelihood, conjectures the word cauterio, which means properly a "branding-iron," but which he believes to be a sort of hollowed spatula or spoon with a large and a small end by which melted waxes of different colours might be taken up, laid on a ground, such as a wooden panel, and manipulated in a soft state as pictorial effect required. Instruments of the kind were found in the Gallo-Roman tomb in La Vendée. The second kind of painting with the cestrum or curriculum was on ivory and must have been on a minute scale. The "cestrum" was certainly a tool of corresponding size, and some have seen in it a sort of point or graver, such as that with which the incised outlines were made on the figured ivory plaques in the Kertch room at St Petersburg (see below); others a small lancet-shaped spatula like the tools that sculptors employ for working on a plaster. The brush, with which melted waxes could be laid on in washes, as was the case on ships, needs no explanation.

An examination of the portraits from the mummy cases (see fig. 35) makes it quite clear that the brush was used with coloured melted waxes to paint in, in sketchy fashion, the draperies and possibly to underpaint the flesh and hair, while the flesh was executed in a more pastos style, with waxes in a soft condition laid on and manipulated with some spatula-like instrument, which we may if we like call "cauterium." The marks of such a tool are on several of the heads unmistakably in evidence, and may be seen in specimens in the London National Gallery. There is a difference of opinion however as to the constitution of the wax. Donner von Richter holds that the wax was "Punic," i.e. a kind of emulsion, and was blended with oil and resinous balsams so as to be transformed into a soft paste which could be manipulated cold with the spatula. Heat for " burning in" (picturam insiire) he thinks was afterwards applied, with the effect of slightly fusing and blending the coloured waxes that had been in this way worked into a picture. Berger, on the other hand, believes that the coloured wax pastes were manipulated hot with the "cauterium," which would be maintained in a heated condition, and that there was no subsequent process of "burning in." Flinders Petrie is of opinion that, even in the
PAINTING

491

The nature of the "cestron" technique on ivory is not known. The only existing artistic designs in ivory are executed by engraved lines, and these are sometimes filled in with coloured pastes. Exquisite work in this style exists in the Hermitage at St Petersburg, and there are examples in other museums, but this can hardly be termed encaustic painting. A better idea of the laboriously executed miniature portraits of which Pliny tells us can be gained from the small medallion portraits modelled in coloured wax that were common at the Renaissance period and are still executed to-day. In these however the smaller details are put in with the brush and pigment.

It is known from the evidence of the Erechtheum inscription that the encaustic process was employed for the painting of ornamental patterns on architectural features of marble buildings, but there is still considerable doubt as to the technique employed in such forms of decorative painting as the colouring of the white plaster that covered the surfaces of stonework on monumental buildings in inferior materials. Polychrome ornament on terracotta for architectural embellishment may have been fixed by the glaze as in ordinary vane painting, but Pliny says that Agrippa *figulimum opus encausto pinxit* in his Thermae (xxxvi. 186). The technique of the polychrome lecithi and of the polychrome terracotta statuary is not certain.

The later history of wax painting after the fall of the Western Empire is of interest in connexion with the evolution of the painter's technique as a whole. Its possible relation to oil painting will be noticed later on. Here it is enough to note that the MS. of the 8th century mentions the mingling of wax with colours, and the Byzantine *Mount Athos Handbook*, recording probably the practice of the 11th century, gives a recipe for an emulsion of partly saponified wax with size as a painting medium. A recipe of the 15th century quoted by Mrs Merrifield from the MSS. of Le Begue gives a similar composition that can be thinned with water and used to temper all sorts of colours.

§ 43. Tempera Painting. [Cennino's *Trattato*, in the English edition with terminal essays by Mrs Herringham (London, 1890), is the best work to consult on the subject. The Society of Painters in Tempera published in 1909 a volume of *Papers* on the subject. F. Lloyd's *Practical Guide to Scene Painting and Painting in Distemper* (London, 1879), is chiefly about the painting of theatrical scenery, and this subject is also dealt with in articles by William Tellin in the *Magazine of Art* (1889), pp. 92, 195.]

This process of tempera painting in the tempera processes may be classified as follows: (1) Size, preferably that made from boiling down cuttings of parchment. Fish-glue, gum, especially gum tragacanth and gum arabic (the Senegal gum of commerce); glycerin, honey, milk, wine, beer, &c. (2) Eggs, in the form of (i) the yolk alone, (ii) the white alone, (iii) the whole contents of the egg beaten up, (iv) the same with the addition of the milk or yolk of young shoots of the fig-tree, (v) the contents of the egg with the addition of about the same quantity of vinegar [(iv) was used in the south, (v) north of the Alps]. (3) Emulsions, in which wax or oil is mingled with substances which bring about the possibility of diluting the mixture with water. Thus oil can be made to unite mechanically (not chemically) with water by the interposition either of gum or of the yolk of egg.

Of these materials it may be noted that a size or gum tempera is always soluble in water, and is moreover always of a rather thin consistency. The latter applies also to white of egg. On the other hand the yolk of an egg makes a medium of greater body, and modern artists, especially in Germany, have painted in it with a full impasto. The yolk of egg or the whole egg slightly beaten up may be used to temper powdered pigments without any dilution by means of water, and the stiffness body can in this way be obtained. The medieval artists seem to have always to have painted with egg thinly, diluting the yolk with about an equal quantity of water. Their panels show this, and we can argue the same from the number of successive coats of paint prescribed by Cennino and other writers. The former (ch. 165) mentions seven or eight or ten coats of colours tempered with yolk alone, that must have been well thinned with water. This point will be returned to later on. The yolk of egg is really itself an emulsion as it contains about 30% of oil or fatty matter, though in its fluid state it combines readily with water. "Egg yolk," writes Professor Church (*Chemistry*, p. 74), "must be regarded as essentially an oil medium. As it dries the oil hardens," and ultimately becomes a substance not unlike leather that is quite impervious to moisture. Hence while size tempera when dry yields to water egg tempera will resist it. Sir William Richmond gave a proof of this in evidence before a committee of the House of Lords in November 1906, describing how he had exposed a piece of plaster painted with yolk of egg medium to all weathers for six months on the roof of a church, and found that at the end perfectly intact. As to the milk of young fig-shoots, it is interesting to know from Principal Laurie (["Pigments and Vehicles of the Old Masters", in *Journal of the Society of Arts*, Jan. 15, 1892, p. 172] that "fig-tree belongs to the same family as the india-rubber tree, and its juice contains caoutchouc." He says, "doubtless the mixture of albumen and caoutchouc would make a very tough and protective medium."

With regard to the historical use of this different media, the medieval Italians used almost exclusively the yolk of egg medium, and this is also the favourite tempera of the moderns. In fact in Italy the word "tempera," as used by Vasari and other writers, generally means the egg medium. On the other hand size or gum was more common north of the Alps. It is in most cases very difficult to decide what temperas were in vogue in different regions and at the various epochs of the art, and the following must not be taken for more than an approximate statement of the facts. As far as it is known, the binding medium in ancient Egypt was for the most part size, while Greek influence from about 600 B.C. onwards may have led to the use of wax emulsion (Punic wax). For paintings on mummy cases, and on papyrus scrolls, the medium may have been size or gum. Professor Flinders Petrie says it was acacia gum. The wall paintings of ancient Mesopotamia as well as those of India and the farther East generally were all in tempera, and it is noteworthy that recipes and technical practices of the East and of the West seem to be curiously alike. The exact media are doubtful. The same doubt exists with regard to the exact processes of wall and panel painting in tempera in ancient Greece and Italy, in the East, in Byzantine times, and in the early middle ages both north and south of the Alps. The materials and processes mentioned by Pliny or in the various technical handbooks are on the whole clearly established, but it is very difficult to say in particular cases what was the final technique employed. Any certainty in this matter must be based on the results not only of superficial examination but of analysis, and the very small quantities of the materials that can be placed at the disposal of the chemist make it often impossible to arrive at a satisfactory diagnosis.

A story in Pliny (xxxv. 102) shows that the Greek panel painters, when not "encaustae," used a water tempera, but whether size or egg was its main constituent we do not know. Apelles is said to have covered his finished panels with a thin coat of what Pliny calls "atra mentum," which may have been a white of egg varnish, for spirit varnishes were not known in antiquity (Berger i. and ii. 183), and the Greeks do not seem to have used drying oils nor varnishes made with these. Byzantine panel painting, according to the *Mount Athos Handbook*, was executed as a rule in an egg tempera (Berger iii. 75), and this technique was followed later on in Italy. For Greek and Etruscan (Italian) wall-paintings of the pagan period; for late Roman wall-paintings north of the Alps, and for Romanesque and Gothic wall-paintings,
we have to choose amongst the theories of size or egg tempera, wax tempera (emulsion), and the lime painting in "fresco secco" described by Theophilus. When we look off to the 14th and 15th century we find that the painters were on a lower ground. For the most part we have the technical directions of Theophilus, for the south those of Cennino. Theophilus (i. c. ch. xxvii.) prescribes a tempera of gum from the cherry tree, and, with some pigments, white of egg. The finished panel was to be covered with an oil varnish (vernition). Cennino prescribes a tempera of the yolk of egg alone, half and half with the pigments, which have been finely ground in water and are very liquid, so that there might be in the ultimate compound about as much water as egg. A tempera of the whole egg with the milk of fig-shoots he recommends, not for panels, but for retouching fresco-work on the wall when it is dry. Tempera panels painted with egg yolk are, like the gum tempera panels of Theophilus, to be varnished with vernice liquida (oil varnish). In these media were executed all the fine tempera panels of the early Italian and early German schools of the 15th century, and these represent a limited, but within its bounds a very perfect and interesting, form of the painter's art.

A word or two may be said here about the various subsidiary processes of tempera painting. With 14th and 15th century tempera painting, which are of great interest as showing the conscientious, and indeed devotional spirit in which the operations were carried out. At the outset of his Trattato Cennino gives a list of the processes the panel painter should observe, which are divided into chapters, each minutely of each of these. The artist must "know how to grind colours, to use glue, to fasten the linen on the panel, to prime with gesso, to scrape and smooth the gesso, to make reliefs in gesso, to put on bole, to grind, to burnish, to scrape, to lay down the various colours, to transfer by pouncing through pricked lines, to sharpen lines with the stylus, to indent with little patterns, to carve, to ornament the panel, and finally to varnish it."

The preliminary operations, before the artist is actually in a position to "be the painter," are prolonged, and it requires with Cennino half a hundred chapters to describe them. The wooden panel is carefully compacted and glazed and is glued on to its face, and over this is laid, in many successive coats, a gesso ground. The tempera and tempera-gesso grounds are prepared by mixing with water gilding with white of egg. The gild is then burnished till it appears almost dark in (the shadow) from its own translucency. The delicate indented patterns which are so charming on the gilded grounds are formed by the pencil and superimposed on the borders of the ground and the body of drapery at Southwold, are stamped with little punches, and Cennino says this is one of the most beautiful parts of the art. In the actual painting, which is on the non-gilded part of the panel, the utmost attention is paid to the harmony of the whole, and a marked aim is the use of a ground containing a monochrome of terra verte and white, and over this in successive coats of great thinness the flesh-tints are spread, every tint being laid in its right position on the face, the darkest flesh-tint being shaded down to the lightest. The walnut gesso, in particular, is a transparent material. Many coats are superimposed, but the green ground is still to remain slightly visible. At the last the lightest flesh-tint is used to obtain the reliefs and the high lights are touched in with white. The outline is shallow and the work is very laborious, but the result is always fine. The varnishing process should be delayed for at least a year, and the varnish, which was evidently thick, is to be spread by the fingers over the painted surfaces, care being taken not to let the varnish go over the gold ground. This should be done if the sun is shining, so that if the varnish be dried it will dry without being placed in the sun.

The process thus described is that which we should call, in the modern sense, painting, for the precision and conventionality of the design and the precautions taken to prevent the painting being subject to the spirit of the art since the 16th century. Nevertheless, the naive simplicity of the design and the exquisite delicacy of the finish have an unfailing charm. We feel, as Cennino says, that this is due to the deliberate and methodical work, and preparation of his patient manipulation as a religious act. A modern artist in tempera specially praises the old work for its "breadth, transparency and purity of colour," qualities owing to the gradual bringing forward of the picture from a simple outline of extreme beauty.

"This outline is never lost; its beautifully opposed and harmonizing lines and masses are retained to the end, even strengthened and accentuated, giving great distinctness at a distance, even when the picture is seen from a considerable distance... The brush marks do not appear as a blurred monochrome of light and shade fills the outline, apparent through the overlaid glory of colour, over which again is thrown a veil of atmosphere, a refugence of light, a suggestion of palpitating space..."

Mrs Herzog in her "Johannes und ein italienisches Malschulwerk" says that the rapid drying of the medium, that prevents the fusing of the colours together in the impasto, which is possible in oil painting. Wasa (History of Painting, Eng. trans. i. 406) thought that in 14th century tempera painting, the artist worked so fast to prevent too rapid drying, and he wrote, "this method rendered possible a liquid and softly gradated handling, and though the Italian variety of tempera allowed greater depth in the shadows, the northern gave the greatest height..." In Italy, owing to the rapid drying of the egg-yolk, modelling was then secured by hatching, which is not so pleasing in its effect as the other method of superimposing thin coats of paint one over the other till the proper effect of shading is secured. One notable quality of tempera is its transparency, which is referred to by Cennino when he says that the original under-painting of terra verte is never to be wholly obliterated.

The well-known group of the "Three Graces," from Botticelli's large panel of the " Allegory of Spring," at Florence, gives the quality of tempera painting very aptly (see fig. 36, Plate X).

There is a Society of Painters in Tempera in London, and some artists are enthusiastic in their admiration of the process for its purer and more certain effects.

Under the heading "tempera" should be noticed another style of painting with a water-medium that is executed as a rule on a large scale and in a comparatively slight fashion. Painting for the purposes of temporary decoration on canvas or wood, or much used for the Italian kind of lasting cartoons. Large cartoons in colour for mural pictures or tapestry, of which Raphael's cartoons are the most famous examples, are other examples; while in modern times the technique is chiefly employed in the decorative scene painting. The pigments are referred to as size or gum, and body is given to them by whitening pipe-clay or similar substance. Work executed in this medium dries much lighter than when it is put on, and to execute it effectively, as in the case of stage scenery, requires much skill and practice. In the study of the art of distemper painting a source of considerable embarrassment to the inexperienced eye is that the colours when wet present such a different appearance to what they do when dry. So writes F. Lloyds, but W. Tolbin, though he recognizes this difficulty, extols the process. "A splendid material distemper! For atmosphere unequaled, and for strength as powerful as oil, in half an hour you can do with it that which in water or oil would take one or two days..." The English word "distemper" and its French equivalent derive from the ancient painting of broad summary painting in body-colour. "Distemper" to English ears suggests house-decoration, "tempera" the work of the artist.

§ 44. Oil Painting.—(See Eastlake, Materials for a History of Oil Painting (London, 1847); Mérimée, De la peinture à l’huile (Paris, 1830); Berger, Beiträge zur Entwickelungs-Geschichte der Maltechnik, esp. lii. 221 sqq., and iv. (Münich, 1897), &c.; Dalbon, Les Origines de la peinture à l’huile (Paris, 1904); Ludwig, Über die Grundsätze der Ölfarbrkultur (Leipzig, 1876); Lessing, Über das Alter der ölmalerei, 1774.)

Oil painting is an art rather of the north than of the south and east, for its development has been furthered by the development of moisture-resisting media in comparatively damp climates, and, moreover, the drying oils on which the technique depends were but sparingly prepared in lands where olive oil, which does not dry, was a staple product.

Certain vegetable oils dry naturally in the air by the process of oxidation, and this drying or hardening is not accompanied by any considerable shrinking, nor by any change of colour; so that oil and substances mixed with it do not alter in volume nor in appearance as a consequence of the drying process. There may be a slow subsequent alteration in the direction of darkening or becoming more yellow; but this is another matter. Among these oils the most important is linseed oil extracted from the seeds of the flax plant, poppy oil from the seeds of the opium poppy, and nut oil from the kernels of the common walnut. With these oils, generally linseed, ordinary tube colours used by painters in oil are prepared, and oil varnishes, also used by artists, are made by dissolving in them certain resins. Their natural drying qualities can be greatly aided by subjecting them to heat, and
also by mingling with them chemical substances known as “dryers,” of which certain salts of lead and zinc are the most familiar. How far back in antiquity such oils and their properties were known is doubtful. Certain varnishes are used in Egypt on mummy cases of the New Empire and on other surfaces, and, though some of these are soluble in water, others resist it, and may be made with drying oils or essential oils, though the art of distilling these last cannot be traced back in Egypt earlier than the Roman imperial period. (See Berthelot, La Chimie au moyen âge, i, 138 (Paris, 1893). When Pliny tells us (xiv, 123) that all resins are soluble in oil, we might think he was contemplating a varnish of the modern kind. Elsewhere, however (xxiv, 34), he prescribes such a solution as a sort of emollient ointment for wounds, so it is clear that the oil he has in view is non-drying olive oil that would not make a varnish. In two passages of his Natural History (xxv. 24-32, xxviii. 79-86) Pliny discusses at length on various oils, but does not refer to their drying properties. There is really no direct evidence of the use among the Greeks and Romans of drying oils and oil varnishes, though a recent writer (Cremer, Unersuchungen über den Beginn der Oedmarei, Düss., 1890) has searched for it with desperate eagerness. The chief purpose of painting for which such materials would have been in demand is the painting of ships, but this we know was carried out in the equally waterproof medium of wax, with which resin or pitch was commingled by heat. The earliest mention of the use of a drying oil in a process connected with painting is in the medical writer Aetius, of the beginning of the 6th century A.D., who says that nut oil dries and forms a protective varnish over gliding or encrusted painting. From this time onwards the use of drying oils and varnishes in painting processes is well established. The Luca MS. of the 8th or 9th century A.D. gives a receipt for a transparent varnish composed of linseed oil and resin. In the Mount Athos Handbook “peserti,” or boiled linseed oil, appears in common use, and with resin is made into a varnish. In the same treatise we also find a clear description of oil painting in the modern sense; but since the dates of the various portions of the Handbook are uncertain, we may refer rather to Theophilus (about A.D. 1100), who indicates the same process with equal clearness. The passages in Theophilus (i. chs. x. and xxvi.-xxviii.) are of the first importance for the history of oil painting. He directs the artist to take the colours he wishes to apply, to grind them carefully without water in oil of linseed prepared as he describes in ch. xx., and to paint thitherwith flesh and drapery, beasts or birds or foliage, just as he pleases. All kinds of pigments can be ground in the oil and used on wooden panels, for the work must be put out in the open air. If anyone now believes that he can so confine himself as to confine this method of painting to moveable works (on panel, in opere ligneo, in his taurium rebus quae sole sicciari possunt) that can be carried out into the sun, but in ch. xxv. of the more or less contemporary third book of Heraclius (Vienna Quellenschriften, No. iv.) oil-paint may be dried either in the sun or by artificial heat. Heraclius, moreover, knows how to mix dryers (oxide of lead) with his oil, a device with which Theophilus is not acquainted. Hence to the latter the defect of the medium was its slow drying, and Theophilus recommends as a quicker process the gum tempera already described. In any case, whether the painting be in oil or tempera, the finished panel must be varnished in the sun with “vernition” (ch. xxii.), a varnish compounded by heat of linseed oil and a gum, which is probably sandlarac resin. The Mount Athos Handbook, § 55, describes practically the same technique, but indicates it as specifically used for flesh, the inference being that the draperies were painted in tempera or with wax. It is worth noting that the well-known “black Madonnas,” common in Italy as well as in the lands of the Greek Church, may be thus explained. They are Byzantine icons in which the flesh has been painted in oil and the draperies in another technique. The oil has darkened with age, while the tempera parts have remained in contrast comparatively fresh. Some of them are probably the earliest oil paintings extant.

Oil painting accordingly, though in an unsatisfactory form, is established at least as early as A.D. 1100. What had been its previous history? Here it is necessary to take note of the interesting suggestion of Berger, that it was gradually evolved in the early Christian centuries from the then declining encaustic technique of classical times. We learn from Dioscorides, who dates rather later than the time of Augustus, that resin was mixed with wax for the painting of ships, and when drying oils came into use they would make with wax and resin a medium requiring less heat to make it fluid than wax alone, and one therefore more convenient for the brush-form of encaustic. Berger suspects the presence of such a medium in some of the mummy-case portraits, and points for confirmation to the chemical analysis of some pigments found in the grave of a painter at Herne St Hubert in Belgium of about the time of Constantine the Great (i. and ii. 230 seq.). One part wax with two to three parts drying (nut) oil he finds by experiment a serviceable medium. Out of this changing wax-technique he thinks there proceeded the use of drying oils and resins as media in independence of wax. If we hesitate in the meantime to regard this as more than a hypothesis, it is yet worthy of attention, for any hypothesis that suggests a plausible connexion between phenomena the origin and relations of which are so obscure deserves a friendly reception.

The Trattato of Cennini Cennini represents two or three centuries of advance on the Schedule of Theophilus, and about contemporary with it is the so-called Strassburg MS., which gives a view of German practice just as the Trattato does of Italian. This MS., attention to which was first called Eastlake (Materials, i. 126 seq.), contains a remarkable recipe for preparing “oil for the colours. Linseed or hempseed or old nut oil is to be boiled with certain dryers, of which white copperas (sulphate of zinc) is one. This, when bleached in the sun, “will acquire a thick consistence, and also become as transparent as a fine crystal. And this oil dries very fast, and makes all colours beautifully clear and glossy besides. All painters are not acquainted with it: from its excellence it is called oleum preciosum, since half an ounce is well worth a shilling, and with this oil all colours are to be ground and tempered,” while as a final process a few drops of varnish are to be added. The MS. probably dates rather before than after 1400.

Cennino’s treatise, written a little later, gives avowedly the recipes and processes traditional in the school of Giotto throughout the 14th century. He begins his account of oil painting with the remark that it was an art much practised by the Germans, thus bearing out what was said at the commencement of this book. He prefers to consider linseed an oil technique for walls and for panels that sounds quite effective and modern. Linseed oil is to be bleached in the sun and mixed with liquid varnish in the proportion of an ounce of varnish to a pound of oil, and in this medium all colours are to be ground. “When you would paint a drapery with the three gradations,” Cennino proceeds, “divide the tints and place them each in its position with your brush of squirrel hair, fusing one colour with another so that the pigments are thickly laid. Then wait certain days, come again and see how the paint covers, and repaint where needful. And in this way paint flesh or anything you please, and likewise mountains, trees and anything else.” In other chapters Cennino recommends certain portions of a painting in tempera to be put in oil, and nowhere does he give a hint that the work in oil gave any trouble through its unwillingness to dry. His medium, however, to have been thick, and perhaps somewhat viscous (ch. 92). This combination of oil paint and tempera on the same piece is a matter, as we shall presently see, of some significance.

In the De re aedificatoria of L. B. Alberti (written about 1450), vi. 9, there is a mention of “a new discovery of laying on colours with oil of linseed so that they resist for ever all injuries from weather and climate,” which may have some reference to so-called “German” practice.

The next Italian writer who says anything to the purpose is
Filarete, who wrote a long treatise on architecture and the arts of design about 1464. It is published in the Vienna Quellen- schriften, neue Folge, No. III. Like Cennino, Filarete (loc. cit. p. 641) speaks of oil painting as specially practised in "Germany," and says it is a fine art when anyone knows how to compass it. The medium is oil of linseed. "But is not this very thick?" he imagines one objecting. "Yes, but there is a way of thinning it; I do not quite know how; but it will be stood out in a vessel and clarified itself. I understand however that there is a quicker way of managing this—but let this pass, and let us go on to the method of painting." Filarete's evident uncertainty about a process, which may be that of the Strassburg MS. for producing oleum preciosum, and his reference to "Germany," inclines us to look elsewhere than to Italy for knowledge about the oil technique. As a fact the evidence of the recipe books is borne out remarkably by that of other records which show that a great deal of oil painting of one kind or another went on in northern lands from the 13th century onwards. These records are partly in the form of accounts, showing large quantities of oil and resins furnished for the use of painters engaged in extensive works of decoration; and partly in the form of contracts concerning the purchase of oil colours. It is true that oil might be merely employed in mordants for gilding or in varnishes, and for oil painting merely in house-decorator fashion over wood, or for colouring statues and reliefs in stone; nevertheless, with a use of proper critical methods, it has been possible for M. Dalbon and others to establish incontestably the employment in artistic wall and panel-painting of drying oils and varnishes before the 15th century, both north and, to a lesser extent, south of the Alps. These passages have been too often quoted to be cited here. (See Eastlake, Materials, p. 46 seq.; Berger, Beiträge ii. 206 seq., &c.) The earliest of the accounts, the English one, is dated 1239: "The king (Henry III.) to his treasurer and chamberlains. Pay from our treasury to Odo the goldsmith and Edward his son one hundred and seventeen shillings and tenpence for oil, sandarac resin, and colours bought, and for pictures executed in the Queen's Chamber at Westminster." Another, about 1275 (temp. Edward I.) runs: "To Robert King, for one carriage of charcoal for oil painting in the King's Chamber, IIII. VIIId." In Flanders in 1407 there is an account (Dalbon, p. 43): "Pour to los d'oil acole pour faire destrempie as couleurs," in 1373-1374 one for "XIIII libras d'oil de linis a faire couleurs" (p. 45). This was for the use of a certain painter Loyes, who executed mural compositions of which some of the subjects are recorded. In the matter of contracts, Dalbon (p. 52) prints one of 1320 prescribing figure and landscape subjects, to be executed "en la meilleur manière que il pourront estre faites en peinture," and concluding, "et seront toutes ces choses faites a huile," and he points convincingly to such wording as a proof that the work here under consideration must be regarded as artistic figure-painting and not mere house decoration. Lastly, just before 1400, the painter Jehan Malouel receives in 1399 oil with colours for "la peinture de plusieurs tables et tableaux d'art," for the Carthusian convent of Champmol near Dijon, which proves the use of oil for panel as well as for mural painting.

The further question about the employment of actual remains of oil painting, mentioned above, noticed is a very difficult one. There seems no reason why all this mural and panel work in oil of the 14th century should have perished, unless the medium was faulty, and, as is natural, many attempts have been made to identify extant examples as representing these early phases of the oil technique. Mural work we need not perhaps expect to find, for we know from the later experience of the Italians of the 16th century that it was difficult even then to find a safe method for oil painting on plaster. With panels preservation would be more likely, and it is always possible that some datable work of the kind may be identified that will carry the monumental history of oil painting back into the 14th century. An exhibition of early English painted panels was held in 1896 in the rooms of the Society of Antiquaries of London, and some good judges believed at the time that certain 14th-century panels from St Michael at Plea, Norwich, were in oil, but this cannot be regarded as established.

If such then be the early history of oil painting, what attitude are we to adopt in face of the famous statement by Vasari that the technique was the invention of the Flemish painter Van Eyck in the year 1410? The statement was first made in the 21st chapter of Vasari's Introduction to his Lives of the Artists (1550), and runs as follows: "Fu una bellissima invenzione, ed un gran' commodità all' arte della pittura, il trovare il colorito a olio. Di che fu primo inventore in Fiandra Giovanni da Brugia (Jan van Eyck). In the life of Antonello da Messina, in the same edition, Vasari dresses up the bare fact he here relates, and gives it the personal anecdotal turn that accords with his literary methods. Here the "invention" follows on the incident of the splitting of a tempera panel varnished in oil, that according to traditional practice Van Eyck had put out in the sun to dry. This artist then turned his attention to devising some means for avoiding such mishances for the future, and, in Vasari's words, "being not less dissatisfied with the varnish than with the process of tempera painting, he began to devise means for procuring a kind of varnish which should dry in the shade, so that to be "o o" and having to place his pictures in the sun. Having made experiments with many things both pure and mixed together, he at last found that linseed and nut oil, among the many which he had tested, were more drying than all the rest. These, therefore, boiled with other mixtures of his, made him the varnish which he had long desired." This varnish Vasari goes on to say he mixed with the colours and found that it "lit up the colours so powerfully that it gave a gloss of itself," without any after-coat of varnish.

Such is the famous passage in Vasari that has probably given rise to more controversy than any similar statement in the literature of the arts. The question is, in what did the "invention" of the Van Eycks, Hubert and Jan his younger brother, consist? and the first answer that would occur to anyone knowing alike the earlier history of the oil medium and Vasari's anecdotal preface is the answer: There was no invention at all.

The drying properties of linseed and nut oil and the way to increase these had long been known, as had also the preparation of sandarac oil-varnish, as well as a colourless (spirit?) varnish of which there is mention in accounts prior to the 15th century (Dalbon, p. 93). The mixing of varnish with oil for a medium was also known, and indeed the oleum preciosum may be the real "invention" of which Alberti and Filarete had only vaguely heard, and of which the Van Eycks later on received the credit. The epitaphs for the tombs of the two Van Eycks make no mention of such a feat as Vasari ascribes to them, and it is quite open to anyone to take up the position that it was no improvement in technique that brought to the Van Eycks their fame in connexion with oil painting, but rather an artistic improvement that consisted in using a traditional process to execute pictures which in design, finish, beauty and glow of colour far surpassed everything previously produced in the northern schools. Pliny writes of the works of a Greek painter of about 400 B.C. that they were the first that had the power to rivet the gaze of the spectator, and in like manner it may be said that the "Adoration of the Lamb" by the Van Eycks, the titular firstfruits of the oil painter's technique, that it impressed the world of its time so mightily through its artistic power and beauty as to elevate to a sort of mystic importance the very method in which the paints were mixed. There is much force in this view, but at the same time it is impossible to deny to the Van Eycks the credit of technical improvements. For one thing, an artist who has an exceptional feeling for colour, texture and delicacy of finish will certainly pay special attention to his technical media; for another, the Van Eycks had a reputation long before Vasari's time for researches into these media. In 1456, fifteen years after the death of the younger brother, Bartolommeo Facio, of Spezia, wrote a tract De viris illustribus in which he speaks of a certain "Joannis Gallicus," who can be identified as Jan van Eyck, as specially "learned in those arts which contributed to the making of a picture, and was on that account credited
with the discovery of many things in the properties of colours, which he had learned from ancient traditions recorded by Pliny and other writers.” Filarete (c.1464) also knew of the repute of Jan van Eyck in connexion with the oil technique. Hence we may credit the Van Eycks with certain technical improvements on traditional practices and preparations in the oil technique, though these can hardly be termed “inventions,” while their artistic achievement was great enough to force into prominence whatever in the technical department they had accomplished.

Another and a more important question remains behind: What was, in fact, the practice in the matter of oil painting in vogue before the Van Eycks, altered or at any rate perfected by them and their successors, and in general use up to the time of Vasari; and how was it related to the older more widely diffused painting “a tempera”? It is indisputable that the oil painting of the Van Eycks and the early Flemish school, together with that of the Florentines and Umbrians, and indeed of all the Italians up to Vasari’s time, save the Venetians, Correggio, and some other north Italians, does not greatly differ in artistic effect, nor, as far as can be judged, in handling, from earlier or contemporary tempers. For example, at Venice in the 15th century, Crevilli paints always in tempera, Cima in oils, but the character of their surface is almost the same, and if anything the tempera is richer in effect than the oil. The contrary is no doubt the case with the tempera “Madonna with the Violet” in the Priest’s Seminary at Cologne when compared with the somewhat later “Dombild,” also by Stephan Lochner, which is believed to be painted in oils, but the two are still in technical character very nearly akin. The fact is that tempera panels were usually coated with an oil varnish, necessarily of a somewhat warm tint, and we could hardly expect to distinguish them from oil pictures painted in or covered by varnish, unless there was a difference in the handling of the pigments. The method of handling appears however to be on the whole the same, and there are many who believe that in all essentials it is the same. Tempera panels, as we have learned from Cennino, were not only varnished but in parts might be repainted in oils (ch. 143), and it is one view of the technique of the early Flemings that it was only an over-painting in oils over a preparation in tempera. Berger is of the opinion that the process was something between the two, that is to say, that it was oil tempera, the medium being an emulsion of oil and water through the intermediary of a gum. Such a medium would, as he points out (Beiträge, iii. 247 seq.), combine the thinness and limpidity in manipulation characteristic of a water tempera with the property of drying hard and impervious to moisture. This is of course only a theory. Of far more weight is the suggestion made by Principal Laurie, of Edinburgh, who has carried on for years a series of careful experiments in the various pigments and media employed in oil painting. As one result of these experiments he has found that the ordinary drying oils and oil varnishes do not, as used to be assumed, “lock up” or completely cover and protect pigments so as to prevent the access of moisture and the gases evolved, but that they are so only superficially, because effectively performed by hard pine-balsams, such as Canada balsam, dissolved in an essential oil and so made into a varnish or painting medium. In pictures by Van Eyck Principal Laurie has detected what he believes to be the use of pigments of a notoriously fugitive character, and he is convinced that the most effective medium for preserving these in the condition in which they have come down to us would be a natural pine-balsam, with probably a small proportion of drying oil; he suggests therefore that the introduction of these ingredients may be the real secret of the Van Eyck technique. There is as yet no proof that the Van Eycks really used such a medium, though it is a preparation possible at their time, and when thinned by a process of emulsification with egg, as Dr Laurie suggests, would be a serviceable one; but they and the other early oil painters certainly used a method, and in all probability, media, that did not differ greatly as regards manipulation from those in vogue in tempera.

From the aesthetic point of view therefore we have to regard early oil painting as only another form of the older tempera, expressing exactly the same artistic ideals and dominated by the same view of the relation of art to nature. To Vasari the artistic advantage of the oil medium was, first, its convenience, and, next, the depth and brilliancy it lent to the colours, which he says it “kindled,” while at the same time it lent itself to a soft fusing of tints in manipulation, so that artists could give to their figures in this technique the greatest charm and beauty combined with a force that made them seem to stand out in relief from the panel. Such a description applies very justly to work like that of the Van Eycks in the “Adoration of the Lamb,” or the later panels of Antonello da Messina, who, according to Vasari’s oft-repeated story, introduced the Flemish system of oil-painting into Venice. The description does not however apply to the freer, more sweeping, more passionate handling of the brush by the greatest of the Venetians such as Titian or Veronese, and still less to the oil painting of 17th-century masters like Rubens or Rembrandt or Velazquez. It is quite clear that whatever improvements in oil technique were due to the early Flemings, oil painting in the modern sense owes still more to the Venetians, who first taught the world the full artistic possibilities of the process. Giovanni Bellini, whose noble altarpiece in S. Pietro at Murano may be called, in a phrase once applied to another of his pictures, “the canon of Venetian art,” is probably entitled to be called the father of modern oil painting. Beginning as a painter in tempera and adopting the new process about 1475, Bellini was able so far to master the new medium that he handed it on with all its possibilities indicated to Giorgione, Palma and Titian. That Venetian oil painting however, with all its brilliancy and freedom, was a child of the older tempera technique is shown by its characteristic method, which consisted in an under-painting in dead colour, over which were superimposed the transparent glazes that secured the characteristic Venetian richness of colouring. Now all the recent writers on the Van Eyck technique agree that, whatever were the exact media employed, the tempera tradition, and perhaps the tempera vehicles, were maintained for the underpainting. In the old tempera-panel technique of Cennino there was a monochrome underpainting in a greenish pigment, over which the flesh tints were spread in thin layers so as never completely to obliterate the ground. Such an underpainting in a few simple colours, black, white and red, was employed by Titian and others of the Venetians, and over it were laid the rich juicy transparent pigments, till “little by little he would have covered with real living flesh these first abstractions of his intention” (Boschi). There is some evidence that in many cases these underpaintings were in tempera, which would have the advantage of drying more quickly than underpaintings in oil, and Boschi (Le Ricche minere della pittura veneziana, 1674) expressly says that the blues in Venetian paintings, e.g. by Veronese, were painted often a guazzo. There was a reason, however, why the Venetians would adopt the traditional practice of the Flemish forerunners. The latter were almost entirely panel painters, while the Venetians used canvas. Now certain media, like the hard pine-balsams which Laurie suggests were the basis of the Van Eyck medium, are not suitable for the immovable surfaces of a well-ground panel, but would be liable to crack on canvas which is more or less yielding. Hence the tougher oil vehicles were in advanced Venetian painting exclusively employed.

This distinction between the thin transparent pigments and those of an opaque body, which is as old as oil painting in any form, becomes in the hands of Bellini and the later Venetians the fundamental principle of the technique. The full advantage of this thinness and transparency is gained by the use of the pigments in question as “glares” over a previously laid solid impasto. This impasto may be modelled up in monochrome or in any desired tints chosen to work in with the colours of the superimposed glazes. Effects of colour of great depth and brilliancy may thus be obtained, and after the glaze has been floated over the surface a touch of the thumb, where the underpainting is loaded and lights are required, will so far thin it as to let the underlying colour show through and blend with the deeper tint of the glaze in the shadows. Thus in the noble Veronese in
the London National Gallery, called the “Consecration of St Nicholas,” the kneeling figure of the saint is tobed in green with sleeves of golden orange. This latter colour is evidently carried through as under painting over the whole draped portions of the figure, the green being then floated over and so manipulated that the golden tint shows through in parts and gives the high lights on the folds.

Again the relation of the two kinds of pigment may be reversed, and the full-bodied ones mixed with white may be struck into a previously laid transparent tint. The practice of painting into a wet glaze or rubbing was especially characteristic of the later Flemings, with Rubens at their head, and this again, though a polar opposite to that of the Venetians, is also derived from the earlier tempera, or modified tempera, techniques. The older tempera panels, when finished, were, as we have seen, covered with a coating of oil varnish generally of a warm golden hue, and in some parts they were, as Cennino tells us, glazed with transparent oil paint. Now Van Mander tells us in the introduction to his Schilderboek of 1604, verse 17, that the older Flemish and German oil painters, Van Eyck, Dürer and others, were accustomed, over a slightly painted monochrome of water-colour in which the drawing was fully laid down, to lay a thin coat of semi-transparent flesh tint in oil, through which the underpainting was still visible, and to use this as the ground for their subsequent operations. In the fully matured practice of Rubens this thin glaze became a complete painting of the shadows in rubbings of deep rich transparent oily pigment, into which the half-tones and the lights were painted while it was still wet. Descamps, in his Vie des peintres flamans (Paris, 1753), describes Rubens’ method of laying in his shadows without any use of white, which he called the poison of this part of the picture, and then painting into them with solid pigment to secure modelling by touches laid boldly side by side, and afterwards tenderly fused by the brush. Over this preparation the artist would return with the few decided strokes which are the distinctive signs-manual of the great master. The characteristic advantages of this method of work are, first, breadth, and second, speed.

The under tint, often of a rich softumber or brown, being spread evenly over the canvas makes its presence felt throughout, although all sorts of colours and textures may be painted into it. Hence the whole preserves a unity of effect that is highly pictorial. Further, as the whole beauty of the work depends on the skill of hand by which the solid pigment is partly sunk into the glaze at the shadow side, while it comes out drier and stronger in the lights, and as this must be done rightly at once or not at all, the process under a hand like that of Rubens is a singularly rapid one. Exquisite are the effects thus gained when under the tint is allowed to seep through here and there, blending with the solid touches to produce the subllest effects of tone and colour.

Of these two distinct and indeed contrasted methods of handling oil pigment, with solid or with transparent under-painting, that of the Flemings has had most effect on later practice. The technique dominated on the whole the French school of the 18th century, and has had a good deal of influence on the painting of Scotland. In general, however, the oil-painting of the 17th and succeeding centuries has not been bound by any distinctive rules and methods. Artists have felt themselves free, perhaps to an undue extent, in their choice of media, and it must be admitted that very good results have been achieved by the use of the simplest vehicles that have been known throughout the whole history of the art. If Rembrandt begins in the Flemish technique, Velazquez uses at first solid under-paintings of a somewhat heavy kind, but when these masters attain to full command of their media they paint apparently without any special system, obtaining the results they desired, now by one process and now again by another, but always working in a free untrammelled spirit, and treating the materials in the spirit of a master rather than of a slave. In modern painting generally we can no longer speak of established processes and methods of work, for every artist claims the right to experiment at his will, and to produce his result in the way that suits his own individuality and the special nature of the task before him.

§ 45. Water-Colour Painting.—(Cosmo Monkhouse, The Earlier English Water-Colour Painters, 2nd ed., London, 1897; Redgrave, A Century of Painters; and Hamerton, The Graphic Arts, contain chapters on this subject.)

Water-colour painting, as has been said, is only a particular form of tempera, in which the pigments are mixed with gum to make them adhere, and often with honey or glycerin to prevent them drying too fast. The surface operated on is for the most part paper, though "miniature" painting is in water-colour on ivory. The technique was in use for the illustrated papyrus rolls in ancient Egypt, and the illuminated MSS. of the medieval period. As a rule the pigments used in the MSS. were mixed with white and were opaque or "body" colours, while water-colour painting in the modern sense is mostly transparent, though the body-colour technique is also employed.

There is no historical connexion between the water-colour painting on the vellum of medieval MSS. and the modern practice. Modern water-colour painting is a development rather from the drawings which the painters from the 15th to the 17th century were constantly executing in the various media.

Among the processes employed was the reinforcement of an outline drawing with the pen by means of a slight wash of the same colour, generally a brown. In these so-called pen-and-wash drawings artists like Rembrandt were fond of recording their impressions of nature, and the water-colour picture was evolved through the gradual development in importance of the wash as distinct from the line, and by the gradual addition to it of colour. It is true that we find some of the old masters occasionally executing fully-tinted water-colour drawings quite in a modern spirit. There are landscape studies in body-colour of this kind by Dürer and by Rubens. These are, however, of the nature of accidents, and the real development of the technique did not begin till the 18th century, when it was worked out, for the most part in England, by artists of whom the most important were Paul Sandby and John Robert Cozens, who flourished during the latter half of the 18th century. First the Wash, which had been originally quite flat, and a mere adjunct to the pen outline, received a certain amount of modelling, and the advance was quickly made to a complete monochrome in which the line outline still played an important part. The element of colour was first introduced in the form of neutral tints, a transparent wash of cool grey being used for the sky and distance, and a comparatively warm tint of brown for the foreground. “The progress of English water-colour,” writes Mr Monkhouse, “was from monochrome through neutral tint to full colour.” Cozens produced some beautiful atmospheric effects with these neutral tints, though the rendering of nature was only conventional, but it was reserved for the second generation of English water-colour artists to develop the full resources of the technique. This generation is represented centrally by Thomas Girtin (1775-1802) and J. M. W. Turner (1775-1851), the latter of whom is by far the greatest representative of the art that has hitherto appeared. To Girtin, who died young—merely a man of 28 when he was drowned during the latter half of the 18th century, the distinction of creating water-colour painting as an art dealing with the tones and colours of nature as they had been dealt with in the older media. W. H. Pyne, a contemporary water-colour artist who also wrote on the art, says of Girtin that he "prepared his drawings on the same principle which had hitherto been confined to painting in oil, namely, laying in the object upon his paper with the local colour, and shading the same with the individual tint of its own shadow. Previous to the practice of Turner and Girtin, drawings were shaded first entirely through, whatever their component parts—houses, cattle, trees, mountains, foregrounds, middle-ground and distances, all with black or grey, and these objects were afterwards stained or tinted, enriched or finished, as is now the custom to colour prints. It was the new practice, introduced by these distinguished artists, that acquired for designs in water-colours upon paper the title of paintings."
Girtin "opened the gates of the art" and Turner entered. If the palette of the former was still restricted, Turner exhausted all the resources of colour in his pursuit of light and air. This art, adding to the traditional transparent washes the effects to be gained from the use of body colour. Body colours, however, were not only laid on by Turner with the solid impasto of the medieval illuminations. He was an adept at dragging thin films of them over a tinted ground so as to secure the subtle colour effects which can also be won in pastel. It would be useless to attempt any account of the technical methods of Turner or of the more modern practitioners in the art, for as in modern oil painting so here, each artist feels at liberty to adopt any media and processes which seem to promise the result he has in view. The varieties of paper used in modern water-colour practice are very numerous, and the idiosyncrasy of each artist expresses itself in the way he will manipulate his ground; superimpose one over the other his transparent washes; load with solid body colour; sponge or scratch the paper, or adopt any of the hundred devices in which modern practice of painting is so rife.

G. B. B.

RECENT SCHOOLS OF PAINTING

British.

At the beginning of the last quarter of the 19th century British art was held to be in a vigorous and authoritative position. During the years immediately preceding it had been developing with regularity and had displayed a vitality which seemed to be full of promise. It was supported by a large array of capable workers; it had gained the widest recognition from the public; and it was curiously free from those internal conflicts which diminish the strength of an appeal for popular appreciation. There were then few sharp divergences or subdivisions of an important kind. The leadership of the Royal Academy was generally conceded, and its relations with the mass of outside artists were little wanting in cordiality. One of the chief reasons for this understanding was that at this time an almost unprecedented approval was enjoyed by nearly all classes of painters. Picture-collecting had become a general fashion, and even the youngest workers received encouragement directly they gave evidence of a reasonable share of capacity. The demand was equal to the supply; and though the number of men who were adopting the artistic profession was rapidly increasing, there seemed little danger of over-production. Pictorial art had established upon all sorts of people a hold too strong, as it seemed, to be affected by change of fashion. All pointed in the direction of a permanent prosperity.

Subsequent events provided a curious commentary on the anticipations which were reasonable enough in 1875. That year has been given to have been the beginning of an era of unprecedented success for British pictorial art, but rather the culminating point of preceding activity. During the period which has succeeded we have witnessed a rapid decline in the popular interest in picture-painting and a marked alteration in the conditions under which artists have had to work. In the place of the former sympathy between the public and art producers, there grew up something which almost approached indifference to their best and sincerest efforts. Simultaneously there developed a great amount of internal dissension and of antagonism between different sections of the art community. As an effect of these two causes, a new set of circumstances came into existence, and the aspect of the British school underwent a radical change. Many art workers found other ways of using their energies. The slackening of the popular demand inclined them to experiment, and to test forms of practice which formerly were not accorded serious attention, and it led to the formation of detached hostile groups of artists always ready to contend over details of technical procedure. Restlessness became the dominant characteristic of the British school, along with some intolerance of the popular lack of sympathy.

The first sign of the coming change appeared very soon after 1875. The right of the Royal Academy to define and direct the policy of the British school was disputed in 1877, when the Grosvenor Gallery was started "with the intention of giving special advantages of exhibition to artists of established reputation, some of whom have previously been imperfectly known to the public." This exhibition gallery was designed not so much as a rival to the Academy, as to provide a place where could be collected the works of those men who did not care to make their appeal to the public through the medium of a large and heterogeneous exhibition. As a rallying place for the few unusual painters, standing apart from their fellows in conviction and method, it had good reason for existence; and that it was not regarded at Burlington House as a rival was proved by the fact that among the contributors to the first exhibition were Sir Francis Grant, the President of the Royal Academy, and such artists as Leighton, Millais, G. F. Watts, Alma-Tadema, G. D. Leslie and E. J. Poynter, who were at the time Academicians or about to become so.

The Grosvenor Gallery and the Academy.

The Grosvenor Gallery was opened in 1877 with the idea that it was to be a rival to the Royal Academy. It was started "with the intention of giving special advantages of exhibition to artists of established reputation, some of whom have previously been imperfectly known to the public." This exhibition gallery was designed not so much as a rival to the Academy, as to provide a place where could be collected the works of those men who did not care to make their appeal to the public through the medium of a large and heterogeneous exhibition. As a rallying place for the few unusual painters, standing apart from their fellows in conviction and method, it had good reason for existence; and that it was not regarded at Burlington House as a rival was proved by the fact that among the contributors to the first exhibition were Sir Francis Grant, the President of the Royal Academy, and such artists as Leighton, Millais, G. F. Watts, Alma-Tadema, G. D. Leslie and E. J. Poynter, who were at the time Academicians or about to become so.

The various protesting art association continues to work in most matters independently of one another, with the common belief that the dominant influence of Burlington House is not exercised entirely as it should be for the promotion of the best interests of British art, and that it maintains tradition as against the development of individualism and a "new style."
PAINTING

original regard for nature, or of some unusual conviction as to technical details, have found comparatively few admirers. The designers, however, and the workers in the decorative arts have found opportunities which formerly were denied to them. They have had more scope for the display of their ingenuity and more inducement to exercise their powers of invention. A vigorous and influential school of design developed which promised to evolve work of originality and excellence. British designers gained a hearing abroad, and earned emphatic approval in countries where a sound decorative tradition had been maintained for centuries.

The one dominant influence, that of the Pre-Raphaelite Brotherhood, which in the 'fifties was altering the whole complex of British art, had begun to wane early in the 'seventies, and it was rapidly being replaced by another scarcely less distinctive. The younger generation of artists had weaned, even before 1875, of the pre-Raphaelite precision, and were impatient of the restrictions imposed upon their freedom of technical expression by a method of practice which required laborious application and unquestioning obedience to a rather formal code of regulations. They yearned for greater freedom and boldness, and for a better chance of asserting their individual capacities. When they gave way to a strong reaction against the over-refined and their immediate predecessors, and cut themselves deliberately adrift.

With the craving of young artists for new forms of technique came also the idea that the "old-master traditions" were opposed to the exact interpretation of nature, and were based too much upon convention to be adapted for the needs of men who believed that absolute realism was the one thing worth aiming at in picture-production. So Paris instead of Rome became the educational centre. There was to British students, dissatisfied with the half-hearted and imperfect systems of teaching with which they were tampered at home, a peculiarly exhilarating atmosphere in the French studios—an amount of enthusiasm and a love of art for its own sake without parallel elsewhere. They saw in operation principles which led by the right sequence of stages to sure and certain results. In these circumstances they allowed their sympathies with French methods to become rather exaggerated, and were somewhat reckless in their adoption of both the good and bad qualities of so attractive a school.

At first the results of this breaking away from all the older ornamental customs were not wholly satisfactory. British students came back from France better artists; stronger and sounder draughtsmen, more skilful manipulators, and with an infinitely more correct appreciation of refinements of tone-management than they had ever possessed before; but they brought back also a disproportionate amount of French mannerism and a number of affections which sat awkwardly upon them. In the first flush of their conversion they went further than was wise or necessary, for they changed their motives as well as their methods. The quietness of subject and reserve of manner which had been hitherto eminently characteristic of the British school were abandoned for foreign sensationalism and exaggeration of effect. An affection of extreme vivacity, a liking for theatrical suggestion, even an inclination towards coarse presentation of unpleasant incidents from modern life—all of which could be found in the paintings of the French artists who were then recognized as leaders—must be noted as importations from the Paris studios. They were the source of a distinct degeneration in the artistic taste, and they introduced into British pictorial practice certain unnatural tendencies. Scarcely less evident was the depreciation in the instinctive colour-sense of British painters, which was brought about by the adoption of the French habit of regarding some accuracy of tone-relation as the one important thing to aim at. Before this there had been a preference for rich and sumptuous harmonies and for chromatic effects which were rather compromises with, than exact renderings of, nature; but as the foreign influence grew more active, these pleasant adaptations, inspired
by a sensitive love of colour for its own sake, were abandoned for more scientific statements. The colder and cruder tone-

studies of the modern Frenchman became the models upon which the younger artists based themselves, and the standards against which they measured their own success. "Actuality" was gained, but much of the poetry, the delicacy, and the subtle charm which had distinguished British colourists were lost.

For some while there was a danger that the art of Great Britain might become hybrid, with the French strain predominating. 

**Danger of the French Influence.** So many students had succumbed to the fascination of a system of training which seemed to supply them with a perfect equipment on all points that they were inclined to despise not only the educational methods of their own country, but also the inherent characteristics of British taste. The result was that the exhibitions were full of pictures which presented English people and English landscape in a purely arbitrary and artificial manner, strictly in accordance with a French convention which was out of sympathy with British instincts, and indeed, with British facts. Unfortunately a recessive middle course was observed in the extreme application of the science of the French art schools and the comparative irresponsibility in technical matters which had so long existed in the British Isles. In the career of men like Stanhope Forbes, H. S. Tuke, Frank Bramley, and other prominent members of the school, many illustrations are provided of the way in which this readjustment has been effected. Their pictures, if taken in a sufficiently long sequence, summarize instructively the course of the movement which became active about 1875. They prove how valuable the interposition of France has been in the matter of artistic education, and how much Englishmen have improved in their understanding of the technique of painting.

One noteworthy outcome of the triumph of common sense over fanaticism must be mentioned. Now that the exact relation which French teaching should bear to British thought has been adjusted, an inclination to revive the more typical of the forms of pictorial expression which had given their vogue in the past is becoming increasingly evident. Picturesque domesticity is taking the place of theatrical sensation, the desire to select and represent what is more than ordinarily beautiful is ousting the former preference for what was brutal and ugly, the effort to please is once again stronger than the intention to surprise or shock the art lover. Even the Pre-Raphaelite theories and practices are being reconstructed, and quite a considerable group of young artists has sprung up who are avowed believers in the principles which were advocated so strenuously in 1850.

To French intervention can be ascribed the rise and progress of several movements which have had results of more than ordinary moment. There was a few years ago much banding together of men who believed strongly in the importance of asserting plainly their belief in the doctrines to which they had been converted abroad; and as a consequence of this desire for an offensive and defensive assertion, many detached groups were formed within the boundaries of the British school. Each of these groups had some peculiar tenet, and each one had a small orbit of its own in which it revolved, without concerning itself overmuch about what might be going on outside. Roughly, there were three classes into which the more thoughtful British artists could thus be divided. One included those men who were in the main French in sympathy and manner; another consisted of those who were not insensible to the value of the foreign training, but yet did not wish to surrender entirely their faith in the British tradition; and the third, and smallest, was made up of a few individuals who were independent of all assistance from without, and had sufficient force of character to ignore what was going on in the art world. In this third class there was practically no common point of view: each man chose his own direction and followed it as he thought best, and each one was prepared to stand or fall by the opinion which he had formed as to the true function of the painter. Necessarily, in such a gathering there were several notable personalities who may fairly be reckoned among the best of English modern masters.

Paradoxically the most influential group of all was the gathering of painters who established themselves in the Cornish village of Newlyn (q.v.). This group—the Newlyn School, as it was called—was afterwards much modified, and many of its most cherished beliefs were considerably altered. In its beginning it was essentially French in atmosphere, and advocated not only strict adherence to realism in choice and treatment of subjects, but also the subordination of any attempt at decorative effect to the requirements of the realistic details, such as the exclusive use of flat brushes and the laying on of pigments in square touches. The colony was formed, as it were, in stages; and as the school is to be reckoned in the future history of modern art, it is essential that the who and what of it may here be set on record. Edwin Harris came first, and was joined by Walter Langley. Then, in the following order, came Ralph Todd, L. Suthers, Fred Hall, Frank Bramley and T. C. Gotch, and finally, in 1884, Walter Stott, and Desmond and Chevalier Tayler next arrived; then Miss Elizabeth (Mrs Stanhope Forbes), B. Bourdillon, W. Fortescue and Norman Garstin. Ayerst Ingram, H. S. Tuke, H. Martin and F. Millard ultimately a retreat middle course was observed in the extreme application of the science of the French art schools and the comparative irresponsibility in technical matters which had so long existed in the British Isles. In the career of men like Stanhope Forbes, H. S. Tuke, Frank Bramley, and other prominent members of the school, many illustrations are provided of the way in which this readjustment has been effected. S. Tuke, H. Martin and F. Millard
done much to prove the extent of the foreign influence upon the British school.

In its wider sense the Impressionist school may be said to include now all those students of nature who strive for the representation of the effects of light and colour without minute details, who look at the landscape before them largely and comprehensively, and ignore all minor matters which would be likely to interfere with the simplicity of the pictorial rendering. To it can be assigned a number of artists who adopt a similar method in the decorative analysis of colour advocated by the French Impressionists. These men were headed by J. A. M’N. Whistler (g.v.), born in America in 1834, and trained in Paris under Gleyre. His pictures have always been remarkable for their beauty of colour combination, and the decorative manner in which the subject is simplified. They gained for the artist a place among the chief modern executants, and have attracted to him a host of followers. Other notable painters who have places in the school are Mark Fisher, an American, who has been a pupil of the Ecole des Beaux Arts, for which he won the Graviers, one of the oldest American institutions; and P. Wilson Steer, an artist who began his career with the profession of a painter, and, based upon his training in the École des Beaux Arts, a style of his own, which he displays effectively in both landscapes and portraits.

The International Society of Sculptors, Painters, and Gravers, inaugurated in 1898, although not by its nature confined to British art and artists, who compose little more than half of its members, has its headquarters in London. Its object of setting before the British public the most modern and eccentric expressions of the art of the chief European countries. Its exhibitions are striking and the contributions for the most part serious and interesting; but while the freedom of treatment is much admired, one is left with the impression that many pictures are not altogether successful. The impetuous displays by rebellious painters and sculptors and artists have had much influence on the native school. The presidents have been J. A. M’N. Whistler and Auguste Rodin, and the vice-presidents include among others a outstanding master of the landscape style, with their views and their vigour, sufficiently indicate the spirit and the politics of the society.

Generally speaking, the very large class of artists who fell only to a limited group, and the Fauves, the group of French painters, with their distinguishing peculiarities of manner, and have by year assimilated themselves more closely to their less advanced brethren. The section in which their energetic propagandism has been most notable is that assigned to the "French School." A definite mark has been made there by men like S. J. Solomon (b. 1860; A.R.A. 1896; R.A. 1906), trained at the Royal Academy, the Munich Academy and the École des Beaux Arts in Paris, and widely known by such pictures as "G. F. Moore and his Circle" (1890), "The Birth of Love" (1893); and Arthur Hacker (b. 1858; A.R.A. 1894; R.A. 1910), educated at the Academy and in Bonnat’s studio, and the painter of a considerable series of semi-historical and symbolical canvases. They exerted a notable influence, that the Fauves have been essentially a group of painters who have introduced some new elements into the later practice of the school. At the same time admirably effective work has been done in this section and others by many painters who have kept much more closely in touch with the older type of aesthetic deliberation, who have not associated themselves openly with any of the newer movements. Among the more prominent of these French painters there are, or have been, some excellent craftsmen, whose contributions to the classic tradition of nature and to the tradition of the nude have been full of permanent interest. In the school of historical incident good work was done by Sir John Gilbert (1817-1897; R.A. 1876), a robust and ingenious illustrator of romantic motives, with a never-failing power of invention and of original composition. His "Death of the Owl" (1839-1893; R.A. 1877), a fine colourist and a clever manipulator, whose scenes from the life of past centuries were full of rare vitality; P. H. Calderon (1833-1898; R.A. 1867), a graceful and significant delineation of the human figure in various attitudes; and Stacy Marks (1829-1898; R.A. 1879), a painter of many subjects of mature work, with touch of real humour. Besides these, there are Sir J. D. Linton (b. 1840), who has produced noteworthy compositions in oil and water colours; Frank Dicksee (b. 1853; A.R.A. 1881; R.A. 1891), who has given new vitality to the treatment of the nude; and sentiment and composition are in equal proportions; A. C. Gow (b. 1848; R.A. 1881), whose "Cromwell at Dunbar" (1886), "Flight of James II. after the Battle of the Boyne" (1888), and "Death of General Wolfe" (1896) are among his best-known works. The list of British painters who have made reputations by the cultivation of artistic portraiture is one of the most important in the history of the school, and it is natural to find among the most prominent of these names those of the most brilliant painters of the day. J. J. Banister, an American (b. 1844; R.A. 1894), an American citizen (b. 1856), a pupil of Corot Duran, who after 1885 was recognized as one of the most brilliant painters of the day; J. J. Banister, an American (b. 1844; R.A. 1894), A.C. Gow (b. 1848; R.A. 1881), an Associate in 1897, a graceful and accomplished artist, with a sound technical method and a delightful sense of style; A. C. S. Cope (b. 1857), trained in Paris, and elected an Associate in 1899, who can portray the character of an individual with heaviest brush and with sure hand; James Sant (b. 1820), elected an Academician in 1870, a strong favourite of the public throughout a long career; W. W. Obea (b. 1848; A.R.A. 1877; R.A. 1881), trained in the Royal Academy Schools, an industrious and prolific worker; H. B. Walker (b. 1828; A.R.A. 1866; R.A. 1870), trained in London and Paris, who produced a long series of portraits and portrait groups, and many miniatures; W. L. Llewellyn (b. 1860), educated at the South Kensington Schools and in Corvon’s studio in Paris, an able draughtsman and a thorough executant; C. W. Furse (g.v.), trained...
first in the Slade School under Professor Legros and afterwards in Paris, whose early death removed a master of his art; and others like Walter Osborne, Richard Jack, Glyndwr Philip and Gerald Kelly.

In the class of figure painters, who are individual in their work, and owe little or nothing to the suggestions of foreign teachers, the number of artists can be enumerated who have in common little besides a sincere desire to express their personal conviction in their own way. Among them are some of the most distinguished, as for example the unproclaimed chefs of the school. Sir John Millais occupies a place in this group by virtue of his admirable pictorial work, and with him are Holman Hunt, Dante Gabriel Rossetti, G. F. Watts, Sir Edward Burne-Jones, Albert Moore and Frank Brangwyn. There are also J. M. Strudwick (b. 1849), R. Spencer Stanhope (d. 1908) and Evelyn de Morgan, followers of Burne-Jones, and J. W. Waterhouse (A.R.A. 1889; R.A. 1892), in many ways the most remarkable of the group. The latter's work is essentially decorative, and an advocate of the Pre-Raphaelites, Frank Brangwyn, whose pictures and designs are marked by fine qualities of execution and by much sumptuousness of colour; and several others, like H. C. Draper, John Linnell, Birket Foster, and E. A. Abbey, again, M. Greiffenhagen, F. Cayley Robinson and Mrs Swithinwyne.

Into this class come also the decorative painters, Walter Crane (b. 1845), a prolific illustrator and picture-painter, and Evelyn de Morgan, whose work, in all branches of decoration; Frank Brangwyn, whose pictures and designs are marked by fine qualities of execution and by much sumptuousness of colour; and several others, like H. C. Draper, John Linnell, Birket Foster; and E. A. Abbey, again, M. Greiffenhagen, F. Cayley Robinson and Mrs Swithinwyne.

As a branch of the decorative school, a small group of artists who have revived the practice of tempera-painting must also be noted. It includes Mrs Adrian Stokes, J. D. Batten, J. H. Frame, Herbert Gaskin, and a few others with well-marked decorative tendencies.

During recent years a movement has begun which apparently aims at the revival of Pre-Raphaelitism. It is headed by a few young painters, whose work is concerned with the precision of the 19th-century Pre-Raphaelites and a kind of decorative formality. The most influential of the artists concerned in the formation of this school (b. 1889) of originality and quaintness of fancy give to his pictures a more than ordinary degree of persuasiveness. A strong colourist and an able draughtsman, he possesses in a high degree the faculty of imaginative expression, allied with humour that never degenerates into farce. His themes are drawn from the finest literature for stories that are sometimes moral: Some of his most celebrated works, such as The Little Devil, are moral. Other prominent members of the group are F. Cadogan Cowper (A.R.A. 1907) and Miss Eleanor Fortescue-Brickdale, who is in a manner like Byam Shaw, but yet does not quite match him. The painters of landscapes and sea-pieces have for the most part been little affected by the unrest which has caused so many new departures in figure-work. A love of nature has always been inherited by Englishmen, and it has proved itself to be strong enough to keep those artists who seek their inspiration out of doors from falling to any great extent under the control of particular technical factors. Arthur Heygate Mackmurdo is in the position of having little evidence of any change in point of view, or of the growth of any modern feeling at variance with that by which masters of landscapes were swayed a century or more ago. Impressionism has gained a few adherents of late years, and though the work of some of these in response to a suggestion from England—has reacted upon a section of the newer artists. But, on the whole, in this branch of art the British school has gained in power and confidence, without surrendering that study of detail which is a characteristic of English draughtsmanship. The absence of any common convention, or of any set pattern of landscape which would lead to uniformity of effort, has left the students of nature free to express themselves in a personal way. The most devout believers in the value of French training, who have worked over much time from the Paris studios, have, not except in rare instances, demanded any radical remodelling of the British landscape school on French lines, as local conditions affecting the practice of this branch of art make impossible any general solutions of its problems. In this field can claim to be judged on individual merits, and not as members of a particular coterie. Still, it is convenient to divide the members of the landscape school into such classes as realists, romanticists and subjectivists.

Among the most notable of the first class are H. W. B. Davis (b. 1883; A.R.A. 1873; R.A. 1877), the painter of a long series of dainty scenes which suggest happily the charm of French landscape; and Sir Hubert von Herkomer (b. 1846; R.A. 1881; A.R.A. 1887), an artist whose career has been marked by consistent effort to interpret nature's suggestions with dignity and intelligence; Sir Ernest A. Waterlow (b. 1850; A.R.A. 1890; R.A. 1903), trained in the Royal Academy and afterwards in the United States; Sir Richard Redgrave, in Water-Colours, a graceful painter, with a tender colour feeling and an excellent technical style; Yeend King (b. 1855), trained partly in England, and partly in Paris under Bonnat and Corot, a sound craftsman who made a reputation by landscapes in which are introduced groups of figures on a fairly important scale; Alfred Parsons (b. 1847), elected an Associate in 1880, and a member of the Royal Academy in 1886, whose rich river scenery has been much admired, and with much minuteness and exquisiteness of detail, especially in the rendering of flowers; and Frank Walton (b. 1840), who, chooses, as a rule, landscape motives which enable him to display unusual qualities of draughtsmanship, with the aid of the most delicate strokes, belonged Vicat Cole, R.A.; Birket Foster, J. W. Oske, R.A.; Keesee Halswelle, and perhaps Alfred W. Hunt, though in his case realism was tempered by a delicate poetic imagination.

The romanticists and pastoral painters have in many cases been personal friends in the example of form is being shadowed by some few to such famous Englishmen as W. L. Wylie (b. 1851; A.R.A. 1889; R.A. 1894), whose work is well known; the uncompromising interpreter of romantic subjects; Edward Stott (A.R.A. 1906), trained in Paris under Carolus Duran, whose best works were done in the provinces; an impressionist; T. J. Drinkwater (b. 1881; R.A. 1905), a master of the landscape of the South of France; and the Academy in Paris, and elected an Academy in 1898. He became a strong favourite of this group, and the public and academic and precise technical methods were widely admired by the many people who are not satisfied with altered transcriptions of natural scenes and of the passion of nature.

In marine painting no one has appeared to rival Henry Moore, perhaps the greatest student of wave-forms the world has seen; the work of Richard Redgrave, an Irish painter, whose powers showed no signs of failure up to his death in 1904, after some half-century of continuous labour; W. L. Wylie (b. 1851; A.R.A. 1889; R.A. 1894), whose work is well known; drinkwater (b. 1881; R.A. 1905), a master of the landscape of the South of France; and the Academy in Paris, and elected an Academy in 1898. He became a strong favourite of this group, and the public and academic and precise technical methods were widely admired by the many people who are not satisfied with altered transcriptions of natural scenes and of the passion of nature.
PAINTING

The school of animal painting is a small one, and includes only a few of marked ability. The chief members include Briton Riviere, (b. 1840; A.R.A. 1878; R.A. 1885), one of the most imaginative and inventive of living artists; J. M. Swan (1847–1910; A.R.A. 1894; R.A. 1905), trained first at Lambeth, and afterwards in Paris under Gérôme and Frémiet, a skilful manipulator and a prolific creator; and Albert Henry Collings, whose keen observation of nature and intimate understanding of animal character, mainly of the felinea (see also SCULPTURE); J.T. Nettleship (1841–1902), trained chiefly in the Slade School, whose studies of the greatest beasts of prey are admirably sincere and well painted; Miss Lucy Kemp-Welch, who, at the age of 17, painted portraits of the Hertford Dogs, which paint horses with unusual power; and John Charlton (b. 1849), trained in the South Kensington School, also well known by his pictures of horses and dogs.

The value and claim attention because of the school of animal painting for the world.

ANIMAL PAINTING.

The Scottish School.

The most active of these belong to the Scottish school, the centres of Glasgow, Edinburgh, and Aberdeen, which have produced some of the most distinguished British artists. The Royal Academy of London, indeed, with most of the other leading art societies, has been largely recruited from Scotland. There have been added to the modern list the names of Sir James M. Edmundson, J. F. Kennedy, J. Pettie, Erskine Nichol, T. Faed, David Murray, Colin Hunter, R. W. Macbeth, D. Farquharson, J. Farquharson, George Henry: all of them painters of well-established reputation; and there are many others among the Scottish school who hold a high position in their headquarters, like Arthur Melville, a portrait and subject-painter and a masterly water-colourist; E. A. Walton, who is equally successful with portraits, landscapes, and decorative compositions; J. D. Fergusson, whose landscapes and portraits are full of character and of admirable quality; John Lorimer, who has painted a number of excellent portraits; and many more. The most notable of the men who remain in Scotland include Alexander Roche, whose remarkable capacity for the school of landscape painters, fine in style and a master of effect; D. Y. Cameron, an admirable oil-painter and a famous etcher; and Sir James Guthrie, F.R.S.A., well known for his excellent portraits. Among the younger Scotch painters, Robert Gourley, a landscape painter of marked originality and sound technical method; W. McTaggart (d. 1910), the brilliant impressionist; E. A. Hornel and W. Hole, decorative painters who have produced many charming pictures; and Sir George S. Henry, whose landscapes are full of character and of admirable quality, have won the admiration of the public. The most recent of the Scotch landscape painters is Sir John Lavery, who has painted a number of the most successful landscapes and portraits. He is one of the ablest and most successful of the Scotch landscape painters, and has been much admired for the excellence of his work.

The water-colour painters can fairly be said to have kept unchanged the essential qualities of their particular form of practice.

WATER-COLOUR.

They have departed scarcely at all from the execution methods which have been recognized as correct for the medium, and have adapted them to a greater range of accomplishment, developing, it may be added, the "blessed" or the accidental manner suggestive of summary decision. Latterly water-colour painting has come to be regarded as a medium of expression, and has been used with absolute freedom by a very large number of skilful artists. Many of the men who have done the best work in this medium are known as oil painters of the highest rank; and among living water-colourists, who have done the best work in the mode of expression, may be named:

E. M. Wimperis, whose water-colours are at least as worthy of admiration as their oil pictures. As water-colourists, much credit is due to Sir E. J. Poynter for his landscapes, portraits, and figure drawing; and to Sir E. A. Waterlow for his delicately expressive landscapes; Sir Hubert von Herkomer for his admirably handled figures; and Sir George Clausen, whose pastoral compositions are filled with the beauty and grace of nature. The water-colourists are distinguished by fine qualities of colour; J. Aumonier, A. D. Peppercorn, J. S. Hill, J. W. North, Leslie Thomson, Frank Walton and R. W. Allan for landscapes of especial success; E. J. Gregory (d. 1909), and Cadogan Cowper, for figure compositions; W. M. Stanfield, for his picture of the woods; the late Sir W. J. Edmiston, for his pictures of cities and of flowers; J. R. Reid, W. L. Wylle, E. Hayes and C. N. Hemy for sea and coast pictures; R. W. Macbeth, Claude Hayes and Lionel Smythe for rustic scenes with figures in the open air; J. M. Swan for paintings of animals; and G. H. Boughton for costume subjects and delicately poetic fancies. Besides, there is a large number of artists who have been chiefly or entirely made by their successful management of water-colour, and into this list come Birkelet Foster, the head of the old-fashioned school of dainty rusticity; Carl Haag, a wonderful manipulator who has produced some of the finest water-colours in existence; Thomas Underwood, who has been an interpreter of the grains of childhood, and endowed with the greatest originality of his time, Foreman, an accomplished executant of well-imagined romantic motives; and J. R. Weggelin, one of the most facile and expressive painters of fantastic figure subjects. The art of these artists, and of the majority of British artists, is a real art of colour and of sentiment; and their works, even when produced by the most original of British artists, have been most successful in pictorial production.

Christmas, Robert Adam (Eng., 1885); Clement and Hutton, Artists of the 19th Century (Boston, U.S.A., 1885); David Martin and F. Newbery, The Glasgow School of Painting (1897); W. D. McKay, R.S.A., The Scottish School of Painting (1897); John Maclaren, The Art of His Time (1896); Gleeson White, The Master Painters of Britain (1897); E. T. Cook, A Popular Handbook to the National Galleries, vol. ii. (1901); J. E. Hodgson, R.A., Fifty Years of British Art (1875–1925); the volumes of the Monkmann, British Contemporary Artists (1899); G. R. Redgrave, History of Water-colour Painting in England 1750–1889 (1889). Also the Transactions of the National Association for the Advancement of the Fine Arts, published in London, 1858; (1881); the Catalogues of the British Institution, the Victoria and Albert Museum, and the Art Gallery of the City of London.

The period between 1870 and the opening of the 20th century was singularly important in the history of France, and consequently of her art. The internal life of the people developed on new lines with a vigour that left a deep mark on the outcome of mental effort. Literature was foremost in this new movement. The novel of Balzac, Zola, Flaubert, the brothers de Goncourt, and Maupassant, and the plays of Alexandre Dumas fils, filled as they did, with the pathos of modern life, the atmosphere of the time, opened the eyes of the young generation to the appreciation of the visible beauty and the spiritual poetry of the world around them, and helped them to view it with more attentive eyes, more insight and more emotion. The aim of art was also to emancipate itself, by the growing efforts of independent artists, from the slavery of tradition, and to devote itself to a more personal contemplation and knowledge of contemporary life under every aspect. Modern French art tends to become more and more the art of the people—a mixture of naturalism and poetry, deriving its inspiration, by preference, from the world of the working man; no longer appealing only to a restricted and more or less fastidious public, but, on the contrary, adapting its aesthetic or moral teaching to popular apprehension. The whole past was, of course, wiped out. The younger generation had to learn and profit by the lessons taught by their great precursors. To understand the true character of this recent development of French art it is needful, therefore, to glance backward.

We need not dwell on the individual authorities who constitute the official hierarchy of the contemporary French school; these masters belong for the most part, by the date of their best work, to a former generation. Starting in many cases from very opposite points, but reconciled and united by time, they carried on, during the last quarter of the 19th century, with more or less distinction, the inevitable evolution of their personal gifts.
We still see the works of some of the staunch Realists: Jean Gignoux (d. 1892), Robert-Fleury (d. 1890), Jules Dupré (d. 1886), Lami (d. 1880), Cabat (d. 1893) and Isabey (d. 1886); and through them they did not follow the main stream, and may be named François (d. 1897) and Charles Jacque (d. 1894). Next to them, Meissonier (d. 1891) crowded into the last twenty years of his life a mass of work which, for the most part, enhanced his fame; and Rosa Bonheur (d. 1899), working in retirement up to the age of seventy-seven, went on her accustomed way unmoved by external changes. Hébert, Harpignies, Ziem and Paul Flandrin survived. Among the generation which grew up under the Second Empire we find men of great intelligence and distinction; some, like Alexandre Cabanel (1824–1889), by pictures of historical genre, in a somewhat insipid and conventional style, but more particularly by female portraits, firm in flesh-painting and aristocratic in feeling; others, like Paul Baudry (1828–1886, q.v.), whose large decorative works, with their pure and lofty elegance, secured him lasting fame, and whose allegorical compositions were particularly remarkable; not less so his portraits, at first vivid, glowing and golden, but at the end of his life, under the influence of the new atmosphere, cooler in tone, but more eager, nervous and restless in feeling. Léon Gérôme (b. 1824, q.v.) was the originator, during the Second Empire, of the neo-Greek idea, an Orientalist and painter of historic genre, whose somewhat arid concept for archaeological precision and finish, despite his labours, ended in the great painting medallion and allegorical subjects in a sentimental style. Jules Lefebvre (b. 1836) had a brilliant career as a portrait painter, combined, in his earlier years, with admirable studies of the nude. These were followed by Benjamin Constant (d. 1902), a clever painter of past ages in the East and of modern Oriental life, who latterly directed his powers of vigorous and rapid brushwork to portrait-painting; Fernand Cormon, the inventive chronicler of primeval Gaul, and a solid and learned portrait painter; Aimé Morot, a man of versatile gifts, a painter of portraits full of life and ease. These formed the heart of the Institut. On the other hand, we find a group who betray a close affinity with the realist party—rejecting, like them, tradition at second-hand, though returning for direct teaching to some of the great masters. Léon Bonnat (b. 1833), educated in Spain, and preserving through a long series of official portraits an evident worship of the great realists of that nation; and again, under the same influence, Jean Paul Laurens (b. 1837), who has infused some return of vitality into historical painting by his clear and individual conceptions and realistic treatment. Jean Jacques Henner (b. 1829, q.v.), standing even more apart, lived in a Correggio-like world of antique nude forms in dim landscape scenery; his love of exquisite texture, and his unvarying sense of beauty, with his refined dilettantism, link him on each side to the great groups of realists and idealists.

About the middle of the 19th century, after the vehement disputes between the partisans of line and the vortices of colour, otherwise the Classic and the Romantic schools, when a younger generation was resting from these follies, exhausted, weary, devoid even of any fine technique, two groups slowly formed on the opposite sides of the horizon—seers or dreamers, both protesting in different ways against the collapse of the French school, and against the alleged indifference and sceptical ecticism of the painters who were regarded as the leaders. This was a revolt from the academic and conservative tradition. One was the group of original and nature-loving painters, keen and devoted observers of men and things, the realists, made illustrious by the three great personalities of Corot (q.v.), Millet (q.v.) and Courbet (q.v.), the real originators of French contemporary art. The other was the group of men of imagination, the idealists, who, in the pursuit of perfect beauty and an ideal moral standard, reverted to the dissimilar visions of Delacroix and Ingres, the ideals of rhythm as opposed to harmony, of style versus passion, which Théodore Chassériau had endeavoured to combine. Round Puvis de Chavannes (q.v.) and Gustave Moreau (q.v.) we find a group of artists who, in spite of the fascination exerted of their intelligence by the great works of the old masters, especially the early Florentines and Venetians, would not accept the old technique, but strove to record in splendid imagery the attributes of the spiritual life, claimed by studying contemporary individuals, to reveal the psychology of modern minds. Among them were Gustave Ricard (1821–1873), whose portraits, suggesting the mystical charm sometimes of Leonardo and sometimes of Rembrandt, are full of deep unuttered vitality; Elie Delaunay (1828–1891), serious and expressive in his heroic compositions, keen and striking in his portraits; Eugène Fromentin (1820–1876), acute but subtle and silvery, a man of elegant mind, the writer of Les Maîtres d’autrefois, of Sahel and of Le Saharo, the discoverer—artistically—of Algeria. And round the loud and showy individuality of Courbet—healthy, nevertheless, and inspiring—a group was gathered of men less judicious, but more stirring, more trunculent, thoroughly original, but not less reverent to the old masters than they were defiant of contemporary authorities. They were even more ardent for a strong technique, but the masters who attracted them were the Dutch, the Flemish, the Venetians, who, like themselves, had aimed at recording the life of their day. Among these was François Bonvin (1817–1887), who, following Granet, carried on the evolution of a subdivision of genre, the study of domestic interiors. This Drolling, too, had done, early in the 19th century, his predecessors in France being Chardin and Le Nain. This class of subjects has not merely absorbed all genre-painting, but has become a very important factor in the presentment of modern life. Bonvin painted assemblies, convent-life, studios, laboratories and schools. Alphonse Legros (q.v.), painter, sculptor and etcher, who settled in London, was of the same school, though independent in his individuality, celebrating with his brush and etching-needle the life of the poor and humble, and even of the vagabond and beggar. There were also Bracquemond, the reviver of the craft of etching; Fantin-Latour, the painter of highly romantic Wagnarian dreams, figure compositions grouped after the Dutch manner, and flower-pieces not surpassed in his day. Ribot, again, and Volland, daring and dashing in their handling of the brush; Guillaume Régamey, one of the few military painters gifted with the epic sense; and even Carolus Duran, who, after painting "Murdered" (in the Lille Museum), combined with the professional duties of an official teacher a brilliant career as a portrait painter. A later member of this group, attracted to it by student friendship in the little drawing-school which under Lecocq de Boisbaudran competed in a modest way with the École des Beaux Arts, was J. C. Cazin, well known afterwards as a pronounced idealist. Finally, there was Manet, a connecting link between the realists and the impressionists. These two radiate focuses of imagination and of observation respectively were to be seen still intact during the later period, as represented by the most energetic of the masters who upheld them.

After the catastrophe of 1870, French art appeared to be reawakened by the disasters of the country; and at the great exhibition in Vienna in 1873 Count Andrassy exclaimed to Léon Bonnat, "After such a terrible crisis you are up again, and victorious!" Immense energy prevailed in the studios, and money poured into France in consequence. The output increased rapidly, and at the same time study became more strenuous, and ambition grew bolder and more manly. Renewed activity stirred in the public academies, and a crowd of foreign students came to learn. Two great facts give a characteristic stamp to this new revival of French art: I. In the class of imaginative painting, the renewed impulse towards monumental or decorative work. II. In the class of nature studies, the growth of landscape painting, which developed along two parallel lines—Impressionism; and III. the "Open-air" school.

I. Decoration.—In decorative painting two men were the soul of the movement: Puvis de Chavannes and Philippe de Chenuвиères Pointel. As we look back on the last years of the Second Empire we see decorative painting sunk in profound lethargy. After Delacroix, Chassériau and Hippolyte Flandrin, and the completion of the great works in the Palais Bourbon, the Senate

House, the Cour des Comptes and a few churches—St Sulpice, St Vincent de Paul and St Germain des Prés—no serious attempts had been made in this direction. Excepting in the Hôtel de Ville, where Cabanel was winning his first laurels, and in the Opera House work that was progressing in spite of a few chandeliers only were decorated with paintings in the manner of easel pictures. But two famous exceptions led to a decorative revival: Puvis de Chavannes's splendid scheme of decoration at Amiens (all, with the exception of the last composition, which is dated 1881, executed without break between 1861 and 1867), and his work at Marseilles and at Poitiers; Baudry, with his ceiling in the Opera House, begun in 1866 but not shown to the public till 1874. There was also a movement for reviving French taste in the industrial arts by following the example of systematic teaching set by some foreign countries, more particularly by England. Decorative painting felt the same impulse. Philippe de Chennevières, curator of the Luxembourg Gallery and directeur des Beaux Arts (from 1874 till 1879), determined to encourage it by setting up a great rivalry between the most distinguished painters, like that which had stimulated the zeal of the artists of the Italian Renaissance. Taking up the task already attempted by Chenavard under the Republic of 1848, but abandoned in consequence of political changes, M. de Chennevières commissioned a select number of artists to decorate the walls of the Panthéon. The panels were to record certain events in the history of France, with due regard to the sacred character of the building. Twelve of the most noted French artists were given the selection with a liberal breadth of selection so as to include the most dissimilar styles: Millet and Meissonier, of whom one refused and the other did not carry out the work; Cabanel and Puvis de Chavannes. The last-named was the first to begin, in 1878, and he too was the painter who put the crowning end to this great work in 1880. His pictures of the Childhood of St Geneviève (the patron saint of Paris), simple, full of feeling and of innocent charm, appropriate to a popular legend, with their airy Parisian landscape under a pallid sky, made a deep impression. Thenceforward Puvis de Chavannes had a constantly growing influence over younger men. His magnificent work at Amiens, “Ludus pro Patria” (1881-1882), at Lyons and at Rouen, in the Sorbonne and the Hôtel de Ville, for the Public Library at Boston, U.S.A., and on to his last composition, “The Old Age of St Geneviève,” upheld to the end of the 19th century the sense of lofty purpose in decorative painting. Besides the Panthéon, which gave the first impetus to the movement, Philippe de Chennevières found other buildings to be decorated: the Luxembourg, the Palace of the Legion of Honour and that of the Council of State. The paintings in the Palais de Justice, the Sorbonne, the Hôtel de Ville, the College of Pharmacy, the Natural History Museum, the Opéra Comique, and many more, bear witness to this grand revival of mural painting. Every kind of talent was employed—historical painters, portrait painters, painters of allegory, of fanciful scenes, of real life and of landscape. Among the most important were: J. P. Laurens and Benjamin Constant, Bonnat and Carolus Duran, Cormon and Humbert, Joseph Blanc and L. Olivier Merson, Roll and Gervex, Besnard and Carrière, Harpignies and Pointelin, Raphaël Collin and Henri Martin.

II. Impressionism. In 1874 common cause was made by a group of artists drawn together by sympathetic views and a craving for independence. Various in their tastes, they concentrated from every point of the compass to protest, like their precursors the realists, against the narrow views of academic teaching. Some had romantic proclivities, as the Dutchman Jongkind, who played an important part in founding this group; others were followers of Daubigny, of Corot or of Millet; some came from the realistic party, whose influence and effort for this new set was to carry on. Among these, Édouard Manet (1832-1883) holds a leading place; indeed, his influence, in spite of—or perhaps as a result of—much abuse, extended beyond his circle even so far as to affect academic teaching itself. He was first a pupil of Couture, and then, after Courbot, his real masters were the Spanish—Velasquez, El Greco and Goya—all of whom he closely studied at the beginning of his career; but he soon felt the influence of Millet and of Corot. With a keen power of observation, he refined and lightened his style, striving for a subtle rendering of the exact relations of tone and values in light and atmosphere. With him, forming the original group, as represented by the Callebotte collection in the Luxembourg, we find some landscape painters: Claude Monet, the painter of pure daylight, and the artist who by the title of one of his pictures, “An Impression,” gave rise to the designation accepted by the group; Camille Pissarro, who at one time carried to an extreme the principle of dotting with pure tints, known as pointilleism, or dot work; Sisley, Cézanne and others. Among those who by preference studied the human figure were Édgar Degas (q.v.) and Auguste Renoir. After long and violent antagonism, such as had already greeted the earlier innovators, these painters, in spite of many protests, were officially recognized both at the Luxembourg and at the great Exhibition of 1900. Their aims have been various, some painting Man and some Nature. In the former case they claim to have gone back to the principle of the greatest artists and tried to record the life of their own time. Manet, Degas and Renoir have shown us aspects of city or vulgar life which had been left to genre-painting or caricature, but which they have represented with the charm of pathos, or with the bitter irony of their own mood, frank transcripts of life with a feeling for style. For those who painted the scenery of nature there was an even wider field. They attempted to give to the work a new visual sense, released from the clinging memories of past art; they endeavoured to fix the transient effects of moving life, changing under the subtlest and most fugitive effects of light and atmosphere, and the play of what may be called the elements of motion—sunshine, air and clouds—caring less for the exact transcript of motionless objects, which had hitherto been almost exclusively studied, such as the soil, trees and rocks, the inanimate features of the landscape. They introduced a fresh lightness of key, which had been too servile to the relations of values; they discovered for their ends a new class of subjects essentially modern: towns, streets, railway stations, factories, coal-mines, ironworks and smoke, which they represent with an intelligent adaptation of Japanese art, taking new and audacious points of view, constantly varying the position of their horizon. This is indeed the very acme of naturalism, the last possible stage of modern landscape, covering the whole field of observation, doubling back to the starting-point of imagination. Notwithstanding—or because of—the outcry, of these views, peculiarities and tendencies so often penetrated schools and studios. Three artists in particular became conspicuous among the most individual and most independent spirits: Besnard, who had taken the Grand Prix de Rome, and carried to the highest pitch his inexhaustible and ever changing fancy in studies of the figure under the most unexpected play of light; Carrière, a pupil of Cabanel, who sought and found in mysterious gloom the softened spirit of the humble, the warm caress of motherhood; and Raffaelli, a pupil of Gérôme, who brought to light the unrecognized picturesqueness of the lowest depths of humanity.

III. The “Plein-air,” or Open-air, School. The same causes explain the rise of the particular class of work thus commonly designated. Between Millet and Courbet, both redolent of the romantic and naturalistic influences of their time, though apart from them, stands an artist who had some share in establishing the continuity of the line of painters who combined figure-painting with landscape. This is Jules Breton (b. 1827, q.v.). More supple than his fellows, less harsh and less wilful, caring more for form and charm, he found it easier to treat “masses,” and contributed to diffuse a taste for the artistic presentment and glorification of field labour. He was the chief link between a past style and Jules Bastien-Lepage (1848-1884, q.v.), who was in fact the founder of the school of open-air painting, a compromise between the academic manner and the new revolutionary ideas, a sort of academic continuation of the naturalistic evolution, which therefore exerted considerable influence on contemporaneous art. As a pupil of Cabanel and the Academy schools,
enamoured of rustic life, he absorbed at an early stage, though not without hesitation, the love of atmospheric effects characteristic of Courbet and of Manet. In his open-air heads and rural scenes he is seen as a conscientious nature worshipper, accurate and sincere, and, like Millet, imbued with a touch of mysticism which becomes even more evident in his immediate pupils. Round him there arose a little galaxy of painters, some more faithful to tradition, some followers of the best innovators, who firmly tread this path of light and modern life. These are Butin, Duret and Renouf, Roll and Gervex, Dagnan-Bouveret, Friant, Adolphe and Victor Binet and many more.

Immediately after the Exhibition of 1889 an event took place which was not without effect on the progress of French art. This was the schism in the Salon. The audacious work of the Société Nationale des Beaux Arts, which left anything that the Impressionists could do far behind, had accustomed the eyes of the public to the most daring attempts, while the numerous contributions of foreigners, especially from this tendency, were considered at first presentation of daily life, was a fresh encouragement to the study of modern conditions and of the lower classes. But, at the same time, the encroachment on space at the Exhibition (where no limit of number was imposed) by mere studies, hastened the reaction against the extravagances of the degenerate followers of Courbet, Manet and Bastien-Lepage. Remonstrances arose against their perverse and narrow-minded devotion to "truth," or rather to minute exactitude, their pedantry and affectation of documentation; sometimes derived from some old colourists who had not renounced their former ideal, sometimes from younger men impelled unconsciously by literature, which had as usual preceded art in the revolt. The protest was seen, too, in a modified treatment of landscape, which took on the warmer colours of sunset, and in a choice of religious subjects, such as a pardón, or a funeral, or a ceremonial benediction, and generally of more human and more vividly defined scenes. Bastien-Lepage, like his great precursor Millet, bore within him the germs of a reaction against the movement he had helped to promote. Dagnan-Bouveret, who began by painting "Sitting for a Photograph" (now at Lyons) and "An Accident," after painting "Le Pain bénit," ended with "The Pilgrims to Emmaus" and "The Last Supper," Friant, again, produced scenes of woe. "All Saints' Day" and "Grief"; and their younger successors, Henri Royer, Adler, Duvent and others, who adhered to this tradition, accommodated it to a more modern ideal, with more vivid colouring and more dramatic composition.

Still, this normal development could have no perceptible effect in modifying the purpose of painting. More was needed. A strong craving for imaginative work was very generally felt, and was revealing itself not merely in France but in Belgium, Scotland, America and Germany. The French were long in groups forming round certain well-known figures. Thus a group of refined dreamers, of poetic dilettanti and harmonious colourists, assembled under the leadership of Henri Martin (a strange but attractive visionary, a pupil of Jean Paul Laurens and direct heir to Puvis de Chavannes, from whom he had much sound teaching) and of Aman-Jean, who had appeared at the same time, starting, but with more reserve, in the same direction. Some of this younger group affected no specific aim; the others, the larger number, leant towards contemporary life, which they endeavoured to depict, especially its aspirations and—according to the modern expression now in France of common usage—its "state of soul" typified by melody of line and the eloquent language of harmonies. Among them should be named, as exhibitors in the salons and in the great Exhibition of 1900, Ernest Laurent, Ridel and Hippolyte Fournier, M. and Mme H. Duham, Le Sidaner, Paul Steck, &c. On the other hand, a second group of sturdy and fervent naturalists, in some ways resembling the school of 1855 of which mention has been made; young and bold, sometimes over-bold, enthusiastic and emotional, and bent on giving expression to the life of their own day, especially among the people, not merely recording its exterior aspects but epitomising its meaning by broad and strong synthetic compositions. At their head stood Cotet, who combined in himself the romantic fire and the feeling for orchestrated colour of Delacroix with the incisive realism and bold handling of Courbet; next, and very near to him, but more objective in his treatment, Lucien Simon, a manly painter and rich colourist. Both by preference painted heroic or pathetic scenes from the life of Breton mariners. After them came René Ménard, a more lyrical artist, whose classical themes and landscape carried us back to Poussin and Dauchez, Prinet, Wéry, &c. Foreign influences had meanwhile proved stimulating to the new tendencies in art. Sympathy with the populace derived added impulse from the works of the Belgian painters Constantin Meunier, Léon Frédéric and Struys; a taste for strong and expressive colouring was diffused by certain American artists, pupils of Whistler, and yet more by a busy group of young Scotsmen favourably welcomed in Paris. But the most unforeseen result of this reactionary movement was a sudden reversion to tradition. The cry of the realists of every shade had been for "Nature!" —The newcomers raised the opposition cry of "The Old Masters!"—And in their name a protest was made against the narrowness of the documentary school of art, a demand for some loiter scheme of conventionalism, and for a fuller expression of life, with its complex aspirations and visions. The spirit of English Pre-Raphaelitism made its way in France by the medium of translations from the English poets Shelley, Rossetti and Swinburne, and the work of their followers Stephen Mallarmé and Le Sâr Peladan; it gave rise to a little artificial impetus, which was furred by the simultaneous but transient rage for the works of Burne-Jones, which were exhibited with his consent in some of the salons, and by the importation of William Morris's principles of decoration. The outcome was a few small groups of symbolists, the most famous being that of Gustave Moreau, whose studio was a center to Les Primitifs (organized by Le Sâr Peladan); then there was Henri Martin, and the little coterie of exhibitors attracted by a dealer, the late M. le Bare de Boultville, in which Cotet was for a short time entangled. But few interesting names to be identified: Dulac (d. 1890), who became known chiefly for his mystical lithographs in colour; Maurice Denis and Bonnard, whose decorative compositions, with their refined and harmonious colouring, are not devoid of charm; Vuillard, &c. But it was in the school and studio of Gustave Moreau (1826-1898, q.r.) that the fire of idealism burned most hotly. This exceptional man and rare painter, locked up in his solitude, endeavoured, by a thorough and intelligent assimilation of all the traditions of the past, to find and create for himself a new tongue—rich, nervous, eloquent, strong and resplendent—in which to give utterance to the loftiest dreams that haunt the modern soul. He revived every old myth and rejuvenated every antique symbol, to represent in wonderful imagery all the serene magnificence and all the terrible struggles of the moral side of man, which he had explored to its lowest depths and most heroic heights in man and woman, in poetry and in death. Being appointed, towards the end of his life, to a professorship in the École des Beaux Arts, he regarded his duties as a real apostleship, and his teaching soon spread from his lecture-room and studio to those of the other masters. His own work, though hardly known to his pupils at the time, at first influenced their style; but, especially after his death, they were quickly disgusted with their own detestable imitation of subjects on which the master had set the stamp of his great individuality; they deserted the fabulous world of the Greek Olympus and the wonderful gardens of the Bible, to devote them to a passionate expression of modern life. Desvilleières, indeed, remained conspicuous in his original manner; Sabatté, Maxence, Béroneau, Besson and many more happily worked on their way on other lines.

In trying to draw up the balance-sheet of French art at the beginning of the 20th century, it was vain to try to enter its work under the old-world headings of History, Genre, Portraits, Landscape. All the streams had burst their channels, all the currents mingled. Historical painting, reinstated for a
time by Puvís de Chavannes and J. P. Laurens, in which Benjamin Constant and Coromandel also distinguished themselves, had but a few adherents who tried to maintain its dignity, either in combination with landscape, like M. Tatge of Belgium, or with the picturesque aid of archaeology, like M. Rochegrosse. At certain times, especially just after 1870, the memory of the war gave birth to a special genre of military subjects, under the distinguished guidance of Meissonier (q.v.), and the peculiar talents of Alphonse de Neuville (q.v.), of Détaille (q.v.) and Protains. This phase of contemporary history being exhausted, gave way to pictures of military manoeuvres, or colonial wars and incidents in recent history; it latterly went through a revival under a demand for subjects from the Empire and the Revolution, in consequence of the publication of many memoirs of those times. By side by side with "history," religious art formerly flourished greatly; indeed, next to mythology, it was always dear to the Academy. Apart from the subjects set for academical competitions, there was only one little revival of any interest in this kind. This was a sort of neo-evangelical offshoot, akin to the literature and spirit of religious discussion; and its leader, a man of feeling rather than conviction, was J. C. Cazin (d. 1905). Like many others, and under the influence of Corot and Millet, of Hobbema, and of Rembrandt, he attempted to renew the vitality of history and legend by the added charm of landscape and the introduction of more human, more living and more modern elements into the figures and accessories. Following him, a little group developed this movement to extravagance. The recognized leader at the beginning of the 20th century was Dagnan-Bouveret.

Through mythology and allegory we are brought back to real life. No one now thinks in France of seeking any pretext for displaying the nude beauty of woman, Henner, perhaps, and Fantin-Latour, were the last to cherish a belief in Venus and Artemis, in naiads and nymphs. Painters go direct to the point nowadays; when they paint the nude, it is apart from abstract fancies, and under realistic aspects. They are content with the model. It is the living female. The whole motor force of the time lies in the expression, under various aspects, of real life. This it is which has given such a soaring flight to the two most primitive forms of the study of life, landscape and portraiture. Like many others, and under the influence of Corot and Millet, of Hobbema, and of Rembrandt, he attempted to renew the vitality of history and legend by the added charm of landscape and the introduction of more human, more living and more modern elements into the figures and accessories. Following him, a little group developed this movement to extravagance. The recognized leader at the beginning of the 20th century was Dagnan-Bouveret.

Painting Belgium

Belgium fills a great place in the realm of art; and while its painters show a preference for simple subjects, their technique is broad, rich and sound, the outcome of a fine tradition. Since 1855 international critics have been struck by the unity of effect produced by the works of the Belgian school, as expressed more especially by similarities of handling, and the coloristic. For the things which distinguish all Belgian painters, even in their most unpictorial vagrations, are a strong sense of contrast or harmony of colouring, a free, bold style of brushwork, and a preference for rich and solid painting. It is the tradition of the old Flemish school. It would be more correct, indeed, to say traditions; for the modifications of each tendency, inevitably reviving when the success of another has exhausted itself, constantly show a reversion either to the domestic "Primitives" (or, as we might say, Pré-Raphaelites) of the Bruges school, or to the "decorative" painters of the later time at Antwerp, and no veneer of modern taste will ever succeed in masking this traditional perennial groundwork. In this way the prevailing authority of the French painter Louis David may be accounted for; as acknowledged at Brussels at the beginning of the 19th century, it was a reaction in antagonism to the heavy and flabby work of the late Antwerp school, an unconscious reversion perhaps to the fresh and minuteinct of the early painters of Bruges. Indeed, in France, Ingres, himself David's most devoted disciple, was, in his old age, as one modern writer says, a "Jean de Bruges." Then, when David's followers produced only cold and feeble work, Wappers arose to restore the methods of another tradition, for which he secured a conspicuous triumph. Classical tinsel made way, indeed, for romantic tinsel. The new art was as conventional as the old, but it had the advantage of being adaptable to the taste for show and splendour which characterizes the nation, and it also admitted the presentment of certain historical personages who survived in the memory of the people. The inevitable reaction from this theatrical art, with its affectionation of noble sentiments, was to brutal realism. Baron Henri Leys (q.v.) initiated it, and the crudity of his style gave rise to a belief in a systematic purpose of supplanting the Latin tradition by Germanic sentimentality. Leys's archaic realism was transformed at Brussels into a realism of observation and modern thought, in the painting of Charles de Groux. The influence of Leys on this artist was merely superficial; for though he, too, affected painful subjects, it was because they appealed to an emotional bent. The principle represented by de Groux was destined to pioneer the school in a better way; and at the same time, from another side the authority of Courbet, the French realist, who had been for some time in Brussels, and that of the great landscape painters of the Fontainbleau school, had suggested to artists a more attentive study of nature and a remarkable reversion in technique to bolder and firmer handling. At this time, among other remarkable men, Alfred Stevens appeared on the scene, the finished artist of whom Camille Lemonnier truly said that he was "of the race of great painters, and, like them, careful of finish"—that in him "the eye, the hand and the brain all co-operated for the mysterious elaboration" of impasto, colour and chiarosuro, and "the least touch was an operation of the mind." A brief period ensued during which the greater number of Belgian artists were carried away by the material charms of brushwork and paint. The striving after brilliant efforts of colour which had characterized the painters of the last generation then gave way to a devout study of values; and at the same time it is to be noted that in Belgium, as in France, landscape painters were the first to discover the possibility of giving new life to the interpretation of nature by simplicity and sincerity of expression. They tried to render their exact sensations; and we saw, as has been said, "an increasingly predominant revelation of instinctive feeling in all classes of painting." Artists took an impartial interest in all they saw, and the endeavour to paint well eliminated the hope of expressing a high ideal; they now sought only to utter in a work of art the impression made on them by an external fact; and, too often, the strength of the effort degenerated into brutality.

These new influences, which, in spite of the conservative school, had by degrees modified the aspect of Belgian art in...
general, led to the formation at Brussels of an association under the name of the Free Society of Fine Arts. This group of painters had marked influence on the development of the school, and hand in hand with the pupils of Portela—a teacher of sober methods, caring more for sound practice than for theories—it encouraged not merely the expression of deep and domestic feeling which we find in the works of Leys and de Groux, but also the endeavour to paint nature in the broad light of open air. The example of the Free Society found imitators; various artistic groups were formed to organize exhibitions where new works could be seen and studied irrespective of the influence of dealers, or of the conservatism of the authorities which was increasingly conspicuous in the official galleries; till what had at first been regarded as a mere audacious and fantastic demonstration assumed the dignity of respectable effort. The "Cercle des Vingt" ("The Twenty Club") also exerted a marked influence. By introducing into its exhibitions works by the greatest foreign artists it raised Belgian art from the uniformity which some too patriots found hostile to native talent. The "Cercle des Vingt" was asserted there in a really remarkable manner, for side by side with the experiments of painters bent on producing certain effects of light hung the works of men who clung to literary or abstract subjects. Other groups, again, were formed on the same lines; but then came the inevitable reaction from these elaborations of quivering light and subtle expression, pushed, as it seemed, to an extreme. The youngest generation of Brussels painters, in revolt against the earlier work and ultra-refinements of their immediate predecessors, seem to take pleasure in a return to gums and bitumen, and to buy the violent effects so dear to the romantic painters of a past time.

Brussels is the real centre of art in Belgium. Antwerp, the home of Rubens, is resting on the foundations of past glory, after vainly trying to uphold the ideal formerly held in honour by Flemish painters. And yet, so great is the prestige of this ancient city, that the newcomers trace their genealogies from every land, and more especially the dealers who go thither to buy pictures as a common form of merchandise. At Ghent the wonderful energy of the authorities who get up the triennial exhibitions makes these the most interesting provincial shows of their kind; other towns, as Liège, Tournay, Namur, Mons and Spa also have periodical exhibitions.

From 1830, in the early days of the Belgian school of painting, we may observe a tendency to seek for the fullest qualities of color in the flashes of daylight; this impetus was led the way. At a time when his teachers in the Antwerp Academy would recognize nothing but the heavy brown tones of old paintings, he was already representing the transparent shadows of natural daylight. But heroic and sentimental romanticism was already crying for the expression of the spirit of natural and popular feeling, and thenceforward the prominence assumed by genre, and yet more by landscape, led to a deeper and more direct study of the various aspects of nature. At the same time a special sense of colour, the leading characteristic of the artists of the time, it was truly said that "the ambition to be a fine painter was stronger than the desire for scrupulous exactitude." Artists evidently aimed at the first place, at a solid impasto and glowing colour; an undertone of significance, a more aristocratic touch, the leading characteristics of the older school. In this way we may certainly recognize the influence of the French colourists of Courbet's time; just as we may trace the influence of the grey tonality in Manet's day in the work of these modern men. Rembrandt's formula of pink-over-painting, which became evident when the "Free Society" was founded at Brussels, and the pupils from Portela's studio came to the front. Among the artists who were then working the following must be mentioned: Jean Delvin, "The Painter and His Model," Francois-Vincent Coosemans, a draughtsman of the time, a careful study of light, by "The North Sea," besides Robert Mols, A. Bouvier, and Lemayeur.

As painters of town scenery may be named F. Stroobant, a draughtsmen rather than a painter, who is represented in the Brussels Gallery by "The Street Market by Night"; J. B. Van Meer, a colourist chiefly, by "The Cathedral at Belem.

The flower painter, Jean Robie, has the Brussels Gallery "Flowers and Fruit." Among the still-life painters of what is known as the "neutral tint" school (l'Ecole du gris) are: Théodore Baron, faithful to the stern features of Belgian scenery, represented in the Brussels Gallery by "A Winter Scene—Condroz"; Adrien Joseph Hermans, "The Broad Bow Window," a careful study of light, by "The Old Hornbeams at Tervueren." "The Meuse at Hastière"; Alfred de Knyff, noble and elegant, by "The Marl Pit," "A Heath—Campine"; Joseph Coosemans, by "A Marsh—Campine"; Jules Montigny, by "The Dog-Market at Brussels"; Edouard Agneessens, a genuine painter, with breadth of vision and facile execution, by portraits; André Hennebicq, a painter of historical subject, by "Labourers in the Campagna, Rome." Isidore Vincotte, a landscapist and portrait painter, by "The Landscape of Old Zeeland"; Eugène Verdery and Émile Clarâtre should be mentioned, and the landscape painter Henri van der Hecht, whose "On the Sandhills" is in the Brussels Gallery.

Among the landscape painters who may be added to this group are: Charles Hermans, whose picture "Dawn" (Brussels Gallery), exhibited in 1875, betrays the ascendancy of the principles upheld by the Free Society of Fine Arts; Jean de la Hoese, who has since made portraits, a historical painter, by "The Holy Family," etc.; Emile Mariette, a painter of the cheerful brightness of the Flemish country, by "A Heath," besides Isidore Meyers and Florent Crabbeels.

Still life painters who may be added to this group are: Charles Hermans, whose picture "Dawn" (Brussels Gallery), exhibited in 1875, betrays the ascendancy of the principles upheld by the Free Society of Fine Arts; Jean de la Hoese, who has since made portraits, a historical painter, by "The Holy Family," etc.; Emile Mariette, a painter of the cheerful brightness of the Flemish country, by "A Heath," besides Isidore Meyers and Florent Crabbeels.

Three more artists were destined to greater fame: Constantin Meunier, a highly respected artist, equally a painter and sculptor, known as the Millet of the Flemish workman, who has depicted with noble feeling his admirations and pity for one contemporary state of the human race, and who is represented in the Brussels Gallery by "The Potter's Wheel"; Henry Monnier, a painter of the Bourgeois; "The Green Woman," is represented in the Brussels Gallery, and Jean Milit, a masterly painter, powerful but coarse, by "A Farm Interior." Three more artists were destined to greater fame: Constantin Meunier, a highly respected artist, equally a painter and sculptor, known as the Millet of the Flemish workman, who has depicted with noble feeling his admirations and pity for one contemporary state of the human race, and who is represented in the Brussels Gallery by "The Potter's Wheel"; Henry Monnier, a painter of the Bourgeois; "The Green Woman," is represented in the Brussels Gallery, and Jean Milit, a masterly painter, powerful but coarse, by "A Farm Interior."
The Witch." Franz Vincet, Wilhelm Geets, Karl Ooms, and P. van der Oudera, endeavoured to perpetuate, while softening down, the style of historical painting so definitely formulated by Lévy. Finally, Joseph Stallaert, a painter of classical subjects, is represented in the pages of the "XX," and the essential effort of Eugène Devaux, a remarkable draughtsman, should also be named.

Works by all those artists were to be seen in the Historical Exhibition of Belgian Art at Brussels, 1880. Camille Lemonnier, in his three solo exhibitions, incomparably stood out in the course of the "XX". He was the last of a line representing the old school of fine art, and of mystical art, as represented by Gustave Moreau; H. van der Velde, a well-known exponent of the new methods in art; J. Ensor, a whimsical nature, loving strange combinations of old and new; M. Devrient, a painter of visions represented in violent tones and workmanship; G. Vogels, a painter of thaw and rain; G. van Strijdonck, R. Wytmsen, J. Delvin, F. Charlet, Mie A. Bouch, all of whom have striven to bring light into their pictures; W. Finch and G. Lemmens. To the triennial salons, to the exhibitions of the "Artists' clubs," to the House of Art (Maison d'art), at Brussels, and to the various Antwerp clubs, the following have contributed: F. Courtens, Rosselet's brilliant pupil, an astonishing painter with a heavy impact (Brussels Gallery: "Coming out of Church"); J. de Lalaing, full of lofty aims, but showing in his painting the qualities of a sculptor (Brussels Gallery: "A Prehistoric Hunter"); E. Claus, a lover of bright colour, and a genuine landscape painter (Brussels Gallery: "A Flock on the Road"); A. Baertson, who delights in the quiet corners of old Flemish towns; H. Evenepoel, a fine artist whose premature death deprived the Belgian school of a highly distinguished personality (Brussels Gallery: "Child at Play"); G. Vanaise, M. Devrient, E. Verhaeren, A. Jans, E. Motte, an interesting painter of a love of archaic methods (Brussels Gallery: "A Girl's Head"); A. Lévéque, an accomplished draughtsman with a distinctive touch; L. Wolles, an admirable picture of the "Brussels Garden" (Brussels Gallery: "An Impressionist Painter"); L. de Cotte, a skilful portrait painter; J. van den Eeckhout, a clever pupil of Verheyden; J. Rosier, a skilful follower of Verlat; L. Abry, a painter of military subjects; E. Carpentier, E. Vanhove, Lyuten and Desmet.

There is a group of artists at Liége whose sincerity and high tone are well known to the art world. Among them are E. Berchmans, F. Marechal, Dewitte, of lady painters: Mmes E. Bonnaert, H. Héger and J. Wytmsen paint landscapes; Mmes B. Art, A. Ronner, G. Meunier and M. De Bièvre paint flower pictures. There are also the following: Mme E. Vanhemelryck, a clever draughtsman; J. Delville, founder of the salons of idealist art.

Leading exhibitors at the "Voorwaarts" clubs have been E. Laermans, a strange artist, as it were a Daumier with anchylose joints, but a great artist in his work, J. van den Bossche, an admirable colourist, and the clever pupil of Courtauds (Brussels Gallery: "The Kennel"); J. du Jardin, the writer of L'Art flamand, an important critical work illustrated by J. Middelaer.

Contributors to the exhibitions of the "Sillon" comprise G. M. Stevens, P. Verduussen, P. Matthieu, J. Gouweloo, Bastien, Blicke, Wagemans and Smeeurs; and V. Mignot, ingenuous in designing posters. At the exhibitions of water-colours have been the works of Stallaert, F. Bingé, D. Lyttersehout, Stacquet and H. Walsers, who work with light washes or a clever use of body colour; Hagemans, who paints with broad washes; Delaunois, the painter of mysterious interiors; Th. Lybaert, minute in his brushwork; M. Romberg and Tizot, correct draughtsmen.

Since 1870 several important works of decorative painting in public buildings have been carried out in Belgium. Guiffens, Swarts and Pauws have succumbed to the influences of German art, and of course the "Artists' clubs" at Brussels and Van der Oudera have followed more or less in the footsteps of Lévy. J. Stallaert has cleverly revived a classic style. Emile Wauters and A. Hennebicq have adopted the traditions of Historical art, yet they are not without a certain drama and A. Bourlaud, though with a more decorative sense of conception and treatment. But of all these works, certainly the most remarkable in its artistic and intelligent fitness is that of M. Delbecq, in the monumental work of the "Laeken." See also:

(H. K.)

**HOLLAND**

The entire Impressionist movement of the end of the 19th century failed to exercise the slightest influence upon the Dutch. They are only modern in so far as they again resort to the
the proud distinction of being the enfant terrible of modern exhibitions, and his works appear to belong rather to the art of the old Assyrians than to the 19th century. But those who will endeavor to enter into their artistic spirit will soon discover that Toorop is deserving of more than a mere shrug of the shoulder; they will find that he is a great painter, who independently pursues original aims. At the present time all criticism of art is determined by the "line." All caprices and whims of the "line" are now rigid as much to death, and with the same enthusiasm, as were formerly those of "light." Toorop occupies one of the first places among those whose only aim consists in allowing the "line" to talk and make music. His astonishing power of physical expression may be noted. With what simple means, for example, he renders in his picture of the "Sphinx" all phases of hysterical desire; in that of "The Three Brides" unlike resignation, chaste devotion and unbridled voluptuousness. If his mastery over gesture, the glance of the eye, be remarked—how each feature, each movement of the hand and head, each raising and closing of the eyelid, exactly expresses what it is intended to express—Toorop's pictures will no more be scoffed at than those of Giotto, but he will be recognized as one of the greatest masters of the "line" that the 19th century produced.

GERMANY

The German school of painting, like that of France, entered on a new phase after the Franco-German War of 1870. An empire had been built up of the agglomeration of separate states. Germany needed no longer to gaze back admiringly at older and greater epochs. The historical painter became neglected. Not the heroic deeds of the past, but the political glories of the new empire were to be immortalized. This transition is particularly noticeable in the work of Adolf von Menzel. At the time of political stagnation he had recorded on his canvas the glories of Prussia in the past. Now that the present had achieved an importance of its own, he painted "The Coronation of King William at Königsberg" and "King William's Departure for the Army"; and ultimately he became the painter of popular subjects. The motley throng in the streets had a special fascination for him, and he loved to draw them in their variegated and dancing state. Pushing its eager way to listen to a band on the promenade, in the street, or at the theatre, he studied the windows of a café. He discovered the poet of the builder's yard and the workshop. In the "Moderne Cyklopen" (Ironworks), painted in 1876, he left a monumental mark in the history of German art; for in this picture he depicts a simple incident in daily life, without any attempt at genre; and this was indeed the characteristic of his work for the next few years. Humorous anecdote, as represented by Knaus (b. 1829), Vautier (1829-1899), Defregger (b. 1835) and Grützner (b. 1840), found little acceptance. Serious representations of modern life were required; resort was made to all the expedients of the great painters, and the 'seventies were years of artistic study for Germany. Every great colourist in the past was thoroughly studied and his secrets discovered. In Germany, Wilhelm Leibl (b. 1844), holds the same prominent place that Courbet does in France. Leibl, like Courbet, (p. 492), showed that the task of painting is not to narrate, but to depict by the most convincing means at its disposal. He even went farther than Courbet in close scrutiny of nature. With loving patience he strove to translate nature with the devotion of the medieval artist. No feeling, strictly speaking, is discernible in his work. His greatest pictures are only of quiet life, with human accessories, and his painful accuracy divests his pictures of poetry. But when he first appeared, he was necessary. His painting of "Three Peasant Women in Church" is a grand documentary work of that period, whose first aim was to conquer the picturesque. Leibl taught artists to study detail, to master the secrets of flower, leaf and stalk.
A great number of pupils were encouraged by him to gain such a thorough mastery of every detail of technique as to be enabled to paint pictures that were thoroughly good in workmanship, irrespective of genre or anecdote. Among these, W. Trübner (b. 1852) stands pre-eminently as a painter. His works during the 'seventies are among the best painting done at Munich during that period; they are full and rich in colour, broad and bold in their treatment of the subject. A contemporary of his was Bruno Pighlein (b. 1848), a German Chaplin in this Courbet group, not heavy and matter-of-fact, but bold and witty. He revived the art of pastel painting and pointed the way to a new style in panoramic and decorative painting, whilst infusing beauty and grace into all his works.

The movement in applied arts which began at this time is also important. The revival of the German Empire led to a renaissance in German taste. The "old German dwelling-rooms," which now became the fashion, could only be hung with pictures in keeping with the style of the old masters, and this entailed a closer study and imitation of their works than had hitherto been customary. Wilhelm Diez (b. 1839) at the head of the group, was as well acquainted with the epoch from Dürer and Holbein to Ostade and Rembrandt as any art historian. In Harburger (b. 1846) Adrian Brouwer lived once more; and in Löfftz (b. 1845) Quintin Matsys. Claus Meyer (b. 1846) imitated all the artistic tricks of Pieter de Hooch and Van der Neer of Delft; Herrmann's costume-studies were at first models for Fritz August Kaulbach (b. 1859). Later, he extended his studies to Dölci and Van Dyck, to Watteau and Gainsborough. Adolf Lier (1827-1882) applied the beauty of tone beloved by the old masters to landscape, Von Lenbach's works show the zenith of old-master talent in Germany. He had educated himself as a copyist of classical masterpieces, and passed through a schooling in the study of old masters such as none of his contemporaries had enjoyed. The copies which, as a young man, he made for Count Schack in Italy and Spain are among the best the brush has ever accomplished. Titian and Rubens, Velazquez and Giorgione, were imitated by him with equal success. In like manner he gave to his own works their distinguished old-master charm. More than all other painters of historical subjects, Lenbach enjoys the distinction of having been the historian of his epoch. He gave the great men of the era of the emperor William I. the form in which they will live in German history, and beauty of colour is blended in all these pictures with their brilliant evidence of thought. The aspirations of a whole generation to restore the technique of the old masters were his realisation in Lenbach.

Now we must not forget how, at this time, when there was imported from France the desire to paint light and sun. It was argued that the views which the old masters held concerning colour were in glaring contradiction to what the eye actually saw. The old masters, it was said, paid particular attention to the conditions of light and shade under which they did their work. The golden character of the Italian Renaissance was traceable to the old cathedrals lighted by stained-glass windows. The light and shade of the Netherlands were in keeping with the light and shadow of the artists' studios lighted by little panes, and due partly to the fact that their pictures were intended to hang in dreamy, brown panelled chambers. But was this golden or brown light suitable for the 19th century? Were we not illogical, when for the sake of reproducing the tones of the old masters, we darkened our studios and shut out the daylight by coloured glass windows and heavy curtains? Was not light one of the greatest acquisitions of recent times? When the Dutch painted the world used only little panes of glass. Now the daylight streamed into our rooms through great white sheets of crystal. When our grandfathers lived there were only candles and oil lamps. Now we had gas and electric light. Instead of imitating the old masters, could not we paint the colourful charms that were unknown to them. Let us do honour to the new marvels of colour. With such arguments as were advanced in France, did artists in Germany adopt the plein-air and abandon older methods; and a development like that which took place in France after the days of Manet ensued in Germany also. Daylight, which had so long been kept down, was now to be reproduced as clear and bright. After the art of painting strong effects full of daylight had been grappled with, other and more difficult problems of light effects were attempted. After the full blaze of sunshine had been successfully reproduced, such effects as the haze of early morning, the sultry vaporous atmosphere of the thunderstorm, the mysterious night, the blue-grey dawn, the delicate colours of variegated Chinese lanterns, the scintillation of gas and lamplight, and the dreamy twilight in the interior were dealt with.

Max Liebermann (b. 1849) was the first to join the new departure. In Paris he had learnt technique. Holland, the country of fogs, inspired him with the love for atmospheric effects, and its scenes of simple life provided him with many subjects. Perhaps the "Net Menders" in the Hamburg Kunsthalle is most typical of Liebermann's art. Frank Skarbina (b. 1849), who was the second to join the new movement in Berlin, proceeded to studies of twilight and artificial light effects.

Hans Herrman (b. 1858), who settled himself on quays and ports; Hugo Volgel, who endeavoured to utilize scenes from contemporary life for decorative pictures; and the two landscape painters, Ludwig Dettman (b. 1865) and Walther Leistikow (b. 1865), are other representatives of modern Berlin art. Carlsburg in the eighties, produced some modern pictures of great merit, when Gustav Schönlieber (b. 1853) and Hermann Bauch (b. 1849) showed daintily conceived pictures of Dutch landscapes. In later years Count Leopold Kalckreuth (b. 1855), whose powerfully conceived representations of peasant life belong to the best productions of German realism, and Victor Weisbahn (b. 1848), the animal painter, removed thence to Stuttgart, the residence also of Otto Reiniger (b. 1863), a landscape painter of great originality. At Dresden we find Gotthard Kuehl (b. 1850), long domiciled in Paris, who was one of the first to accept Manet's teaching. In North Germany, Worpswede became a German Barbizon; Ende (b. 1860), Vogeler, and Vinnen (b. 1863) also worked there. In Weimar, two landscape painters of great refinement must be mentioned—Theodor Hagen (b. 1842) and Gleichen-Russwurm (b. 1866). As far back as the 'seventies they rendered ploughed fields, hills enveloped in thin vapour at sunrise, waving fields of corn, and apple trees in full bloom trembling in the rays of the evening glow with a delicate understanding of natural effects.

But Munich still remains the headquarters of German art, which is there the first of all interests and pervades all circles. Almost all those who are working in other German towns receive much and their impressions are the same as remained its citizens in heart. The international exhibition of Munich was given a great European tone and impulse to creative work. Among the elders, Albert von Keller (b. 1841) has perhaps the greatest originality. He is one of those who practised the art of the brush as long ago as the 'seventies, and painted, not for the sake of historical subjects or for genre, but for the sole love of his art. He painted everything, never restricted himself to any fixed programme, and never became trivial. He is perhaps in Germany the only painter of female portraits who has caught in his pictures a little of the charm that betrays itself in the expression and movements of the modern woman. In the works of Freiherr von Habermann (b. 1849) this refinement of sentiment, as expressed in colour, is combined with a still more decided shade of eccentricity. Already in his "Child of Sorrow," which hangs in the National Gallery at Berlin, he struck that painful chord that always remained his favourite. However different the subjects he has painted, a morbid note pervades them all.

In Heinrich Zügel (b. 1850), the Munich school possesses an animal painter who rivals the great Frenchmen in original power. Ludwig Dill (b. 1848), whom one must still count as "Dachauer," in spite of his migration to Carlsruhe, had for some time past been famous as a painter of Venice, the lagoons and Chioggia, when the impressionist movement became for him the starting-point of a new development. He strove for still brighter light,
tried to realize the most subtle shades of colour, and raised himself from a painter of natural impressions to free and poetical lyricism. Arthur Langhammer (b. 1855), Ludwig Herterich, Leo Samberger (b. 1851), Hans von Bartels (b. 1856), Wilhelm Kellers-Reutlinger (b. 1854), Beno Becker, Louis Corinth (b. 1858), Max Slevogt, are others that may be mentioned among the later Munich artists.

Fritz von Uhde (b. 1848) occupies a peculiar position as being the first to apply the principles of naturalism to religious art. Immediately before him, Eduard von Gebhardt (b. 1838) had gone back to the angular style of the old northern masters, that of Roger van der Weyden and Albert Dürer, believing he could draw the old Biblical events closer to present times by relating them in Luther's language and representing them as taking place in the most powerful epoch of German ecclesiastical history. Now that historical paintings had been dispossessed by modern and contemporary subjects, it followed also that scenes from the life of Christ had to be laid in modern times. "I do not assert that only the commonplace occurrences of everyday life can be painted. If the historical past be painted, it should be represented in human garb corresponding to the life we see about us, in the surroundings of our own country, peopleled with the people moving before our very eyes, just as if the drama had only been enacted the previous evening," Thus wrote Bastien-Lepage in 1879, when creating his "Jeanne d'Arc," and in this sense did Uhde paint. But besides the charm of feeling expressed in the subtlest hues, there is also the charm of the noble line.

At the time when, in England, Rossetti and Burne-Jones, and, in France, Puvis de Chavannes and Gustave Moreau, stepped into the foreground, in Germany Feuerbach (1829–1880), Marées (1837–1887), Thoma, (b. 1839), and Böcklin (1827–1901) were discovered. Feuerbach's life was one series of privations and disappointments. His "Banquet of Plato," "Song of Spring," "Iphigenia," and "Pietà," and the "Medea," the "Battle scene of the amacons," met with but scant recognition on their appearance. To some they appeared to lack sentiment, to others they were "not sufficiently German." When he died in Venice in 1880, he had become a stranger to his contemporaries. But posterity accorded him the laurel that his own age had denied him. Just those points in his pictures to which exception had been taken during his lifetime, the great solemn restfulness of his colouring and the calm dignity of his contours, made him appear contemporaneous.

Hans von Marées fulfilled a similar mission in the sphere of decorative art; his, likewise, was a talent that was not discovered until after his death. He is most in touch with Puvis de Chavannes. But the result was different. Puvis was recognized on his first appearance. Marées never had a chance of revealing his real strength. He was only 28 years of age when he first went to Rome; there in 1873, he was commissioned to paint some pictures for the walls of the Zoological Station at Naples. After that time, nothing more was heard of him until 1891, when four years after his death the works he had left behind him were exhibited and presented to the gallery of Schlesheim. The value of these works of art must not be sought in their technique. The art of Puvis rests on a firm realistic foundation, but Marées had finished his studies of nature too prematurely for the correctness of his drawing. In spite of this defect, they encourage as well as excite, owing to the principle which underlies them, and which they share in equal degree with those of Puvis. Like Puvis, Marées repudiated all illuminating efforts whereby forms might be brought into relief. He only retained what was intrinsically essential, the large lines in nature, as well as those of the human frame.

Next to these artists stands Hans Thoma, like one of the great masters of Dürer's time. In Marées and Feuerbach's works there is the solemn grandeur of the fresco; in those of Thoma that is nothing of Southern loveliness, but something of the homeliness of the old German art of woodcut; nay, something philistine, rustic, patriarchal—the simplicity of heart and childlike innocence that entrance us in German folklore, in the paintings of Moritz von Schwind (1804–1871) and Ludwig Richter (1803–1884). He had grown up at Bernau, a small village of the Black Forest. Blossoming fruit-trees and silver brooks, green meadows and solitary peasants' cottages, silent valleys and warm summer evenings, grazing cattle and the cackle of the farmyard, all lived in his memory when he went to Weimar to study the painter's art. This pious faithfulness to the home of his birth and touching affection for the scenes of his childhood pervade all his art and are its leading feature. Even when depicting classical subjects, the mythological marvels of the ocean and centaurs, Thoma still remains the simple-hearted German, who, like Cranach, conceives antiquity as a romantic fairy tale, as the legendary period of chivalry.

Whether it be correct to place Böcklin (q.v.) in the same category with these painters, or whether he has a right to a separate place, posterity may decide. The great art of the old masters has weighed heavily upon the development of that of our own age. Even the idealists, who have been mentioned, trace their pedigree back to the old masters. However modern in conception, they are to all intents and purposes "old" as regards the form they employed to express their modern ideas. Böcklin has no ancestor in the history of art; no stroke of his brush reminds us of a leader. No one can think of tracing him back to the Academy of Düsseldorf, to Lessing, or Schorner, as his first teacher. Even less can he be called an imitator of the old masters. His works are the result of nature in her different aspects; they have not their origin in literary or historical suggestion. The catalogue of his conceptions, of landscape in varying moods, is inexhaustible. But landscape does not suffice to express his resources. Knights on the quest for adventure, Saracens storming flaming citadels, Tritons chasing the daughters of Neptune in the billowy waves; such were the subjects which appealed to him. He endowed all fanciful subjects, all the art of the Middle Ages, the Middle Ages, the trees, sometimes rocks, or that move and have their being in the slimmest bottom of the sea, with body and soul, and placed a second world at the side of the world of actuality. Yet this universe of phantasy was too narrow for the master mind. If it be asked who created on the continent of Europe the most fervid religious paintings of the 19th century; who alone exhausted the entire scale of sensations, from the placidity of repose to the sublimity of heroism, from the gayest laughter to tragedy; who possessed the most solemn and most serious language of form and, at the same time, the greatest poetry of colour—the name of Böcklin will most probably form the answer.

These masters were for their younger brethren the pioneers into a new world of art. It was momentous for the painter's art that in Germany, no less than in England and France, a new movement at this time set in—the so-called "arts and crafts." Hitherto the various branches of art had followed separate courses. The most beautiful and artistic works were often hung in surroundings grievously lacking in taste. Now arose the ambition to make the room itself a work of art. The picture, as such, now no more stands in the foreground, but the different arts strive together to form a single piece of art. The picture is regarded as merely a decorative accessory.

Among the younger painters still to be mentioned, Max Klinger (b. 1857) is perhaps the most brilliant. He had begun with the etching-needle, and by its aid gave us entire novels, crisp little dramas of everyday life. But this realism was only a preliminary phase enabling him to pass on to a great independent art of form. His great picture, "Christ in Olympus," combines beauty of form with deep philosophical meaning. Ibsen in 1875, in his Emperor and Galilean, talked of a "third realm," combining heathen beauty with Christian profundity. Klinger's "Christ in Olympus" strikes the beholder as the realization of this idea. Stuck (b. 1869) shares with him the Hellenic serenity of form, the classical simplicity. Apart from this, his pictures are thoroughly different. It might almost be said "Klinger is the Nazarene who stepped into Olympus"; the thoughtful, deep son of the North who carries profound physical
problems into the beauty-loving Hellenic worship of the senses. Stuck's art is, also, almost classical in its insensibility and modified coldness. In his first picture (1880) "The Guardian of Paradise" he painted a slim wiry angel, who, like Donatello's "St George," in calm confidence and self-assurance points the sword before him. And similar rigid figures standing erect in steadiness—always portraits of himself—recur again and again in his works. Even his religious pictures—the "Pietà" and "The Crucifixion"—are, in reality, antique. One would seek in vain for them in the piety of the old masters or the Germanic fervour of Udeh. Grand in style and line, firm, solemn, serious in arrangement, they are yet hard and cold in conception.

Ludwig von Hoffmann (b. 1861) stands next to him, a gentle, dreamy German. In Stuck's work everything is strong and rugged; here all is soft and round. There the massiveness of sculpture and stiff heraldic lines: here all dissolved into variegated fairy tales, glowing harmonies. However classical he may appear, yet it is only the old yearning of the German for Hesperia—the song of Mignon—that rings throughout his works; the longing to emerge from the mist and the fog into the light, from the humdrum of everyday life into the remote fabulous world of fairydom, the longing to escape from sin and attain perfect innocence.

There are numerous others deserving of mention besides those already discussed. Josef Sattler (d. 1867), Melchior Lechter (b. 1871), and Otto Greiner (b. 1860), and likewise those who, such as Von Berlepsch (b. 1882) and Otto Eckmann (b. 1865), devoted their energies again to "applied art."

AUSTRIA-HUNGARY

In Austria the influence of Makart (1840-1884) was predominant in the school of painting during the last quarter of the 19th century. He personified the classical expression of an epoch, when a long period of colour-blindness was followed by an intoxication of colour. Whilst Piloty's ambition stopped short at the presentation of correct historical pictures, his pupil, Makart, felt himself a real painter. He does not interpret either deep thought or historical events, nor does he group his pictures together to suit the views of the art student. His work is essentially that of a colourist. Whatever his subject may be, whether he depicts "The Plague in Florence," "The Nuptials of Caterina Cornaro," "The Triumphal Entry of Charles V.," "The Bank of Cleopatra," or "The Five Senses," "The Chase of Diana," or "The Chase of the Amazons," his pictures are romances of brilliant dresses and human flesh. A few studies of the nude and sketches of colour, in which he merely touched the notes that were to be combined into chords, were the sole preliminaries he required for his historical paintings. Draperies, jewels, and voluptuous female forms, flowers, fruit, fishes and marbles—everything that is full of life and sensuous emotion, and shines and glitters, he heaps together into gorgeous still-life. And because by this picturesque sensuousness he restored to Austrian art a long-lost national peculiarity, his appearance on the scene was as epoch-making as if some strong power had shifted the centre of gravity of all current views and ideas.

In estimating Makart, however, we must not dwell on his pictures alone. He did more than merely paint—he lived them. Almost prematurely he dreamed the beautiful dream which in later days came nearer realization, that no art could exist apart from life—that life itself must be made an art. His studio, not without reason, was called his most beautiful work of art. Whithersoever his travels led him—to Granada, Algiers, or Cairo—he made extensive purchases, and refreshed his eye with the luscious splendour of rich silks and the soft lustrous hues of velvets. He made collections of carved ivory and Egyptian mummies, Gobelins, armour and weapons, old chests, antique sculpture, golden brocades with glittering embroideries, encrusted coperelts and the precious textures of the East, columns, pictures, trophies of all ages and all climes. He scattered money broadcast in striving to realize his dream of beauty, to pass on to the world, such a world as Rubens, so bright in colour, so princely in splendour.

Uniting as he did these artistic qualities in his own person—not only because he was a painter, but because in no other besides did the great yearning for aesthetic culture find such powerful utterance—Makart exercised an influence in Austria far transcending the actual sphere of the painter's art. An intense fascination went forth from the little man with the black beard and penetrating glance. At that time Makart dominated not merely Viennese art, but likewise the whole cultured life of the capital. Not only the Makart hat and the Makart bouquet made their pilgrimage through the world, he became also the motive power in all intellectual spheres. When Charlotte Wolter acted Cleopatra or Messalina on the stage, she not only wore dresses specially patched for her by Makart, but she also spoke in Makart's style, just as Hamerling wrote in it. A veritable Makart fever had, indeed, taken possession of Vienna. No other painter of the 19th century was so popular, the life of none other was surrounded by such princely sumptuousness. The scene when, during the festivals of 1879, he headed the procession of artists past the imperial box, mounted on a white steed glittering with gold, the Rubens hat with white feathers on his head, amidst the boisterous acclamations of the populace, is unique in the modern history of art. It is the greatest homage that a Philistine century ever offered an artist.

The life of August von Pettenkofen (1821-1889), who, after Makart, was accounted the greatest Austrian painter of the last quarter of the 19th century, was passed much more modestly and serenely. He had grown up on one of his father's estates in Galicia, and had been a cavalry officer before becoming a painter. His place in Austria is that of Menzel in Germany. With Pettenkofen a new style appeared. The representation of modern subjects now began to take the place of historical painting, which had for so long a time been the ruling taste; not in the sense of the old-fashioned genre pictures in that of artistic refined painting. Here, again, the distinctive Austrian note can be easily recognized. Pettenkofen's people are lazy, and yawn. All is contemplative and peaceful, full of dreamy, sleepy repose.

But neither Pettenkofen nor Makart has found followers. The great movement which, originating with Manet, took place in other centres of art, passed Austria by without leaving a trace. Hans Canon (b. 1829), who in his pictures transported the characters of the "Gründerzeit" to Venice of bygone days, and reproduced them as Venetian nobles and ladies of quality, is also a painter of note. So likewise is Rudolf Alt (b. 1812), still active with the brush in 1902, a refined painter in watercolours, who reproduces the beauties of Old Vienna in his subtle architectural sketches. Leopold Karl Müller (1834-1892), who had lived in Cairo with Makart, found his sphere of art in the variegated world of the Nile, and his ethnographical exactitude combined with his delicate colouring. Made him for a long while much in request as a painter of Oriental scenes, and a popular illustrator of Egyptianological works. Emil Schindler was a great landscape painter, who often rose from this faithful interpretation of nature to an almost heroic height. Heinrich von Angeli (b. 1840), again, furnished—as he continued to do—the European courts with his representative pictures, combining refined conception with smooth elegant technique. These are the only artists who during the 'eighties rose above local mediocrity. After Makart died in 1884, the sun of Austrian art seemed to have set. Stagnation reigned supreme.

Only since the "Secession" from the old Society of Artists (Künstlergenossenschaft), which took place in 1896, has the former artistic life recommenced in Vienna. Theodor von Herrmann, long domiciled in Paris, was the gifted initiator of the new movement, and succeeded in rousing a storm of discontent among the rising school of Viennese artists. They found a literary champion in their hero's father, who pleaded in eloquent language for a new Austrian culture. In November 1898 the
Sectionists opened their first exhibition in a building erected by Josef Olbrück on the Wienerzell. At first the importance of these exhibitions lay almost exclusively in the fact that the Viennese were thus given an opportunity of making acquaintance with the famous foreign masters. Puvis de Chavannes, Segantini, Besnard, Brangwyn, Meunier, Kohnoff, Henri Martin, Vischer, who had until then been practically unknown in Austria, so that the public only then realized the inferiority of their countrymen's artistic work. Thus while acquainting the Viennese public with the strivings of European art, the Section endeavoured at the same time to produce, in rivalry with foreigners, works of equal artistic merit. Leading foreign masters now joined the movement, and Vienna, which had so long stood aside, through inability to be represented worthily at international exhibitions, became once more a factor in contemporary European art.

Among the painters of the Section, Gustav Klint possesses, perhaps, the most powerful original talent. Refined portraits, subtle landscapes and decorative pictures, painted for the Tumba Palace and for the Vienna Hof Museum, first brought his name before the world. But he became famous in consequence of the controversy which arose around his picture "Philosophy." He had been commissioned to paint the large ceiling piece for the "aula" of the Vienna University, and instead of selecting a classical subject he essayed an independent work. The heavens open; golden and silvery stars twinkle; sparks of light gleam; masses of green cloud and vapour form clusters; naked human forms float about; a fiery head, crowned with laurel, gazes on the scene with large, serious eyes. Science climbs down to the sources of Truth: yet Truth always remains the inscrutable Sphinx. Klint paid the penalty of his bold originality by his work remaining dark and incomprehensible to most people. It has, notwithstanding, an historical importance for Austria corresponding to that which similar works of Besnard have for France. It embodies the first attempt to place monumental painting upon a purely colouristic basis, and to portray allegorical subjects as pure visions of colour. After Klint, Josef Engelhart (b. 1864) is deserving of notice. He is the true painter of Viennese life. On his first appearance his art was centred in his native place, and was strong in local colour, which was lacking in refinement. To acquire subtlety, he studied the great foreign masters and became a clever juggler with the brush, showing as much dexterity as any of them. Yet this virtuosity meant, in his case, only a good schooling, which should enable him to return with improved means to those subjects best suited to his talent. His works are artistic, but at the same time they are distinctly local.

Carl Moll (b. 1861) understands how to render with equal skill the play of light in a room and that of the sunbeams upon the fresh green grass. The rural pictures of Rist produce a fresh, cool and sunny effect upon the eye; like a refreshing draught from a cool mountain spring—a piece of Norway on Austrian soil. Zettel's landscapes are almost too markedly Swiss in colour and conception. Julius von Goldmann worked a long time in Paris and London, and acquired, in intercourse with the great foreign painters—notably Carrière and Watts—an exquisitely refined taste, an almost hyperaesthetic sense for discreetly toned-down colour and for the music of the line. In Friedrich König, M. von Schwind's romantic vein is revived. Even the simplest scenes from nature appear under his hand as enchanted groves whispering secrets. Everything is true and, at the same time, dreamy and mysterious. The mythical beauty of the German legends—dragon and enchanted princesses—peep through the forest thicket. Ernst Nowak (b. 1851), compared with him, is a sturdy painter, who knows his business well. He sings no delicate lyric. When one stands close by, his pictures appear like masonic—like reliefs. Seen from a distance, the blotsches of colour unite into large powerful forms. Bernatzik understands how to interpret with great subtlety twilight moods—moonshine struggling with the light of street lamps, or with the dawn. Ticky followed Henri Martin in painting solemn forest pictures. Ferdinand André leants towards the austere power of Millet. He tells us in his work of labour in the fields, of bronzed faces and hands callous with toil, and especially must his charcoal drawings be mentioned, in which the colour overlays the forms like light vapour, and which, small as they are, have a sculptural effect. Auchterelte—known for his female studies—and Hänisch and Otto Friedrich (b. 1862), refined and subtle as landscape painters, must also be mentioned.

In rivalry with the Section, the "Künstlergenossenschaft" has taken a fresh upward flight. Among figure painters, Delug, Goltz (b. 1857), Hirschl and Veith are conspicuous; but still greater fascination is exercised by landscape painters such as Ameszadon, Charlemon, &c., whose works show Austrian art in its most amiable aspect. Apart from Austrians proper, there are also representatives of the other nationalities which compose the monarch of many tongues.' Bohemia takes the lead with a celebrity of European reputation—Gabriel Max (b. 1840), who, although of Piloty's school and residing in Munich, never repudiated his Bohemian origin. The days of his youth were passed in Prague; and Prague, the medieval, with its narrow winding alleys, is the most mysterious of all Austrian cities, enveloped in the breadth of old memories and bygone legends. From this soil Max drew the mysterious fragrance that characterizes his pictures. His earliest work, the "Female Martyr on the Cross" (1867), struck that sweetly painful, half-tormenting, half-enchanting keynote that has since remained distinctively his. Commenotypbe historical painting received at Max's hands an entirely new nuance. The morbidity of the mortuary and the lunatic asylum, interspersed with spectres—something pervers, unnatural and heartrending—this is the true note of his art. His martyrs are never men—only delicate girls and helpless women. His colouring corresponds to his subjects. The sensations his pictures produce are akin to those which the sight of a beautiful girl lying in a mortuary, or the prison scene in Faust enacted in real life, might be expected to excite. He even applies the results of hypnotism and spiritualism to Biblical characters. In many of his pictures refinement in the selection of effects is missing. By over-production Max has himself vulgarized his art. Yet, despite his manner of depicting the mysteries of the realms of shadows, and the intrusion of the spirit-world into realism, he remains a modern master. A new province—the spectral—was opened up by him to art.

Hans Schwaiger is the real raconteur of Bohemian legends. He, likewise, passed his youth in a small Bohemian village, over which old memories still brooded. In Hradec, places upon which the galleries had stamped their influence the solemn corridors and passages of the ruined castle were haunted by the shades of its old possessors. This is the mood that led Schwaiger to legend-painting. But underlying his fairy tales there are the gallows or the alchemy of Faust. The landscape with its gloomy skies, the wooden huts, turrets, dwarfed trees—such are ever the accompaniments of his figures.

Of the younger generation of painters, Emil Orlick (b. 1870) seems to be the most versatile. Having acquired technique in Paris and Munich, he practically discovered Old Prague to the world of art. The dark little alleys of the ancient town, swarming with life compressed within their narrow compass, fascinated him. In order to retain and convey all the impressions that crowded in upon him in such superabundant plenitude, he learned how to use the knife of the wood-carver, the needle of the stitcher, and the pen of the hieroglyphist. He resembles the workshop of a printer than the atelier of a painter. In the field of lithography he has attained remarkable results. Orlick has also made his own everything that can be learned from the Japanese. Besides these masters, Albert Hynais, the creator of decorative pictures almost Parisian in conception, must be mentioned. The landscape painters Wickener, Jansa, Slavicek, and Hudecek relate, in gentle melancholy tones of colour, the atmosphere and solitude of the wide plains of Bohemia.

In Poland, painting has its home at Cracow. Down to the year 1893 Johann Matejko was living there, in the capacity
of director of the Academy. His pictures are remarkable for their originality and almost brutal force, and differ very widely from the conventional productions of historical painters. At the close of the 19th century Axentowicz, Olga Hojanska, Mehoffer, Stanislawski and Wytkowski attracted attention. Although apparently laying much less stress on their Polish nationality than their Russian countrymen, their works proclaim the soul of the Polish nation, with its chivalrous gallantry and mute resigned grief, in a much purer form.

Hungary in the spring of 1900 lost him whom it revered as the greatest of its painters—Michael Munkacsy. Long before his death his brush had become idle. To the younger generation, which seeks different aims, his name has become almost synonymous with a wrongly-conceived old-masterly coloration, and with sensation painting and hollowness. "The Last Day of the Condemned Prisoner," his first youthful picture, contained the programme of his art. Then came "The Last Moments of Mozart," and "Milton dictating Paradise Lost." These titles summon up before our eyes a period of all that is false in ecletic art, dominated by Delaroche and Ploty. Even the simplest defects of the latter are imitated by Munkacsy in Ploty's misterious style. "Christ before Pilate," "Ecce Homo," "The Crucifixion"—all these are gala representations, costume get-up, and, to that extent, a lie. But when we condemn the faults of his period, his personal merit must not be forgotten. When he first came to the fore, ostentation of feeling was the fashion. Munkacsy is, in this respect, the genuine son of the period. He was not one of those who are strong enough to swim against the stream. Instead of raising others to his level, he descended to theirs. But he has the merit of having painted spectacular scenes, such as the period demanded, with genuine artistic power. Like Rahl, Ribot, Roybet and Makart, he was a maître-peintre, a born genius with the brush. Von Uhde and Liebermann were disciples of his school. And if these two painters have left that period behind them, and if independent natural sight has followed upon the imitation of the old masters, it is Munkacsy who enabled them to take the leap.

(R. Mz.)

ITALY

Modern Italy has produced one artist who towers over all the others, Giovanni Segantini (q.e.) Segantini owes as little to his period of study in Milan as Millet did to his sojourn at Delaroche's school. Both derived from their teachers a complete mastery of technique, and as soon as they were in possession of all the aids to art, they discarded them in order to begin afresh. Each painted what he had painted as a youth. They dwelt far from the busy world—Millet in Barbizon, Segantini at Val d'Albola, 5000 feet above the sea-level. They are equally closely allied in art. Millet, who rejected all the artifice of embellishment and perceived only beauty in things as they are, learned to see in the human body a heroic grandeur, in the movements of peasants a majestic rhythm, which none before him had discovered. Although representing peasants, his works resemble sacred pictures, so grand and majestic are their sublime solemn simplicity. The Anglo-Saxon peculiarity of Segantini's works like Millet, he found his vocation in observing the life of poor, humble people, and the rough grandeur of nature, at all seasons and all hours. As there is in Millet's, so also is there in Segan-
tini's work a primitive, almost classical, simplicity of execution corresponding to the simplicity of the subjects treated. His pictures, with their cold silvery colouring, remind us of the wax-painting of old times and of the mosaic style of the middle ages. They are made up of small scintillating strokes; they are stony and look hard like steel. This technique alone, which touches in principle but not in effect, that of the pointillistes, permitted of his rendering what he wished to render, the stony crags of Alpine scenery, the thin scintillating air, the firm steel-like outlines. Finally, he passed from realistic subjects to thoughtful, Biblical and symbolical works. His "Anunciation," the "Divine Youth," and the "Massacre of the Innocents" were products of an art that had abandoned the firm ground of naturalism and aimed at conquering supernatural worlds. This new aim he was unable to realize. He left the "Panorama of the Engadine," intended for the Paris Exhibition, in an unfinished state behind him. He died in his 42nd year, his head full of plans for the future. Modern Italy lost in him its greatest artist, and the history of art one of the rare geniuses.

Few words will suffice for the other Italian painters. The soil that had yielded down to Tiepolo's days such an abundant harvest was apparently in need of rest during the 19th century. At the Paris Exhibition of 1867 About called Italy "the tomb of art," and indeed until quite recent times Italian painting has had the character of mere prettily saleable goods. Francesco Vinea, Tito Conti, and Federigo Andreotti painted with tireless activity sleek drapery pictures, with Renaissance lords and smiling Renaissance ladies in them. Apart from such subjects, the comic, genre or anecdote ruled the fashion—somewhat coarse in colour and of a merrier tendency than is suitable for pictures of good taste. It was not until nearly the end of the 19th century that there was an increase in the number of convictions to this achievement. At the Paris Exhibition of 1900 only Detti's "Chest" and Signorini's "Cardinal" pictures reminded one of the comedy subjects formerly in vogue. The younger masters employ neither "drapery-mummeries" nor spacy anecdotes. They paint the Italian country people with refined artistic discernment, though scarcely with the naturalism of northern nations. Apparently the calm, serious, ascetic, austere art initiated by Millet is foreign to the nature of this volatile, colour-loving people. Southern fire and delight in brilliant hues are especially characteristic of the Neapolitans. A tangle of baldachinos, priests and choir boys, peasants making obeisance and kneeling during the passing of the Host, weddings, horse-races and country festivals, everything sparkling with colour and glowing in Neapolitan sunlight—such are the contents of Paolo Michetti's, Vincenzo Capri's, and Edouardo Dalbono's pictures. But Michetti, from being an adherent of this glittering art, has found his way to the monumental style. The Venetians acknowledge and honour as their leader Giacomo Favretto, who died very young. He painted drapery pictures, like most artists of the 'eighties, but they were never lackadaisical, never commonplace. The Venice of Canaletto and Goldoni, the magic city surrounded by the glamour of bygone splendour, rose again under Favretto's hands to fairylike radiance.

The older masters, Signorini, Tito Tommasi, Dall'oca Branca, who depict the Piedmontese landscape, the light on the lagoons, and the colour charm of Venetian streets with so refined a touch, have numerous followers, whose pictures likewise testify to the seriousness that again took possession of Italian painters after a long period of purely commercial artistic industry. Side by side with these native Italians two others must be mentioned, who occupy an important place as interpreters of Parisian elegance and French art-history. Giuseppe de Nittis (born in Naples; died in Paris 1884) was principally known by his portraits of the French courtiers, but his figures, the enlivened his pictures were as full of charm as his rendering of atmospheric effects was refined. Giovanni Boldini, a Ferrarese living in Paris, also painted street scenes, full of throbbing life. But he excelled, besides, as a portrait-painter of ladies and children. He realized the aim of the Parisian Impressionists, which was to render life, and not merely mute repose. He understood in a masterly fashion how to catch the rapid movement of the head, the fleeting expression, the sparkling of the eye, a pretty gesture. From his pictures posterity will learn as much about the sensuous life of the 19th century as Greuze has told us about that of the 18th.

Among those who have been the leaders of modern Italian art, not already mentioned, are Domenico Morelli, Giovanni Costa, landscape painter; Sartorio, an Italian Pre-Raphaelite; Pasini, painter of the East; Muzzioli, a follower of Alma- Tadema; Barbino, historical painter; and most striking and original of all, Monticelli, whose glow of colours was often
obtained, not only by palette-knife painting, but by squeeving the colour straight from the tubes to the canvas.

See Ashton R. Willard, History of Modern Italian Art (London, 1898).

SPAN AND PORTUGAL

Modern Spanish painting began with Mariano Fortuny (q.v.), who, dying as long ago as 1874, nevertheless left his mark even on the following generation of artists. During his residence in Paris in 1866 he had been strongly influenced by Meissonier, and subsequently selected similar subjects—scenes in 18th-century costume. In Fortuny, however, the French painter’s elaborate finish is associated with something more intense and vivid, indicative of the southern Latin temperament. He collected in his studio in Rome the most artistic examples of medieval industry. The objects among which he lived he also painted with incisive spirit as a setting for elegant figures from the world of Watteau and of Goya, which are thrown into his pictures with amazing dash and sparkle; and this love of dazzling kaleidoscopic variety has animated his successors. Academic teaching tries to encourage historical painting. Hence, since the seventies, the chief paintings produced in Spain have been huge historical works, which have made the round of European exhibitions and then been collected in the Gallery of Modern Art at Madrid. There may be seen “The Mad Queen Juana,” by Pradilla; “The Conversion of the Duke of Gandía,” by Moreno Carbonero; “The Bell of Huesca,” by Casado; “The Last Day of Numantia,” by Vera; “Tres de Castro,” by Cabello.

It is possible, of course, to discern in the love of the horrible displayed in these pictures an element of the national character, for in the land of bull-fights even painting turns to murder and sudden death, poison and the rope. However, at least we must admit the great power revealed, and recognize the audacious colouring. But in point of fact these works are only variants on those executed in France from the time of Delaroche to Jean Paul Laurens, and tell their story in the style that was current in Parisian studios in the sixties. What is called the national garb of Spain is mainly the cast-off fashion of Paris. After all this magnificent work Fortuny’s rococo became the rage. The same painters who had produced the great historical pictures were now content to take up a brilliant and dazzling miniature style; either, like Fortuny himself, using small and monkey figures in baroque subjects, or adapting the most national life of Spain to the rococo style.

Here again we observe the acrobatic dexterity with which the painters, Pradilla especially, use the brush. But here again there is nothing essentially new—only a repetition of what Fortuny had already done twenty years before. The Spanish school, therefore, presented a very old-fashioned aspect at the Paris Exhibition of 1900. The pictures shown there were mostly wild or emotional. Bedouins fighting, an antique quadriga flying past, the inhabitants of Pompeii hastily endeavouring to escape from the lava torrent, Don Quixote’s Rosinante hanging to the sail of the windmill, and the terrors of the Day of Judgment were the subjects; Alvarez Dumont, Benlliure y Gil, Úlpiano Checa, Manuel Ramirez Ibáñez and Moreno Carbonero were the painters. Among the huge canvases, a number of small pictures, things of no importance, were scattered, which showed only a genre-like wit. Spain is a somewhat barren land in modern art. There painting, so active, is blind to life and to the treasures of art which lie unheeded in the region. Only one artist, Agrasot, during the seventies painted pictures of Spanish low life of great sincerity; and much later two young painters appeared who energetically threw themselves into the modern movement. One was Sorolla y Bastida, by whom there is a large fishing picture in the Luxembourg, which in its stern gravity might be the work of a Northern painter; the other was Ignacio Zuloaga, in whom Goya seems to live again. Old women, girls of the people, and cocottes especially, he has painted with admirable spirit and with breadth. Spain, which has taken so little part in the great movement since Manet’s time, only repeating in old-fashioned guise things which are falsely regarded as national, seems at last to possess in Zuloaga an artist at once modern and genuinely national.

Portugal took an almost lower place in the Paris Exhibition. For whereas the historical Spanish school has endeavoured to be modern to some extent, at least in colour, the Portuguese cling to the blue-plush and red-velvet splendours of Delaroche in all their cruelty. Weak pictures of monks and of visions are produced in numbers, together with genre pictures depicting the popular life of Portugal, spiced to the taste of the tourist. There are the younger men who aim at availing themselves of the efforts of the open-air painters; but even as followers of the Parisians they only say now what the French were saying long years ago through Bastien-Lepage, Puvis de Chavannes and Adrien Dumont. There is always a Frenchman behind the Portuguese, who guides his brush and sets his model. The only painter formed in the school is Carlos Reis, whose vast canvas “Sunset” has much in common with the first huge peasant pictures painted in Germany by Count Kalckreuth. One painter there is, however, who is quite independent and wholly Portuguese, a worthy successor of the great old masters of his native land, and this is Columbano, through whose hands the elements of the genius which inspired the works of Velazquez and Goya.

DENMARK

Denmark resembles Holland in this: that in both, nature presents little luxury of emphasized colour or accentuated majesty of form. Broad flats are everywhere to be seen—vague, almost indefinable, in outline. Danish art is as demure and staid as the Danish landscape. As in Holland, the painters make no bold experiments, attempt no pretentious subjects, no rich colouring, nothing sportive or light. Like the Dutch, the Danes are somewhat sluggish and tranquil, loving dim twilight and the swirled mist. But Denmark is a leaner land than Holland, less moist and more thinly inhabited, so that its art lacks the comfortable self-satisfied character of Dutch art. It betrays rather a tremulous longing, a pleasing melancholy and delight in dreams, a trembling dread of contact with coarse and stern reality. It was only for a time, early in the seventies, that a touch of cosmopolitanism affected Danish art. The phase of grandiose historical painting and anecdotic genre was experienced there, as in every other country. In Karl Bloch (b. 1834), Denmark had a historical painter in some respects parallel with the German Piloty; in Axel Helsted (b. 1847), a genre painter reminding us of Ludwig Knaus. The two artists Laurits Tuxen (b. 1853) and Peter Kröyer (b. 1851), who are most nearly allied to Manet and Bastien-Lepage, have a sort of elegance that is almost Parisian. Kröyer, especially, has bold inventiveness and amazing skill. Open-air effects and twilight moods, the glare of sunshine and artificial light, he has painted with equal mastery. In portraiture, too, he stands alone. The two large pictures in which he recorded a “Meeting of the Committee of the Copenhagen Exhibition, 1887,” and a “Meeting of the Copenhagen Academy of Sciences,” are modern works which in power of expression may almost compare with those of Frans Hals. Such versatility and facile elegance are to be found in no other Danish painter. At the period of historic painting it was significant that next to Bloch, in Copenhagan, came Kristian Zahrtmann (b. 1854), who painted scenes from the life of Eleonora Christina, a Danish heroine (daughter of Christian IV.), with the utmost simplicity, and without any emotional or theatrical paths. This touching feeling for home and country is the keynote of Danish art. The Dane has now no sentiment but that of home; his country, once so powerful, has become but a small one, and has lost its political importance. Hence he clings to the little that is left to him with melancholy tenderness. Viggo Johansen (b. 1851), with his gentle dreaminess, is the best representative of modern Danish home-life. He shows us dark sitting-rooms, where a quiet party has met around the tea-table. “An Evening at Home,” “The Christmas Tree,” “Grandmother’s Birthday,” are typical subjects, and all have the same fresh and fragrant
PAINTING

(SWEDEN: NORWAY)

We enter a new world when in picture-galleries we pass to the Norwegian from the Swedish section. From the great city we are transported to nature, solemn and solitary, into a land of silence, where a rude, sparse population, a race of fishermen, snatches a scanty sustenance from the sea. The Norwegians also contributed for a time to the international market in works of art. They sent mainly genre pictures telling of the manners and customs of their country, or landscapes depicting the phenomena of Northern scenery. Adolf Tidemand (1814-1876) introduced his countrymen—the peasants and fishermen of the Northern coast—to the European public. We are introduced to Norwegian Christmas customs, accompany the Norseman on his nocturnal fishing expeditions, join the "Brudefaerd" across the Hardanger fjord, sit as disciples at the feet of the Norwegian sacristan. Ferdinand Fagerlin (b. 1825) and Hans Dahl are two other painters who, educated at Düsseldorf and settled in Germany, introduced the style of Knaus and Vautier to Norwegian art circles. Knud Babbe (1808-1879), Hans Gude (b. 1829), Niels Björnsen Møller, Morten-Müller (b. 1828), Ludvig Munthe (1824-1860), and Adelsten Normann (b. 1848) are known as excellent landscape painters, who have faithfully portrayed the majestic mountain scenery and black pine forests of their native land, the cliffs that enclose the fjords, and the sparkling snowfields of the land of the midnight sun. But the time when actuality had to be well seasoned, and every picture was bound to have a spice of genre or the attraction of something new to common to make it palatable, is past and gone. As early as the 'sixties Bjørnson was president of a Norwegian society which made it its chief business to wage war against the shallow conventionalities of the Düsseldorf school. Ibsen was vice-president. In the works of the more modern artists there is not a single trace of Düsseldorf influence. Especially in the 'eighties, when naturalism was at its zenith, we find the Norwegians its boldest devotees. They portrayed life as they found it, without embellishment; they did not trouble about plastic elegance, but painted the land of their home and its people in a direct, rough-hewn style. Like the people we meet in the North, giants with stalwart iron frames, callous hands, and sun-burnt faces, with their sou'-wester and blue bouses, who resemble sons of a bygone heroic age, have the painters themselves—notably Niels Gustav Wentzel (b. 1859), Svend Jørgensen (b. 1861), Kolsete (b. 1860), Christian Krogh—something primitive in the directness, in, one might almost say, the barbarous brutality with which they approach their subjects. They preferred the most glaring effects of plein-air; they revelled in all the hues of the rainbow.

But these very uncouth fellows, who treated the figures in their pictures with such rough directness, painted even in those
days landscapes with great refinement; not the midnight sun and the precipitous cliffs of the fjords, by which foreigners were wont to be impressed, but austere, simple nature, as it lies unrelieved by the keel of any boat, where no human being is visible, where no sound is audible; the hour of twilight, when the sun has disappeared behind the mountains, and all is chill and drear; the winter, when an icy blast sweeps over the crisp snow-fields; the spring, almost like winter, with its bare branches and its thin young shoots. Such were their themes, and painters like Amaldus Nilsen (b. 1838), Eilif Petersen (b. 1852), Christian Skredsvig (b. 1854), Fritz Thaulow (b. 1848), and Gerhard Munthe (b. 1849) arrested public attention by their exhibition of pictures of this character.

Latterly these painters have become more civilized, and have emancipated themselves from their early uncoutness. Jörgensen, Krogh, Kolstoe, Soot, Gustav Wentzel, no longer paint those herculean sailors and fishermen, those pictures of giants that formerly gave to Norwegian exhibitions their peculiar character. Elegance has taken possession of the Norwegian school. The most noted of late is Christian Munthe, who, among others, with Fritz Thaulow, and indeed his art threatened to resolve somewhat into routine, and even the ripples of his waters to sparkle somewhat coquetishly. Borgen (b. 1852), Hennig (b. 1871), Hjelread (b. 1863), and Stenersen (b. 1862) were invited recruits of the ranks of Norwegian painters, whilst Halfdan Strom (b. 1863), who depicts rays of light issuing from silent windows and streaming and quivering over solitary landscapes, dark blue streams and ponds, nocturnal skies, variegated female dresses, contrasting as spots of colour with dark green meadows, has a delicacy in colouring that recalls Cazin. Gerhard Munthe, who, as we have seen, first made a name by his delicate vernal scenery, has turned his attention to the classical side of art; and, finally Erik Wernersfelt (b. 1853), who was also first known by his landscapes and scenes of country life, afterwards gained success as an illustrator of Norwegian folk-lore. (R. M.)

RUSSIA

Until late in the 19th century modern Russian painting was unknown to western Europe. What had been seen in international exhibitions showed the traditions of primitive European art, and the generation between the 1830s and 1850s were less bent on art than on political agitation; they used the brush as a means of propaganda in favour of some political idea. Peroff showed us the miserable condition of the serfs, the wastefulness and profligacy of the nobility. Verschagin made himself the advocate of the soldier, painting the horrors of war long before the tsar's manifesto preached universal disarmament. Art suffered from this praiseworthy misapplication; many pictures were painted, but very few rose to the level of modern achievement in point of technique. It was only by the St Petersburg art journal Mir Iskusstwa, and by a small exhibition arranged at Munich in 1892 by a group of Russian landscape painters, that it was realized that a younger Russian school had arisen, fully equipped with the methods of modern technique, and depicting Russian life with the stamp of individuality. At the Paris Exhibition of 1900 the productions of this young Russian school were seen with surprise. A florescence began, to which literature displayed in Pushkin's Faust, Dostoevsky and Tolstoy seemed to be beginning for Russian painting. Some of these young painters rushed into art with unbridled zest, painting with primitive force and boldness. They produced historical pictures, almost barbaric but of striking force; representations of the life of the people full of deep and hopeless gloom; the poor driven by the police and huddled together in dull indifference; the popes tramping across the lonely steps, prayer-book in hand; peasants muttering prayers before a crucifix. There is great pathos in "The Karamasow Brothers," or "The Power of Darkness." At the same time we feel that a long-inherited tradition pervades all Russia. We find a characteristic ecclesiastical art, far removed from the productions of the fin de siècle, in which the rigid tradition of the Byzantines of the 3rd century still survives.

And, finally, there are landscapes almost Danish in their bloodless, dreamy tenderness. Among the historical painters Elias Repin is the most impressive. In his pictures, "Ivan the Cossack," "The Cossacks' Reply to the Sultan," and "The Miracle of Saint Nicholas," may be seen what is so rare in historical painting—genuine purpose and style. Terror is rendered with Shakespearean power; the boldness with which he has reconstituted the past, and the power of pictorial psychology which has enabled him to give new life to his figures, are equally striking in "Sowing on the Volga" and "The Village Procession." He was the first to paint subjects of contemporary life, and the work, while thoroughly Russian, has high technical qualities—the sense of oppression, subjection and gloom is all-pervading. But he does not "point the moral," as Peroff did; he paints simply but sympathetically what he sees, and this lends his pictures something of the resigned melancholy of Russian songs. Even more impressive than Repin is Philippe Malavine. He had rendered peasants, stalwart figures of powerful build; and, in a picture called "Laughter," Macbeth-like women, wrapped in rags of fiery red, are thrown on the canvas with astonishing power. Among religious painters Victor Vasnetzov is the powerful decorator of the dome in the Church of St Vladimir at Kiev, the most distinguished figure. These paintings seem to have been executed in the very spirit of the Russian church; blazing with gold, they depend for much of their effect upon barbaric splendour. But Vasnetzov has painted other things: "The Scythians," fighting with lance and battle-axe; horsemen making their way through the pathless steppe; and woods and landscapes pervaded by romantic charm, the home of the spirits of Russian legend. Next to Vasnetzov is Michael Nesterov; a painter also of monks and saints, but as different from him as Zurbaran from the mosaic workers of Venice; and Valentin Serov, powerful in portraiture and fascinating in his landscape. It is to be remarked that although these artists are austere and unpolished in their figure-painting, they paint landscape with delicate refinement. Schischkin and Vassiliev were the first to paint their native land in all simplicity, and it is in landscape that Russian art at the present time still shows its most pleasing work. Savrasov depicts tender spring effects; Kuiidish light birch-copse full of quivering light; Sudkovskiy interprets the solemn majesty of the sea; Albert Benois paints in water-colour delicate Finnish scenery; Apollinaris Vasnetzov has recorded the dismal wastes of Siberia, its dark plains and endless primeval forest, with powerful simplicity.

A special province in Russian art must be assigned to the Poles. It is difficult indeed to share to the full the admiration felt in Warsaw for the Polish painters. It is there firmly believed that Poland has a school of its own, owing nothing to Russia, Austria or Germany; an art which embodies all the chivalry and all the suffering of that land. The accessories are Polish, and so are the characters. Jan Chelinski, Wojciech Gerson, Constantine Gorski, Apolonius Kendzierski, Joseph Ryszkievicz and Roman Szovinkich are the principal artists. We see in their pictures a great deal of fighting, a great deal of weeping; but what there is peculiar to the Poles in the expression or technique of their works is hard to discover.

Finland, on the other hand, is thoroughly modern. Belonging by descent to Sweden rather than to Russia, its painters' views of art also resemble those of the "Parisians of the North." They display no ungoverned power, but rather supple elegance. The play of light and the caprice of sunshine are rendered with much subtlety. Albert Edelfeldt is the most versatile artist of the group; Axel Gallen, at first naturalistic, developed into a decorative artist of fine style; Eero Jauernfelt charms with his airy studies and brilliant landscapes. Magnus Enckell, Pekka Halonen and Victor Vesterholm sustain the school with work remarkable for sober and tasteful feeling. (R. M.)

BALKAN STATES

Until quite recent times the Balkan States had no part at all in the history of art. But at the Paris Exhibition of 1900 it was noted with surprise that even in south-eastern Europe
there was a certain pulsation of new life. And there were also
signs that painting in the Balkans, which hitherto had appeared
only as a reflex of Paris and Munich art, would ere long assume
a definite national character. At this Exhibition Bulgaria
seems to be the most backward of all, its painters still represent-
ing the manners and customs of their country in the style of
the illustrated papers. Market-places are seen, where women
with golden chains, half-nude boys and Old Jews are moving
about; or cemeteries, with orthodox clergy praying and women
sobbing; military pageants, wine harvests and horse fairs, old
men performing the national dance, and topers jesting with
brown-eyed girls. Such are the subjects that Anton Mittoff,
Raymund Ulrich and Jaroslav Vesin paint. More original is
Mvkuicka. In his most important work he represented the late
princess of Bulgaria sitting on a throne, solemn and stately, in
the background mosaics rich in gild, tall slim lilies at her side.
In his other pictures he painted Biblical landscapes, battlefields
wrapt in sulphurous smoke, and old Rabbis—all with a certain
uncouth barbaric power. The Bulgarian painters have not as
yet arrived at the aesthetic phase. One of the best among them,
who paints delicate pale green landscapes, is Charalampi Lief;
and Nicholas Michailoff, at Munich, has executed pictures,
representing nymphs and satyrs with arrest attention by their delicate tone
and exquisite beautiful colouring.

Quite modern was the effect of the small Croatian-Slavonic
Gallery in the Exhibition. Looking at the pictures there, the
visitor might imagine himself on the banks of the Seine rather
than in the East. The French saying, "Faire des Whistler,
faire des Dagnan, faire des Carrière," is eminently applicable
to their work. Vlado Bukovak, Nicola Masic, Osks and Medovic
all paint very modern pictures, and in excellent taste, only it is
surprising to find upon them Croatian and not Parisian signatures.

Precisely the same judgment must be passed with regard to
Rumania. Most of the painters live in Paris or Munich, have
sought their inspiration at the feet of the advanced masters
there, and paint, as pupils of these masters, pictures just as
good in taste, just as cosmopolitan and equally devoid of char-
acter. Irène Deschly, a pupil of Carrière, illustrates the songs
of François Coppée; Veronza Gargouroumie is devoted to the pant-
symbolism of Dagnan-Bouveret. Nicolas Grant paints bright
landscapes, with apple trees, with their pink blossoms, like
Danaé. Nicholas Gropeano appears as the double of Aman-
Jean, with his female heads and pictures from fairy tales. Olga
Korouca studied under Puvis de Chavannes, and painted Cle-
patra quite in the tone of her master. A landscape by A. Segall
was the only work that appeared to be really Rumanian,
representing thatched huts.

Servia is in striking contrast to Rumania. No trace of modern
influence has penetrated to her. There historical painting,
such as was in vogue in France and Germany a generation ago,
is the order of the day. Risto Voucanovitch paints his scenes
from Servian history in brown; Paul Ivanovitch his in greyish
plein-air. But in spite of this pale painting, the latter's works
have no modern effect—as little as the sharply-drawn small
landscapes of his brother Svatislav Ivanovitch. (R. Mx.)

United States

The history of painting in the United States practically
began with the 19th century. The earlier years of the nation
were devoted to establishing government, subduing the land
and the aborigines, building a commonwealth out of primeval
natural, and naturally enough the aesthetic things of life received
not too much consideration. In Colonial times the graphic
arts existed, to be sure, but in a feeble way. Painting was made
up of portraits of prominent people; only an occasional artist
was disposed towards historical pictures; but the total result
added little to the sum of art or to the tale of history. The first
artist of importance was J. S. Copley (1735-1819), with whom
painting in America really began. Benjamin West (1739-1820)
belongs in the same period, though he spent most of his life in
England, and finally became President of the Royal Academy.
As a painter he is not to be ranked so high as Copley. In
the early part of the 19th century two men, John Trumbull (1756-
1843), a historical painter of importance, and Gilbert Stuart
(1755-1828), a pre-eminent portrait painter, were the leaders;
and after them came John Vanderlyn (1773-1852), Washington
Allston (1779-1843), Rembrandt Peale (1787-1860), J. W.
Jarvis (1796-1841), Thomas Sully (born in England, 1783-1872)
—men of importance in their day. The style of all this early
art was modelled upon that of the British school, and indeed
most of the most had studied in England under the mastership
of West, Lawrence and others. The middle or second period
of painting in the United States began with the landscape work
of Thomas Doughty (1793-1856) and Thomas Cole (1801-1848).
It was not a refined or cultivated work, for the men were in great
measure self-taught, but at least it was original and distinctly
American. In subject and in spirit it was perhaps too panoramic
and pompous; but in the hands of A. B. Durand (1796-1886),
J. F. Kensett (1818-1872) and F. E. Church (1826-1900), it was
modified in scale and improved in technique.

A group of painters called the Hudson River school finally
emerged. To this school some of the strongest landscape
painters in the United States owe their inspiration, though in
almost every case it has been the modern influence of foreign study. Contemporary with Cole came the portrait
painters Chester Harding (1792-1866), C. L. Elliott (1812-1868),
Henry Inman (1800-1846), William Page (1811-1835), G. P. A.
Healy (1813-1894), Daniel Huntington and W. S. Mount (1807-
1868), one of the earliest genre painters. Foreign art had been
followed to good advantage by most of these painters, and as a
result some excellent portraits were produced. The excellence
of the work was not, however, appreciated by the public generally
because art knowledge was not at that time a public possession.
Little was required of the portrait painter beyond a recognizable
likeliness. A little later the teachings of the Düsseldorf school
began to have an influence upon American art through Leutze
(1816-1868), who was a German pupil of Lessing, and went to
America to paint historical scenes from the War of Independence.
But the foreign influence of the time to make the most impression
came from France in 1855 with two American pupils of Couture
and momentous movement at Philadelphia in 1859. More
Hunt and also a pupil of Millet at Barbizon, who was the real
introductor of the Barbizon painters to the American people.
After his return to Boston his teaching and example had much
weight in moulding artistic opinion. He, more than any other,
turned the rising generation of painters towards the Paris schools.
Contemporary with Hunt and following him were a number of
painters, some self-taught and some schooled in Europe, who
brought American art to a high standard of excellence. George
Fuller (1822-1854), Eastman Johnson, Elihu Vedder, produced
work of much merit; and John La Farge and Winslow Homer
were unquestionably the foremost painters in the United States
at the opening of the 20th century. In landscape the three
strongest men have passed away—A. H. Wyant, George Inness,
and Homer Martin. Swain Gifford, Edward Gay, Thomas Moran,
Jervis McEntee, Albert Bierstadt, are other landscape painters
of note who belonged to the middle period and reflected the
traditions of the Hudson River school to some extent. With
the Centennial Exhibition and the spread of influence the
emergent movement in American art began to shape itself.
The display of pictures at Philadelphia, the national prosperity,
and the sudden development of the wealth of the United States
had doubtless much to do with it. Many young
men from all parts of the country took up the study of art and
began going abroad for instruction in the schools at Munich,
and, later, at Paris. Before 1880 some of them had returned
to the United States and founded schools and societies of art, like
the Art Students' League and the Society of American Artists.
The movement spread to the Western cities, and in a few years
museums and art schools began to appear in all the prominent
towns, and a national interest in art was awakened. After
1870 the predominant influence, as regards technical training,
was French. Many students still go to Paris to complete their
studies, though there is a large body of accomplished painters
teaching in the home schools, with satisfactory results as regards
the work of their pupils. From their French training, many of the American artists have been charged with echoing Parisian art, and the charge is partly true. They have accepted French methods because they think them the best, but their subjects and motives are sufficiently original.

Under separate biographical headings a number of modern American artists are noticed. Some of the greatest Americans however can hardly be said to belong to any American school. James McNeill Whistler, though American-born, is an example of the modern man without a country. E. A. Abbey, John S. Sargent, Mark Fisher and J. J. Shannon are American only by birth. They became resident in London and must be regarded as cosmopolitan in their methods and themes. This may be said with equal truth of many painters resident in Paris and elsewhere on the Continent. However good as art it may be, there is nothing distinctively American about the work of W. T. Dannat, Alexander Harrison, George Hitchcock, Gari Melchers, C. S. Pearce, E. L. Weeks, J. L. Stewart and Walter Gay. If they owe allegiance to any centre or city, it is to Paris rather than to New York.

During the last quarter of the 19th century much effort and money were devoted to the establishment of institutions like the Metropolitan Museum in New York, the Carnegie Museum at Pittsburgh, and the Art Institute in Chicago. Every city of importance in the United States now has its gallery of paintings. Schools of technical training and societies of artists likewise exist wherever there are important galleries. Exhibitions during the winter season and at great national expositions give abundant opportunity for rising talent to display itself; and, in addition, there has been a growing public patronage of painting, as shown by the extensive mural decorations in the Congressional Library building at Washington, in the Boston Public Library, in many colleges and churches, in courts of justice, in the reception-rooms of large hotels, in theatres and elsewhere.

(J. C. VAN D.)

PAISIELLO—PAISLEY

PAISIELLO (or PAESIELLO), GIOVANNI (1741—1816), Italian musical composer, was born at Tarento on the 9th of May 1741. The beauty of his voice attracted so much attention that in 1754 he was removed from the Jesuit college at Tarento to the Conservatorio di S. Onofrio at Naples, where he studied under Durante, and in process of time rose to the position of assistant master. For the theatre of the Conservatorio, which he left in 1763, he wrote some intermezzi, one of which attracted so much notice that he was invited to write two operas, La Pupilla and Il Mondo al Rovescio, for Bologna, and a third, Il Marchese di Tulpipano, for Rome. His reputation being now firmly established, he settled for some years at Naples, where, notwithstanding the popularity of Piccini, Cimarosa and Guglielmi, of whose triumphs he was bitterly jealous, he produced a series of highly successful operas, one of which, L’Idolo cinese, made a deep impression upon the Neapolitan public. In 1772 Meiggs began to write church music, and composed a requiem for Gennara Borbone. In the same year he married Cecilia Pallini, with whom he lived in continued happiness. In 1776 Paisielo was invited by the empress Catherine II. to St. Petersburg, where he remained for eight years, producing, among other charming works, his masterpiece, Il Barbiere di Siviglia, which soon attained a European reputation. The fate of this delightful opera marks an epoch in the history of Italian art; for with it the gentle suavity cultivated by the masters of the 18th century died out to make room for the dazzling brilliancy of a later period. When, in 1816, Rossini set the same libretto to music, under the title of Armavia, it was hissed from the stage; but it made its way, nevertheless, and under its changed title, Il Barbiere, is now acknowledged as Rossini’s greatest work, while Paisielo’s opera is consigned to oblivion—a strange instance of poetical vengeance, since Paisielo himself had many years previously endeavoured to eclipse the fame of Pergolesi by resetting the libretto of his famous intermezzo, La Sera padrana.

Paisielo quitted Russia in 1784, and, after producing Il Re Teodoro at Vienna, entered the service of Ferdinand IV. at Naples, where he composed many of his best operas, including Nina and La Molinara. After many vicissitudes, resulting from political and dynastic changes, he was invited to Paris (1802) by Napoleon, whose favour he had won five years previously by a march composed for the funeral of General Hoche. Napoleon treated him munificently, while cruelly neglecting two far greater composers, Cherubini and Méhul, to whom the new favourite transferred the hatred he had formerly borne to Cimarosa, Guglielmi and Piccini. Paisielo conducted the music of the court in the Tulleries with a stipend of 10,000 francs and 4800 for lodging, but he entirely failed to conciliate the Parisian public, who received his opera Proserpine so coldly that, in 1803, he requested and with some difficulty obtained permission to return to Italy, upon the plea of his wife’s ill health. On his arrival at Naples Paisielo was reinstated in his former appointments by Joseph Bonaparte and Murat, but he had taxed his genius beyond its strength, and was unable to meet the demands now made upon it for new ideas. His prospects, too, were precarious. The power of the Bonaparte family was tottering to its fall; and Paisielo’s fortunes fell with it. The death of his wife in 1815 tried him severely. His health failed rapidly, and constitutional jealousy of the popularity of others was a source of worry and vexation. He died on the 5th of June 1816.

Paisielo’s operas (of which he is known to have composed 94) abound with melodies, the graceful beauty of which is still warmly appreciated. Perhaps the best known of these airs is the famous “Nel cor più” from La Molinara, immortalized by Beethoven’s delightful variations. His church music was very voluminous, comprising eight masses, besides many smaller works; he also produced fifty-one instrumental compositions and many detached pieces. MS. scores of many of his operas were presented to the library of the British Museum by Dragonetti.

The library of the Geralomini at Naples possesses an interesting MS. compilation recording Paisielo’s opinions on contemporary composers, and exhibiting him as a somewhat severe critic of the work of Pergolesi. His Life has been written by F. Schizze (Milan, 1833).

PAISLEY, CLAUD HAMILTON, LORD (c. 1543—1622), Scott- tish politician, was a younger son of the 2nd earl of Arran. In 1553 he received the lands of the abbey of Paisley, and in 1568 he aided Mary Queen of Scots to escape from Lochleven castle, afterwards fighting for her at the battle of Langside. His estates having been forfeited on account of these proceedings, Hamilton was concerned in the murder of the regent Murray in 1570, and also in that of the regent Lennox in the following year; but in 1573 he recovered his estates. Then in 1579 the council decided to arrest Claud and his brother John (afterwards 1st marquess of Hamilton) and to punish them for their past misdeeds; but the brothers escaped to England, where Elizabeth used them as pawns in the diplomatic game, and later Claud lived for a short time in France. Returning to Scotland in 1586 and mixing again in politics, Hamilton sought to reconcile James VI. with his mother, and in conjunction with Philip II. of Spain in the interests of Mary and the Roman Catholic religion, and neither the failure of Anthony Babington’s plot nor even the defeat of the Spanish Armada put an end to these intrigues. In 1589 some of his letters were seized and he suffered a short imprisonment, after which he practically disappeared from public life. Hamilton, who was created a Scottish baron as Lord Paisley in 1587, was insane during his concluding years. His eldest son James was created earl of Abercorn (q.v.) in 1606.

PAISLEY, a municipal and police burgh of Renfrewshire, Scotland, on the White Cart, 3 m. from its junction with the Clyde, 7 m. W. by S. of Glasgow by the Glasgow & South-Western and Caledonian railways. Pop. (1891), 66,425; (1901) 79,363. In 1791 the river, which bisects the town, was made navigable for the passage of 50 tons and further deepened a century later. It is crossed by several bridges—including the Abercorn, St. James’s and the Abbey Bridges—and two railway viaducts. The old town, on the west bank of the stream, contains most of the principal warehouses and mills; the new town, begun towards the end of the 18th century, occupies much of the level ground
that once formed the domains of the abbey. To the munificence of its citizens the town owes many of its finest public buildings. Opposite to the abbey church (see below), stands the town hall (1820–1822), which originated in a bequest by George Aitken Clark (1823–1873), and was completed by his relatives, the thread manufacturers of Anchor Mills. The new county buildings (1891) possess a handsome council hall, and the castellated municipal buildings (1818–1821) were the former county buildings; the sheriff court house (1882) in St James Street, and the free library and museum (including a picture gallery) at the head of High Street, were erected (1860–1872) by Sir Peter Coats (1808–1890). In Oakshaw Street stands the observatory (1883), the gift of Thomas Coats (1809–1885). Besides numerous board schools, the educational establishments include the John Neilson Endowed Institute (1852) on Oakshaw Hill, the grammar school (founded, 1576; rebuilt, 1884), and the academy for secondary education, and the technical college, in George Street. Among charitable institutions are the Royal Alexandra Infirmary, the Victoria Eye Infirmary (founded by Provost Mackenzie in 1809), the burgh asylum at Riccartonbar, the Abbey Poorhouse (including hospital and lunatic wards), the fever hospital and reception house, the Infectious Diseases Hospital and the Gleniffer Home for Incurables. The Thomas Coats Memorial Church, belonging to the Baptist body, erected by the Coats family from designs by H. J. Blanc, R.S.A., is one of the finest modern ecclesiastical structures in Scotland. It is an Early English and Decorated cruciform building of red sandstone, with a tower surmounted by a beautiful open-work crown. Of parks and open spaces there are in the south, Brodie Park (22 acres), presented in 1871 by Robert Brodie; towards the north Fountain Gardens (7½ acres), the gift of Thomas Coats and named from the handsome iron fountain standing in the centre; in the north-west, St James Park (40 acres), with a racecourse (racing dates from 1620, when the earl of Abercorn and the Town Council gave silver bells for the prize); Dunn Square and the old quarry grounds converted and adorned; and Moss Plantation beyond the north-western boundary. There are the cemeteries at Hawkhead and at the west side of the town. Under the Reform Act of 1832 the burgh returns one member to Parliament. The town is governed by a council, with provost and bailies, and owns the gas and water supplies and the electric lighting. In the abbey precincts are statues to the poet Robert Tannahill (1774–1810) and Alexander Wilson (1766–1813), the American ornithologist, both of whom were born in Paisley, and, elsewhere, to Robert Burns, George Aitken Clark, Thomas Coats and Sir Peter Coats.

Paisley has been an important manufacturing centre since the beginning of the 18th century, but the earlier linen, lawn and silk-gauze industries have become extinct, and even the famous Paisley shawls (imitation cashmere), the sale of which at one time exceeded £1,000,000 yearly in value, have ceased to be woven. The manufacture of linen thread, introduced about 1720 by Christian Shaw, daughter of the laird of Bargarne, grew in 1812 to that of cotton thread, which has since grown to be Paisley’s chief industry. The large number of Lancashire (J. & P. Coats) and Anchor mills (Clark & Company) are now the dominant factors in the combination that controls the greater part of the thread trade of the world and together employ 10,000 hands. Other thriving industries include bleaching, dyeing, calico-printing, weaving (carpets, shawls, tartans), engineering, tanning, iron and brass founding, brewing, distilling, and the making of starch, cornflour, soap, marmalade and other preserves, some beside building in the yards on the left bank of the White Cart.

The abbey was founded in 1163 as a Cluniac monastery by Walter Fitzalan, first High Steward of Scotland, the ancestor of the Scottish royal family of Stuart, and dedicated to the Virgin, St James, St Milburga of Much Wenlock in Shropshire (whence came the first monks) and St Mirinus (St Mirren), the patron-saint of Paisley, who is supposed to have been a contemporary of St Columba. The monastery became an abbey in 1279, was destroyed by the English under Aymer de Valence, earl of Pembroke, in 1307, and rebuilt in the latter half of the 14th century, the Stuarts ending it lavishly. At the Reformation (1561) the fabric was greatly injured by the 5th Earl of Glencairn and the Protestants, who dismantled the altar, stripped the church of images and relics, and are even alleged to have burnt it. About the same date the central spire, 300 ft. high, built during the abbacy of John Hamilton (1511–1571), afterwards archbishop of St Andrews, collapsed, demolishing the choir and north transept. In 1553 Lord Claud Hamilton, then a boy of ten, was made abbot, and the abbacy and monastery were erected into a temporal lordship in his favour in 1587. The abbey lands, after passing from his son the earl of Abercorn to the earl of Angus and then to Lord Dundonald, were purchased in 1764 by the 8th earl of Abercorn, who intended making the abbey his residence, but let the ground for building purposes. The abbey church originally consisted of a nave, choir without aisles, and transepts. The nave, in the Transitional and Decorated styles, with a rich pointed triforium of broad round arches, has been restored, and used as the parish church since 1862. The graceful west front has a deeply recessed Early Pointed doorway, surmounted by tracery windows and, above these, by a handsome Decorated stained-glass window of fire lights. Of the choir only the foundations remain to indicate its extent; at the east end stood the high altar before which Robert III. was interred in 1406. Over his grave a monument to the memory of the Royal House of Stuart was placed here by Queen Victoria (1888). The restored north transept has a window of remarkable beauty. The south transept contains St Mirren’s chapel (founded in 1490), which is also called the “Sounding Aisle” from its echo. The chapel contains the tombs of abbot John Hamilton and of the children of the 1st lord Paisley, and the recumbent effigy of Marjory, daughter of Robert Bruce, who married Walter, the Steward, and was killed while hunting at Knock Hill between Renfrew and Paisley (1310).

About 3 m. S. of Paisley are the pleasant braes of Gleniffer, sung by Tannahill, and 2½ m. S.E., occupying a hill on the left bank of the Leven, stand the ruins of Crookston Castle. The castle is at least as old as the 12th century and belonged to Robert de Croc, who witnessed the charter of the foundation of Paisley Abbey. In the following century it passed into the possession of a branch of the Stewarts, who retained it until the murder of Darnley (1567). Afterwards it changed hands several times, but was finally acquired from the Montrose family by Sir John Maxwell of Pollok.

The Romans effected a settlement in Paisley in a.d. 84, and built a fort called Vindawara on the high ground (Oakshaw Hill) to the west of the White Cart. The place seems to have been first known as Paslet or Passeleth, and was assigned along with certain lands in Renfrewshire to Walter Fitzalan, founder of the abbey. The village grew up round the abbey, and by the 15th century had become sufficiently important to excite the jealousy of the neighbouring burgh of Renfrew. To protect it from molestation Abbot Schaw (or Shaw) induced James IV., the king, to visit it, to erect it into a burgh of barony in 1488, a charter which gave it the right to return a member to the Scots parliament.

See Charterful of the Monastery of Paisley, published by the Maitland Club (1852); J. Cameron Lees, The Abbey of Paisley (1878); Swan, Description of the Town and Abbey of Paisley (1852); and Robert Brown, History of Paisley (1886).

PAITA, or Paita, a seaport of northern Peru, chief town of the province of Paita in the department of Piura. Pop. (1906 estimate), 3800. The town has one of the best natural harbours of the Peruvian coast, is a port of call for the regular mail steamers between Valparaiso and Panama, and is the port of the departmental capital, Piura, with which it is connected by a railway 60 m. long. It is also the Pacific terminus of the railway across the Andes to Puerto Limon, on the Maranon, or upper Amazon. Paita faces on the bay of Paita, and is sheltered from southerly winds by a headland called Punta Paita and by a large hill called the Silla de Paita. The water
supply is brought from the river Chira (17 m. distant). The exports include cotton, tobacco, petroleum, cattle, hides and straw hats. Paktok rapidly grew into commercial importance, owing partly to the complete freedom which it enjoyed from taxation, and partly to the diversion of trade produced by the T'ai-p'ing rebellion. The establishment of a number of customs-house and the opening of the ports of Hanoi and Haiphong for a time threatened to injure its prospects; but, foreign trade being permitted in 1876–1877, it began in 1879 to be regularly visited by foreign steamers. The Chinese town stands on the peninsula and faces due north. From the bluff, on which all the foreign communities live, a partly cultivated plain extends. Liquid indigo, sugar, aniseed and aniseed oil, cassia-lignea and cassia oil, cuttle-fish and hides are the chief exports. With Macao especially an extensive junk trade is carried on. A large number of the inhabitants engage in fishing and fish-curing. The preparation of dried fish is a specialty of Paktok, the fish being exported to Hong Kong.

PAKINGTON, the name of a famous English Worcestershire family, now represented by the barony of Hampton. Sir John Pakington (d. 1560) was a successful lawyer and a favourite at court, and Henry VIII. enriched him with estates, including that of Westwood in Worcestershire. His grandnephew and heir, Sir John Pakington (1549–1625), was another prominent politician. John Pakington was famous for his magnificence of living. His son, John (1606–1680), created a baronet in 1620. His son, Sir John, the second baronet (1660–1680), played an active part on the royalist side in the troubles of the Great Rebellion and the Commonwealth, and was taken prisoner at Worcester in 1652; Lady Dorothy, his wife (d. 1679), daughter of the lord keeper Thomas Coventry, was famous for her learning, and was long credited with the authorship of The Whole Duty of Man (1658), which has more recently been attributed to Richard Allestree (q.v.). Their grandson, Sir John, the 4th baronet (1671–1727) was a pronounced high Tory and was very prominent in political life; for long he was regarded as the original of Addison’s Sir Roger de Coverley, but the reasons for this supposition are now regarded as inadequate. The baronetcy became extinct with the death of Sir John Pakington, the 8th baronet, in January 1850, but it was revived in 1846 for his maternal nephew and heir, John Somerset Pakington (1799–1860), whose name was originally Russell. Born on the 20th of February 1799 and educated at Eton and at Oxford University, he embarked on a long career as an active and industrious Conservative politician, being four times returned to parliament for Droitwich from 1837 to 1874. He was secretary for war and the colonies in 1852, first lord of the admiralty in 1858–1859 and again in 1866–1867; and secretary of state for war in 1867–1868. In 1874 he was created Baron Hampton, and he died in London on the 9th of April 1880. From 1875 until his death Hampton was chief civil service commissioner. In 1906 his grandson Herbert Stuart (b. 1883) became 4th baron Hampton.

It is interesting to note that in 1529 Henry VIII. granted Sir John Pakington the right of wearing his hat in the royal presence.

PAKOKKU, a district in the Minbu division of Upper Burma, lying west of the Irrawaddy river and south of Mandalay, with the line of the Chiu hills as a general boundary on the west. It has an area of 6210 sq. m. and a population (1901) of 356,489.

The part of the district along the Irrawaddy and Chindwin rivers is alluvial. Beyond this, however, the country rises gradually to the low Shindamaung and Tangyi ridges, where it is very arid. To the westward there is a rapid drop to the well-watered valley of the Yaw River, and then a rise over broken, dry country before the valley of the Chindwin is reached. The principal products are millet, sesame and sugar produced from toddy-palms in the riverine districts, which also grow rice, grain, peas and beans. Tobacco and vegetables are also produced in some quantity, and maize is grown largely for the sake of the husk, which is used for native cherooot-wrappers, under the name of yaujet. The Yennanyat oil-fields, which produce quantities of petroleum, are in the south of the district, and iron used to be worked in a small way. There are 1151 sq. m. of reserved forests in the
district. A good deal of tea and cutch is worked out. The
cutch of the Yaw country is particularly esteemed. The average
rainfall is about 50 inches per annum, and in many places
water has to be carted for miles. West of the Pondaung ridge,
however, under the Chin hills, the rainfall exceeds 50 inches.
The heat in May and June is very great, and the thermometer
varies considerably above 100° F. in the shade.

The great majority of the population is Burmese, but in Yaw
there is a peculiar race called Taungas, who claim to be quite
distinct from both Burmese and Chins. In 1901 the Taunghas
numbered 57,000.

The headquarters town, Pakokku, stands on the right bank of
the Irrawaddy, and has grown into importance since the British
occupation. It is the great boat-building centre of Upper
Burma. The population in 1901 was 19,456. It may be
said to be the emporium of the trade of the Chinwind and
Yaw river valleys. The steamers of the Irrawaddy Flotilla
Company call here regularly, and it is the starting-point for the
vessels plying on the Chinwind.

PAL—PALACIO

KRUPO DAS (1839–1884), Indian publicist, was born in
Calcutta in 1839, of the Telgi oil-man’s caste, which ranks low
in the Hindu social hierarchy. He received an English education
at the Oriental Seminary and the Hindu Metropolitan
College, and at an early age devoted himself to journalism. In 1861 he was
appointed assistant secretary (and afterwards secretary) to the
British Indian Association, a board of Bengal landlords, which
numbered among its members some of the most cultured men of
the day. At about the same time he became editor of the
Hindu Patriot, originally started in 1853 and conducted with
ability and zeal by Harish Chandra Mukerji until his death in
1861. This journal having been transferred by a trust deed to
some members of the British Indian Association, it henceforth
began to become to some extent an organ of that body. Thus KRISTO
Das Pal had rare opportunities for proving his abilities and
independence during an eventful career of twenty-two years.
In 1863 he was appointed Justice of the peace and municipal
commissioner of Calcutta. In 1872 he was made a member of
the Bengal legislative council, where his practical good sense and
moderation were much appreciated by successive lieutenant-
governors. His opposition, however, to the Calcutta Municipal
Bill of 1876, which first recognized the elective system, was
attributed to his prejudice in favour of the “classes” against
the “masses.” In 1878 he received the decoration of C.I.E.
In 1883 he was appointed a member of the viceroy’s legislative
council. In the discussions on the Rent Bill, which came up for
consideration before the council, Kristo Das Pal, as secretary
to the British Indian Association, necessarily took the side of
the landlords. He died on the 24th of July 1884. Speaking
after his death, Lord Ripon said: “By this melancholy event we
have lost from among us a colleague of distinguished ability,
from whom we had on all occasions received assistance, of which
I readily acknowledge the value. . . . Mr Kristo Das Pal owed
the honourable position to which he had attained to his own
exertions. In his intellectual attainments of a high order, his
rhetorical gifts were acknowledged by all who heard him, and
were enhanced when addressing this council by his thorough
mastery over the English language.” A full length statue of
him was unveiled by Lord Elgin at Calcutta in 1894.

See N. N. Ghose, Kristo Das Pal, a Study (Calcutta, 1887).

PALACE (Lat. Palatium, the name given by Augustus to his
residence on the Palatine Hill), primarily the residence of a
sovereign or prince, but in England, Spain and France extended
to the residence of a bishop, and in the latter country to buildings
appropriated to the public service, such as courts of justice, &c.
In Italy the name is given to royal residences, to public buildings,
and to such large mansions as in France are either known as
détaux if in the country, or hôtels if in Paris.

The earliest palaces in Egypt are those built in the rear of the
Temple of Karnak by Thothmes III. and near the Temple
of Medinet Habu, both in Thebes; the earliest in Greece are those
of Cronus and Phaestus in Crete (c. 1500 B.C.), and at Tiryns in
the citadel (c. 1200 B.C.). The most remarkable series are those
erected by the Assyrians at Nimrud, Koyunjik and Khorsabad
(850–669 B.C.), which were followed by the Persian palaces at
Persepolis and Susa; the Parthian palaces at At Hâlistân and
Diarbekr; and the Sassanian palaces of Serbistan, Firuzabad
and Ctesiphon. The only palace known of the late Greek style
is that found at Palatitza in Macedonia. Of the Roman period
there are many examples, beginning with those on the Palatine
Hill commenced by Augustus, continued and added to by his
successors, Tiberius, Caligula, Domitian, Hadrian and Septimus
Severus, which covered an area of over 1,000,000 sq. ft. The
villa of Hadrian was virtually an immense palace, the buildings
of which extended over 7 m. in length; of more modest propor-
tions are the palace of Diocletian at Spalato and a fine example
at Trèves in Germany. The palace of the Hebdomon at
Constantinople, and a fragment at Ravenna of Theodoric’s work, are
all that remain of Byzantine palaces. Of Romanesque work
the only examples are those at Geinhausen built by Barbarossa,
and the Wartburg in Germany. In the Gothic style in Italy, the
best known examples are the ducal palace at Venice, and the
Palazzi Vecchio and del Podesta (Bargello) at Florence; in
France, the palace of the popes at Avignon, and the episcopal
palaces of Beauvais, Laon, Poitiers and Lisleux; in England, the
bishops’ palaces of Wells, Norwich, Lincoln, portions of Edward
the Confessor’s palace at Westminster, and Wolsey’s palace at
Hampton Court; while such great country mansions as the
“castles” of Alnwick, Kenilworth, Warwick, Rochester,
Raglan and Stokesay, or Haddon Hall, come in the same
category though the name is not employed. Belonging to the
Mahomedan style are the palaces of the Alhambra and the
Alcazar in Spain. Of the Renaissance period, numerous
palaces exist in every country, the most important examples in
Italy being those of the Vatican, the Quirinal and the
Cancellaria, in Rome; the Caprarola near Rome; the palace
of Caserta near Naples; the Pitti at Florence; the Palazzo di Te
at Mantua; the court and eastern portion of the ducal palace
of Venice, and the numerous examples of the Grand Canal;
in France, the Louvre, the Tulleries (destroyed), and the
Luxembourg, in Paris; Versailles and St Germain-en-Laye; and
the châteaux of the Rochefoucauld, Fontainebleau, Chambord,
Blois, Amboise, Chenonceaux and other palaces on the Loire;
in Germany, the castle of Heidelberg, and the Zwinger palace
don Dresden; in Spain, the palace of Charles V. at Granada,
the Escorial and the palace of Madrid; in England, the palace of
Whitehall by Inigo Jones, of which only the banqueting hall was
built, Windsor Castle, Blenheim, Chatsworth, Hampton
Court; and in Scotland, the palaces of Holyrood and Linlithgow.

PALACIO VALDÉS, ARMANDO (1853–1930), Spanish
novelist and critic, was born at Entralgo, in the province of Asturias,
the 4th of October 1853. His first writings were printed in the
Revista Europea. These were pungent essays, independent judgment and refined humour, and found so much
favour with the public that the young beginning was soon ap-
pointed editor of the Revista. The best of his critical work is
El Libro de la Era del Siglo (1919) and Recuerdos
edespañoles (1875), Nueva viaje al Parnaso (1881).
His last being written in collaboration with Leopoldo Alas.
In 1881 he published a novel, El Señorío Octavo, which shows an
uncommon power of observation, and the promise of better
things to come. In María y María (1883), a portrayal of
the struggle between religious vocation and earthly passion,
some-
what in the manner of Valera, Palacio Valdés achieved a very
popular triumph which placed him in the first rank of contem-
porary Spanish novelists. El Idilio de un enfermo (1884), which
is a most interesting fragment of autobiography, has scarcely met
with the recognition which it deserves: perhaps because the
paths of the story is too unadorned. The publication of Pereda’s Sotileza is doubtless responsible for the conception
of José (1885), in which Palacio Valdés gives a realistic picture
of the manners and customs of seafaring folk, creates the two
convincing characters whom he names José and Leonarda, and
embellishes the whole with passages of animated description
barely inferior to the finest penned by Pereda himself. The
PALACKÝ—PALAEMON

emotional imagination of the writer expressed itself anew in the
charming story Ritería (1886), one of whose attractive
delights into the heroine of Maximina (1887); and
from Maximina, in its turn, is taken the novice who figures
as a professed nun among the personages of La Hermana San
Salpíco (1889), in which the love-passages between Zeferino
Sanjurjo and his love are written in an elaborate
romantic descriptions of Seville. El Cuatro poder (1888) is, as
its name implies, concerned with the details, not always edifying,
of journalistic life. Two novels issued in 1892, La Espuma and
La Fe, were enthusiastically praised in foreign countries, but
in Spain their reception was cold. The explanation is to be
found in the fact that the first of these books is an avowed satire
on the Spanish aristocracy, and that the second was construed
into an attack upon the Roman Catholic Church. During the
acrimonious discussion which followed the publication of La
Espuma, it was frequently asserted that the artist had improvised
a fantastic caricature of originals whom he had never seen; yet
as the characters in Coloma’s Pequeñeces are painted in darker
tones, and as the very critics who were foremost in charging
Palacio Valdés with incompetence and ignorance are almost
unanimous in praising Coloma’s fidelity, it is manifest that the
indictment against La Espuma was based on preconceived
suppositions. Palacio Valdés returned to his earlier and better manner
in Los Mayos de Cádiz (1896) and in La Algería del Capitán Ribot
(1899). In these novels, and still more in Tristán, el desponsismo
(1906), he frees himself from the reproach of undue submission
to French influences. In any case he takes a prominent place in
modern Spanish literature as a keen analyst of emotion and a
sympathetic, delicate, humorous observer.

(J. F. K.)

PALACKÝ, FRANTIŠEK [FRANCIS] (1798-1876), Czech
historian and politician, was born on the 14th of June 1798 at
Hodslavice (Hotzendorf) in Moravia. His ancestors had been
members of the community of the Bohemian Brethren, and had
secretly maintained their Protestant belief throughout the
period of religious persecution, eventually giving their adherence
to the Augsburg confession as approximate to their original
faith. Palacky’s father was a schoolmaster and a man of some
learning. The son was born in 1812 to the Protestant gymnasium
at Pressburg, where he came in contact with the philologist
Šaľařík and became a zealous student of the Slav languages.
After some years spent in private teaching Palacky settled in
1823 at Prague. Here he found a warm friend in Dobovský,
whose good relations with the Austrian authorities shielded him
from the hostility shown by the government to students of Slav
subjects. Dobovský introduced him to Count Sternberg and his
brother Francis, both of whom took an enthusiastic interest in
Bohemian history. Count Francis was the principal founder
of the Society of the Bohemian Museum, devoted to the collection
documents bearing on Bohemian history, with the object of
reawakening national sentiment by the study of the national
records. Public interest in the movement was still illustrated in 1825
by the new Journal of the Bohemian Museum (Casopis českého
Muzea), of which Palacky was the first editor. The journal was
at first published in Czech and German, and the Czech edition
survived to become the most important literary organ of
Bohemia. Palacky had received a modest appointment as archi-
vist to Count Sternberg and in 1830 the Bohemian estates
sought to confer on him the title of historiographer of Bohemia, with
a small salary, but it was ten years before the consent of the
Viennese authorities was obtained. Meanwhile the estates, with
the tardy assent of Vienna, had undertaken to pay the expenses of
publishing Palacky’s capital work, The History of the Bohemian
People (5 vols., 1836–1867). This book, which comes down to
the year 1526 and the extinction of Czech independence, was founded
on laborious research in the local archives of Bohemia and in
the libraries of the chief cities of Europe, and remains the stand-
dard authority. The first volume was printed in 1826 and
subsequently translated into Czech. The publication of the
work was hindered by the police-censorship, which was
especially active in criticizing his account of the Hussite move-
ment. Palacky, though entirely national and Protestant in
his sympathies, was careful to avoid an uncritical approbation of
the Reformers’ methods, but his statements were held by
the authorities to be dangerous to the Catholic faith. He
was therefore compelled to make excisions from his narrative and
to accept as integral parts of his work passages interpolated by
the censors. After the abolition of the police-censorship in
1848 Palacky published an emended edition, which still
follows the pattern of the original form of the work. The fairest and most considerable
of Palacky’s antagonists in the controversy aroused by his
narrative of the early reformation in Bohemia was Baron
Helfert, who received a brief from Vienna to write his His und
Hieronymus (1853) to counteract the impression made by
Palacky’s History, K. A. K. Höfler, a German professor of
history at Prague, edited the historical authorities for the
period in a similar sense in his Geschichte der hussitischen
Bewegung in Böhmen. Palacky’s reply was in Geschichte des
Hussitenthaumes und Professor Löffler (Prague, 1868) and Zur
böhmischen Geschichteschreibung (Prague, 1871).

The revolution of 1848 forced the historian into practical
politics. He was deputed to the Reichstag which sat at
Kroměříž (Kremser) in the autumn of that year, and was a
member of the Slav congress at Prague. He refused to take
part in the constitution of the permanent National Assembly
and the republic, and his friend, the poet C. E. Kolář, who
was a deputy to the diet, which met at Frankfort, on the ground
that as a Czech he had no interest in German affairs. He was at
this time in favour of a strong Austrian empire, which should
consist of a federation of the southern German and the Slav
states, allowing of the retention of their individual rights.
These views met with some degree of consideration at Vienna,
and Palacky was even offered a portfolio in the Pillersdorf
cabinet. The collapse of the federal idea and the definite
triumph of the party of reaction in 1852 led to his retirement
from politics. After the liberal concessions of 1860 and 1861,
however, he became a life member of the Austrian senate. His
views met with small support from the assembly, and with the
exception of a short period after the decree of September 1871,
by which the emperor raised hopes for Bohemian self-government,
he ceased to appear in the senate from 1861 onwards. In
the Bohemian Landtag he became the acknowledged leader
of the nationalistic-federal party. He sought the establishment
of a Czech kingdom which should include Bohemia, Moravia,
and Silesia, and in his zeal for Czech autonomy he even entered into
an alliance with the Conservative nobility and with the extreme
Catholics. He attended the Panslavist congress at Moscow in
1867. He died at Prague on the 26th of May 1876.

Among his more important smaller historical works are: Würdigung
der alten böhmischen Geschichteschreiber (Prague, 1839), dealing
with authors of many of whose works were then inaccessible to
Czech students; Archiv český (6 vols., Prague, 1840–1872); Urgnund-
lische Beiträge zur Geschichte des Hussitenkriegs (3 vols., Prague,
1872–1874); Documeta magistri Johannis Hus vitam, doctrinam,
causam illustrativa (Prague, 1866). With Stezár he wrote Anfangs
der böhmischen Dichtkunst (Pressburg, 1818) and Die
die ältesten Denkmäler der böhmischen Sprache (Prague, 1840).
Three volumes of his Czech articles and essays were published as Radhost
(Prague, 1852–1872). For accounts of Palacky see an article
by Saint-Fléau Taillandier in the Revue des deux mondes (April, 1855);
Count Lützow, Lectures on the Historians of Bohemia
(London, 1903).

PALADIN (Lat. palatinus), strictly a courtier, a member of
a royal household, one connected with a palace. From being
applied to the famous twelve peers of Charlemagne, the word
became a general term in romance for knights of great prowess.

PALAEMON, QUINTUS REMMIUS, Roman
grammarians, a native of Vicentia, lived in the reigns of Tiberius and Claudius.

From Suetonius (De grammaticis, 23) we learn that he was
originally a slave who obtained his freedom and taught grammar
at Rome. Though a man of propitiating and arrogant character,
he enjoyed a great reputation as a teacher; Quintilian and
Pliny have left us a full account of his life. He was the author of
a grammatical work, De aeterna et divina veritate, which was
lost, and his lessons are preserved in a manuscript (Vindob. vii. 215), a system of grammar much used in his own time
and largely drawn upon by later grammarians, contained rules for
correct diction, illustrative quotations and treated of barbarisms
and solecisms (Juvenal vi. 452). An extant Ars grammatica
(discovered by Jovianus Pontanus in the 15th century) and

PALAEOBOTANY.

In the present article the subject of vegetable palaeontology is treated from a botanical point of view. The science of botany is concerned with the vegetable kingdom as a whole, and not merely with the flora now living. The remains of the plants of former periods, which have come down to us in the fossilized state, are almost always fragmentary, and often imperfectly preserved; but their investigation is of the utmost importance to the botanist, as affording the only direct evidence of the past history of vegetable organisms. Since the publication of the Origin of Species the general acceptance of the doctrine of the descent of species has given a vastly increased significance to palaeontological data. The determination of the course of descent has now become the ultimate problem for the systematist: this is an historical question, and the historical documents available are the remains of the ancient organisms preserved in the rocks. The palaeobotanist thus endeavours to trace the history of plants in the past, with the hope of throwing light on their natural affinities and on the origin of the various groups. His investigations must embrace not only the comparative morphology and anatomy of fossil plants, but also their distribution over the earth's surface at different periods—a part of the subject which, besides its direct biological interest, has obvious bearings on ancient climatology and geography.

Preservation.—Before considering the results of palaeobotanical research it is necessary to be acquainted with the various ways by which evidence is preserved, or, in other words, with the modes of preservation of vegetable remains. These fall under two main heads. On the one hand, there is the mode of preservation which gives rise to casts, moulds and generally impressions, exhibiting the superficial features of the organic substance, and often preserving carbonaceous or siliceous fossils of this kind, and the term *petrifaction* is used as a general term to cover all such methods of fossilization. On the other hand, there are specimen in which the tissues of the plant have been preserved by removal of the external substance, thin carbonaceous layer surrounding the fossil, and the term *incrustation* is used as a general term to cover all such methods of fossilization. This second method of fossilization is termed *petrifaction*. In the case of incrustation the whole substance of the plant remains—may be preserved by mineral matter, such as sandstone or shale, giving a cast of the whole, on the surface of which the external markings, such as the bases of leaves and the scars left by their fall, are visible in their natural form. In other cases, especially, is often thus preserved, and may be removed by the use of appropriate reagents and examined microscopically. If sporangia and spores are present they also may persist in a perfectly recognizable form, and in fact much of the most important structural information on the organisation of forms and similar plants has been derived from specimens of this kind.

In many cases internal casts have been formed, some large cavity, such as a fossil rut, having become filled with mineral substance, which has taken the impress of the surrounding structures, such as the wood. The common casts of Calamites are of this nature, representing the form of the hollow medulla, and bearing on their surface the print of the nodal constrictions and of the ridges and furrows which mark the remains of the woody tissues, whilst the substance may have been removed, or may persist merely as a thin carbonaceous layer. Mistakes have often arisen from confusing these *medullary* casts with those of the stem as a whole. In the case of leaves preservation as may often be gleaned from the carbonaceous coating of impressions, the fossils preserved by *petrifaction* are the main source of our knowledge of the structural characters of ancient plants. The chemical bodies which have played the most important part as agents of petrification are the carbonic acid and carbonic acid and carbonate, such as magnesia carbonate, calcium carbonate and ferric oxide have also been concerned, either as the chief constituents of petrifac-
and Gymnosperms belonging almost entirely to families now extinct, while the Pteridophyta attained a development extending anything that they can now show. Among the lower classes of plants we have scarcely any knowledge of Palaeozoic Bryophyta: Fungi were probably abundant, but their remains give us little information; while, even among the Algae, which are better represented, well characterized specimens are scanty.

With few exceptions, the remains of Palaeozoic Algae are of comparatively little botanical interest. A vast number of "species" has been described, and the greater number of the supposed fossil Algae have no claim to be regarded as authentic records of this class of Thallophytes (Seward, 1898). The investigations of Nathorst, Wiliamson, and the others among them have been more influenced by the casts and impressions attributed to Algae had in all probability a totally different origin. Some represent the tracks or burrows of worms, crustaceans or other animals; others, the course of rills of water on a sandy or muddy shore; others, again, the marks left on the bottom by bodies drifted along the waves. In cases of doubt, evidence may be obtained from traces of organic structure, from the presence of carbonaceous matter, or, as Zeller has pointed out, by the remains of animals such as Bryozoa being attached to the cast, showing that it represents a solid body and not a mere cavity or furrow. Evidence from traces of organization is alone conclusive; the presence of carbonaceous matter, though a useful index, is not always really decisive, for carbonaceous remains may be derived from other sources than the body which left the impression.

The mere external form of the supposed Algae is rarely so characteristic as to afford satisfactory evidence of their nature. Some of the commonly referred genera, such as Neuroneis, have as little consideration, may now be considered. Of Cyanophyceae, as we should expect, the Palaeozoic remains are very doubtful. Glaciocystis, found by Renault in a coprolite of Permian age, was regarded by him as a member of this group; and Renault himself has recently brought to light what he considers as a true Cyanophyceae, although it may be, as the absence of the nucleus, considering the extreme rarity of recognizable nuclei even in the best preserved fossil tissues, can hardly be taken seriously. Gymnangia, found by Renault in the English Carboniferous, and by him considered as a member of this group, while it appears to have played a part in the origin of the ciliated protozoa, has been shown by the late deposits, to be a true member of the class Thallophyta (e.g. Lessonia) in the dimensions of the stem and its concentric rings of growth. Later writers, influenced by the occasional occurrence of transverse walls in the smaller hyphae, have laid more weight on this character. The occurrence of small tubes, or what are called Algae in Palaeozoic times, attested by such well-preserved specimens, is a fact of great interest, though their systematic position is still an open question. Pachytheca, a spherical organism, usually about a third of an inch in diameter, composed of a spongy reticulated or reticulated, or spongy, has been much investigated and discussed, with many exceptions, without any decisive light having been thrown on its nature. It was regarded as a fossil, with which it sometimes is considered. It has been shown by many observers, including Professor Zeiller, that the wall of this organism is of a single cell, and the wall of the whole tube has been regarded as having been formed by the remains of a very different from that which present at the present day.

The first evidence for the existence of Palaeozoic Bacteria was obtained in 1879 by Van Tieghem, who found that in aliquoted sections of the well-known fusisporite of the Drach Equation, the cellulose membranes showed traces of connection by butyric fermentation, such as is produced at the present day by BathbactisAmylobacter; he also claimed to have detected the organism itself. Since that time a number of fossil Bacteria have been discovered, belonging to the Palaeozoic strata, have been described by Renault, occurring in all kinds of fossilized vegetable and animal debris. The supposed Micrococci present little that is characteristic; the more definite, though far from an infallible one; in a few cases dark granules, suggestive of endospores, have been found within the rod. On the whole, the occurrence of Bacteria in Palaeozoic deposits is not very numerous, and the attempt to discriminate species among them is probably futile.

Fungi were no doubt abundant among Palaeozoic vegetation. In examining the tissues of fossil plants of that epoch nothing is more common than spores, both in the remains of the larger and among the cells; in many cases the hyphae are septate, showing that the higher Fungi (Fungi), as distinguished from the microalgae (Phycomycetes), already existed. An example of this is afforded by a fossil form described by the late J. D. Hooker (Lycopodium antiquarius, W. Smith) bears very definite terminal, or intercalary, spherical vesicles, which may probably be regarded as reproductive organs—either oogonia or sporangia. A minute Fungus bearing spores, discovered in 1859 by Mr. Barrow, and named by him Obkhyrium Lepidodendri, is referred with much probability to the Cryothyridaceae. Conceptacles containing spores, and strongly suggesting the Cryothyridaceae, have been described and illustrated by Mr. P. F. A. B. Lebour (1882), and one of an Aleioporous, which appears to have undergone decay before fossilization set in. Small sporangia, almost certainly those of Fungi, are very common in the petrified tissues of Palaeozoic plants. Spherical spores, described by Williamson under the name of Zeysporites, are frequent, usually in an isolated state.
Professor Seward, however, has found a Zygosporites in situ, terminating an apparently fungal hypha: he suggests a possible comparison with the mould Mucor. Bodies closely resembling the perithecia of Sphaeriaces Fungi have often been observed on impressions of Palaeozoic plants, and may probably belong to the group indicated. Professor F. E. Weiss has obtained interesting evidence that the symbiotic association between roots and Fungi, known as "Mycorrhiza," already occurred among Carboniferous plants. The few and imperfect records as to Palaeozoic Fungi do not as yet justify any inferences as to the evolution of these plants. The writer is not aware of any evidence for the occurrence of Palaeozoic Lichens.

The important class of the Bryophyta, which, on theoretical grounds, is commonly regarded as more primitive than the Pteridophyta, is as yet scarcely represented among Palaeozoic fossils. In the Lower Carboniferous of Scotland Mr Kidston has found several specimens of a large dichotomous thallus, with a very distinct midrib; the specimens, referred to the provisional genus Thalstites, much resemble the larger thalloid Liverworts. Similar fossils have been described from still older rocks. In one or two cases Palaeozoic plants, resembling the true Mosses in habit, have been discovered; the best example is the Muscites polytrichaceus of Renault and Zellner, from the Coal Measures of Cirencester. In the absence, however, both of reproductive organs and of anatomical structure, it cannot be said that there is at present conclusive evidence for the existence of either Hepaticae or Musci in Palaeozoic times.

Our knowledge of the Vascular Cryptograms of the Palaeozoic period, though recent discoveries have somewhat reduced their relative importance, is still more extensive than of any other class of plants, and in fact it is here that the evidence of Palaeontology first becomes of essential importance to the botanist. They extend back through the Devonian, possibly to the Silurian system, but the systematic arrangement now to be given is based primarily on the rich materials afforded by the Carboniferous and Permian formations, from which our detailed knowledge of Palaeozoic plants has been chiefly derived.

In addition to the three classes, Equisetales, Lycopodiales and Filicales, under which recent Pteridophytes naturally group themselves, a fourth class, Sphenophyllales, existed in Palaeozoic times, usually related to the Horsetails and more remotely to the Ferns and perhaps the Club-mosses, but with peculiarities of its own demanding an independent position. We further find that, whereas the Ferns of the present day form a well-defined and even isolated class, this was not the case at the time when the primary rocks were deposited. A great group of Palaeozoic fossils, showing evident affinity to Ferns, has proved to consist of seed-bearing plants allied to Gymnosperms, especially Cycads. This important class of plants will be described at the beginning of the Spermophyta under the name Pteridospermaeae. The arrangement which we shall adopt for the Palaeozoic Pteridospermaeae is therefore as follows:

I. Equisetales.
II. Sphenophyllales.
III. Lycopodiales.
IV. Filicales.

We must bear in mind that throughout the Palaeozoic period, and indeed far beyond it, vascular plants, so far as the existing evidence shows, were represented only by the Pteridosperms and Gymnosperms. Although the history of the Angiosperms may probably go much further back than present records show, there is no reason to suppose that they were present, incomplete, which we at present regard as a Palaeozoic vegetableetum. However, the Pteridosperms and Gymnosperms have a sequentia, the Pteridosperms, Gymnosperms and their allies had the field to themselves, so far as regards the higher plants, and filled places in nature which have now for the most part been seized on by families of more modern origin. Hence it is not surprising to find that the early Vascular Cryptograms were, beyond comparison, more varied and more highly organized than their displaced and often degraded successors. It is among the fossils of the Palaeozoic rocks that we first learn the possibilities of Pteridospermic organization.

I. Equisetales.—This class, represented in the recent flora by the single genus Equisetum, with about twenty species, was one of the dominant groups of plants in Carboniferous times. The Calamariae, now known to have been the chief Palaeozoic representatives of the Horsetail stock, attained the dimensions of the bigger trees, according to Goeppert and Eury, a height of from 30 to 60 metres, and showed all the organs of a higher and more varied organization than their recent successors.

Their remains occur in three principal forms of preservation. (1) carbonaceous impressions of the branching, thalloidal, and extremities of other organs; (2) casts of the stem; these are usually internal, or medullary casts, as described above. Around the cast the organic tissues may be represented by a carbonaceous layer, on the surface, and in the outer layers of the stem, as the appearance of the remains of leaves, can sometimes be traced. More usually, however, the carbonaceous film is thin, and merely shows the impress of the medullary cast within; (3) petrified specimens of all parts—stem, roots, leaves and fructifications—found, with a much degraded structure, more or less perfectly preserved. The correlation of these various remains presents considerable difficulties. Casts surrounded by wood, with its structure preserved, have sometimes been found, and it has been repeatedly shown, that the branches of the branches is shown both on casts and in petrifed specimens, and has helped in their identification, while the petrified remains sometimes show external of the external characters to allow of their correlation. We may observe, that specimens from Carboniferous strata have been found in connexion with leafy shoots, and the carbonaceous film of the axis in sterile and fertile specimens has proved a valuable means of identification.

In 1870, the Calamariae appear to have borne, on the whole, a general resemblance to the recent Equisetaceae, in spite of their enormously greater bulk. The leaves were constantly in whors, and were used of comparatively small size and of simple form. In the oldest known Carboniferous Calamaria, however, Archaeocalamites (Devonian and Lower Carboniferous), the branches were quadrarily forked. There is evidence that in some, at least, of the Calamariae the leaves of each verticil were united at the base to form a sheath.

The free lamina, however, was always considerably more developed and complex than the sheath or the blade. In the Carboniferous Ferns, the leaves were usually divided into two series, the sterile or branchy and the fertile or lanceolate. Different genera have been founded on leaf-bearing branches of Calamariae; apart from Archaeocalamites, already mentioned, and Autophyllites (Grand' Eury), in both of which the leaves are simple or bifid, the Calamites and Calamocladus (in Grand' Eury's limited sense), with simple leaves. In some species of Annularia the extremely delicate ultimate twigs, bearing whors of small lanceolate leaves, give a characteristic appearance. These ferns were, however, branches of leafy, cone-bearing plants; other Annulariaceae, however, have been traced with certainty into connexion with the stems of large Calamites. In Asterophyllites, the generic distinction of which from Annularia is not always clear, the narrow lanceolate leaves are in crowded whors, and the ultimate branches distichously arranged; in the Calamocladus of Grand' Eury—characteristic of the Upper Coal Measures—the whors are more remote, and the twigs polystichous in arrangement. In all these cases the nodes have been relatively elongate.

The distribution of the branches on the main stem, however, shows considerable variations, on which genera or sub-genera have been founded by C. E. Weiss. In Archaeocalamites, which certainly existed in large measure in the Carboniferous, the internodes are long, and occur on every node, but only in certain parts of the stem; the ribs of successive internodes do not alternate, but are continuous, indicating that the leaves were superposed. Using Calamites as a generic name for this series, it is to them, when the ribs alternate at the nodes, we have, on Weiss's system, the following sub-genera: Calamites, branches rare and irregularly arranged; Calamitina, branches in regular verticils, limited to certain nodes, which surmount short intercalary Calamites, branches present on every node. These distinctions can be more accurately recognized on Calamites, as well as on the casts, but their taxonomic value is somewhat doubtful. In many Calamites there is evidence that the aerial branch is divided into a horizontal rhizome, as in the common species C. {Stylocalamites} Seward. In other specimens the aerial stem has an independent, rooting base.

The anatomical structure of all parts of the plant is now known, in various Calamariae, thanks more especially to the work of Willwood and Engler. It presents in the smaller branches a structure which may be briefly characterized as that of an Equisetum with secondary growth in thickness (fig. 1, Plate). The usually fuscous pith is surrounded by a ring of collateral vascular bundle, which, as in Equisetum, is ringed by the ground tissue, the cortex, which, with rare exceptions, has an intercellular canal at its inner edge, containing the disorganized spiral tracheae, just as in the recent genus. The cortex is often preserved; in certain cases it was observed, in the hands of the writer, to be 60 metres thick. It is only in the rare cases where a very young twig is preserved that the primary structure of the stem is found unaltered. In all the larger specimens a broad zone of wood, with its elements in radial series, has been added. This zone, as in the true Calamites (Arthopyritus, Goepert), has a simple structure, comparable to that of the simplest Coniferous woods; it is made up
Fig. 1.—Calamites. Part of transverse section of a young stem, showing pith, vascular bundles with secondary wood, and cortex. (× about 40.) From a photograph (Scott, "Studies").

Fig. 2.—Lyginodendron oldhamianum. Transverse section of stem, showing the pith containing groups of sclerotic cells, the primary xylem-strands, secondary wood and phloem, pericycle and cortex. II, leaf-traces, numbered according to the phylletaxis, \( \frac{5}{4} \) belonging to the lowest leaf of the five; \( \frac{6}{4} \), a group of primary phloem; \( \frac{7}{4} \), periderm, formed from pericycle. (× 5.)

Fig. 3.—Sphenophyllum insignis. Transverse section of stem, showing triangular primary wood, secondary wood, remains of phloem, and primary cortex. (× about 30.) From a photograph (Scott, "Studies").

Fig. 4.—Palaeotheckia pedunculata. Fertilized shoot, bearing numerous cones and a few leaves. (\( \frac{1}{3} \) of nat. size.) After Williamson (Scott, "Studies").

Fig. 5.—Cordaites Forst. A. Male exine in longitudinal section: a, axis; b, leaflets; c, d, laminae of stamens, bearing the pollen-sacs (f and j) at the top; e, apex of axis. (× 60.) B. Stamens more highly magnified: f, vascular bundle of laminae; g, pollen-sacs, after delusion. (× 23.) After Remani (Scott, "Studies").
entirely of radial bands of tracheids interspersed with medullary rays. The pitting of the tracheids is more or less scalariform in character, and is limited to the radial walls. In favourable cases remains of the cambium are found on the outer border of the wood, and phloem is also present in the northern groups. It does not seem to have attained any considerable thickness. In the old stems the primary cortex was replaced by periderm, giving rise to a thick mass of bark. The above description applies to the structure of the axes (as far as the British Coal Measures are concerned) only. The specimens from the Lower Carboniferous (Lower Coal Measures in Britain) were assigned by the French authors to the genus Archaeocalamites. The same genus, Protocalamites petricensis, centripetal wood was present in the stem. In Calamodendron (Upper Coal Measures) the wood has a more complex structure than in Calamites, the principal rays including radial tracts of fibrous wood in addition to the usual parenchyma. Archaeocalamites, Protocalamites, and Calamodendron (Lower Coal Measures) approaches Calamodendron in this respect. The longitudinal course of the vascular bundles and their relation to the leaves in Calamariaeae generally followed the Equisetum type, though their number and size was usually variable and sometimes more complex. The development of the branches was immediately above the node, and usually between two foliar traces, as in the recent genus. Where the structure of the leaves is preserved it proves to be of an extremely simple type; the narrow lamina is separated by a single vascular bundle, separated by a sheath from the surrounding palisade parenchyma. Stomata of the same structure as in Equisetum have been detected in the epidermis.

The roots (formerly described as a separate genus, Astromylon) were borne directly on the nodes, not on short lateral branches as in Equisetum. They are of similar structure in all known Calamariaeae, the main roots having a large pith, while the rootlets had little xylem and phloem. The latter is in all respects a typical root, as shown by the centripetal primary wood, and the alternation of xylem and phloem groups observable in exceptionally favourable young specimens. A striking feature is that the roots where the young roots have a double endoderm, just as in the recent Equisetum.

A considerable number of Calamarian fructifications are known; preserved, some as carbonaceous impressions, others as petrified specimens, displaying the internal structure. In many cases the cones have been found in connexion with branches bearing characteristic Calamarian foliage. Almost all strobili of the Calamariaeae are constructed on the same general plan as those of Equisetum, with which some agree exactly; in most, however, the organization was more complex, the complexity consisting in the intercalation of whorls of sterile bracts, between those of the sporangiophores. In several cases heterospory, unknown among recent Equisetaceae, has been demonstrated in their Palaeozoic representatives.

Four main types of structure may be distinguished among Calamarian strobili—

1. Calamostachys, Schimper. Here the whorls of peltate sporangiophores alternate regularly with those of sterile bracts, the former being inserted on the axis midway between the latter (fig. 2). The sporangiophores usually half as numerous in each verticil as the bracts, have the same form as in Equisetum, but each bears four sporangiophores only. The spores are occasionally found to be still united in tetrads. In some species, e.g. the British C. Binneyana, numerous specimens have been examined and each verticil has only one kind of spore observed; here, then, there is a strong presumption that the species was homosporous. In other species, however, e.g. C. Casheana, Will, two kinds of spore occur, in different sporangiophores, but on the same strobili and verticils (fig. 3). The megasporophores, of which there are many in the megasporangium, have a diameter about three times that of the microsporophores. There are certain spores, which is known to have taken place both in the homosporous C. Binneyana and in the heterosporous C. Casheana, that throw some light on the origin of the heterosporous condition. The bracts were sometimes coherent in their lower part, and, in C. Binneyana, sometimes free (e.g. C. Ludwigi); in C. Casheana, all the cases their free extremities formed a protection to the fertile portion. Where some continental species (e.g. C. Grand' Eury, Ren.) radial membranous plates hung down from each verticil, forming compartments in which the subjacent sporangiophores were enclosed. The anatomy of the axis is essentially similar to that of a young Calamarian twig, with some variations in detail. Strobili of the Calamostachys type occur in connexion both with Annularia and Asterophyllites foliage.

2. Palaeostachya, Weiss. Here, as in the previous genus, sterile and fertile verticils are arranged alternately on the axis of the cone. The main difference is that in Palaeostachya the sporangiophores, instead of standing midway between the whorls of bracts, are inserted immediately above them, springing, as it were, from the axis of the sterile verticil (fig. 3, A). This singular arrangement has suggested doubts as to the correctness of the current interpretation of the Equisetaceous sporangiophore as a modified leaf.

3. Equisetum type of strobili. In certain cases the strobili of Palaeozoic Calamariaeae appear to have had essentially the same organization as in the recent genus, the axis bearing sporangiophores only, without intercalated bracts. It is remarkable that fructifications apparently of this kind have been found by Renaut in close association with the most ancient of the Calamariaeae—Archaeocalamites. In these strobili the peltate scales, like the vegetative leaves of the plant, are in superfused verticils; each appears to have borne four sporangia only. Other cases, however, namely, those known as Pothoecites, have also been attributed on good grounds to the genus Archaeocalamites; they are long strobili, constructed at intervals, and it is probable that the succession of fertile sporangiophores was interrupted here and there by the intercalation of sterile bracts, which may also have been present, at long intervals, in Renaut's species. Cones from the Middle Coal Measures, described by Kidston under the name of Equisetum Henningsianum, but probably belonging to one of the Calamariaeae, bear a striking external resemblance to those of a recent Equisetum.

4. Cingularia, Weiss. This form of strobili, from the Coal Measures of Italy, is imperfectly known, and its relation to Calamariaeae not beyond doubt. In the last strobili the sporangiophores, which are not peltate, but strap-shaped, were borne, as C. E. Weiss first showed, immediately below the verticils of bracts, the position thus being the reverse of that in Palaeostachya.

The Palaeozoic Calamariaeae, though so far surpassing recent Equisetaceae, both in stature and complexity of organization, clearly belonged to the same class of Vascular Cryptogams. There is no satisfactory evidence for attributing Phanerogamic
affinities to any members of the group, and the view, of which Williamson was the chief advocate, that they form a homogeneous Cryptozamia family, is now fully established.

II. Sphenophylales.—The class of Sphenophylales, as known to us at present, is of limited extent, embracing the two genera Sphenophyllum and Cheirostrobus, which may serve as types of two families within the class. The characters of Sphenophyllum are known with some completeness, while our knowledge of Cheirostrobus is confined to the fructification; the former will therefore be described first.

1. Sphenophyllum.—The genus Sphenophyllum, of which a number of species have been described, ranging from the Middle Devonian, through the Carboniferous, to the Permian or even the Lower Triassic, consisted of herbaceous plants of moderate dimensions. The long, slender stems, somewhat tubed at the nodes, were ribbed, the ribs running continuously throughout the stems, a fact correlated with the incompressibility of the whole leaf, the number of which in each verticil was some multiple of 3, and usually 6. In the species on which the genus was founded, the leaves, as the generic name implies, are cuneate and entire, or toothed on their anterior margin; in other cases they are simply divided into dichotomy into narrow segments, or the whorl consists of a larger number (up to 30) of apparently simple, linear leaves, which may represent the segments of a smaller number. The different forms of leaf may occur on the same plant, the deeply divided foliage often characterizing the main stem, while the cuneate leaves were borne on lateral shoots. A comparison, formerly suggested, with the two forms of leaf in Batrachian Ranunculus has not proved to be a good one: the idea of an aquatic habit is contradicted by the anatomical structure, and the hypothesis that the plants were of scandent growth is more probable.

The species of Sphenophyllum have a graceful appearance, which has been compared with that of a shepherd's staff. Branches sprang from the nodes, though perhaps not truly axillary in position. The cones, more or less sharply differentiated, terminated certain of the branches.
